If any *positive* signification, distinct from what we mean by pleasure, can be affixed to the term *happiness*, it may be taken to denote a certain state of the nervous system in that part of the human frame in which we feel joy and grief, passions and affections. Whether this part be the heart, which the turn of most languages would lead us to believe; or the diaphragm, as Buffon, or the upper orifice of the stomach, as Van Helmont thought; or rather be a kind of fine network, lining the whole region of the præcordia, as others have imagined; it is possible not only that every painful sensation may violently shake and disturb the fibres at the time, but that a series of such may at length so derange the very texture of the system, as to produce a perpetual irritation, which will show itself by fretfulness, restlessness, and impatience. It is possible also, on the other hand, that a succession of pleasurable sensations may have such an effect upon this subtle organization, as to cause the fibres to relax, and return into their place and order; and thereby to recover, or if not lost to preserve, that harmonious conformation which gives to the mind its sense of complacency and satisfaction. This state may be denominated *happiness*: And is so far distinguishable from pleasure, that it does not refer to any particular object of enjoyment, or consist like pleasure in the gratification of one or more of the senses; but is rather the secondary effect which such objects and gratifications produce upon the nervous system, or the state in which they leave it. The comparative sense, however, in which we have explained the term *happiness*, is more popular; and in prosecuting the subject, we may consider, 1. What human happiness does not consist in; and, 2. What it does consist in.

1. *First*, then, happiness does not consist in the pleasures of sense, in whatever profusion or variety they be enjoyed. By the pleasures of sense are meant, as well the animal gratifications of eating, drinking, and that by which the species is continued, as the more refined pleasures of music, painting, architecture, gardening, splendid shows, theatric exhibitions, and the pleasures, lastly, of active sports, as of hunting, shooting, fishing, &c. For, 1. These pleasures continue but for a little while at a time. This is true of them all, especially of the grosser sort. Laying aside the preparation and the expectation, and computing strictly the actual sensation, we shall be surprised to find how inconsiderable a portion of our time they occupy, how few hours in the four and twenty they are able to fill up. 2. By repetition, they lose their relish. It is a property of the machine, for which we know no remedy, that the organs by which we perceive pleasure are blunted and benumbed, by being frequently exercised in the same way. There is hardly any one who has not found the difference between a gratification when new and when familiar, and any pleasure which does not become indifferent as it grows habitual. 3. The eagerness for high and intense delights takes away the relish from all others; and as such delights fall rarely in our way, the greater part of our time becomes from this cause empty and uneasy. There is hardly any delusion by which men are greater sufferers in their happiness, than by their expecting too much from what

Happiness. what is called *pleasure*; that is, from those intense delights which vulgarly engross the name of pleasure. The very expectation spoils them. When they do come, we are often engaged in taking pains to persuade ourselves how much we are pleased, rather than enjoying any pleasure which springs naturally out of the object. And whenever we depend upon being vastly delighted, we always go home secretly grieved at missing our aim. Likewise, as hath been observed just now, when this humour of being prodigiously delighted has once taken hold of the imagination, it hinders us from providing for or acquiescing in those gently soothing engagements, the due variety and succession of which are the only things that supply a continued stream of happiness.

The truth seems to be, that there is a limit at which these pleasures soon arrive, and from which they ever afterwards decline. They are by necessity of short duration, as the organs cannot hold on their emotions beyond a certain length of time; and if you endeavour to compensate for this imperfection in their nature by the frequency with which you repeat them, you lose more than you gain by the fatigue of the faculties and the diminution of sensibility. We have in this account said nothing of the loss of opportunities or the decay of faculties, which whenever they happen leave the voluptuary destitute and desperate; teased by desires that can never be gratified, and the memory of pleasures which must return no more. It will also be allowed by those who have experienced it, and perhaps by those alone, that pleasure which is purchased by the encumbrance of our fortune is purchased too dear; the pleasure never compensating for the perpetual irritation of embarrassed circumstances.

These pleasures, after all, have their value: and as the young are always too eager in their pursuit of them, the old are sometimes too remiss; that is, too studious of their ease to be at the pains for them which they really deserve.

Secondly, Neither does happiness consist in an exemption from pain, labour, care, business, suspense, molestation, and "those evils which are without;" such a state being usually attended not with ease, but with depression of spirits, a tastelessness in all our ideas, imaginary anxieties, and the whole train of hypochondriacal affections. For which reason it seldom answers the expectations of those who retire from their shops and counting-houses to enjoy the remainder of their days in leisure and tranquillity; much less of such as in a fit of chagrin shut themselves up in cloysters and hermitages, or quit the world and their stations in it for solitude and repose.

Where there exists a known external cause of uneasiness, the cause may be removed, and the uneasiness will cease. But those imaginary distresses which men feel for want of real ones (and which are equally tormenting, and so far equally real); as they depend upon no single or assignable subject of uneasiness, so they admit oft-times of no application or relief. Hence a moderate pain, upon which the attention may fasten and spend itself, is to many a refreshment; as a fit of the gout will sometimes cure the spleen. And the same of any moderate agitation of the mind, as a literary controversy, a law-suit, a contested election, and above all gaming; the passion for which, in men of

fortune and liberal minds, is only to be accounted for **Happiness.** on this principle.

Thirdly, Neither does happiness consist in greatness, rank, or elevated station.

Were it true that all superiority afforded pleasure, it would follow, that by how much we were the greater, that is, the more persons we were superior to, in the same proportion, so far as depended upon this cause, we should be the happier; but so it is, that no superiority yields any satisfaction, save that which we possess or obtain over those with whom we immediately compare ourselves. The shepherd perceives no pleasure in his superiority over his dog; the farmer in his superiority over the shepherd; the lord in his superiority over the farmer; nor the king, lastly, in his superiority over the lord. Superiority, where there is no competition, is seldom contemplated; what most men indeed are quite unconscious of. But if the same shepherd can run, fight, or wrestle, better than the peasants of his village; if the farmer can show better cattle, if he keeps a better horse, or be supposed to have a longer purse, than any farmer in the hundred; if the lord have more interest in an election, greater favour at court, a better house, or larger estate, than any nobleman in the county; if the king possess a more extensive territory, a more powerful fleet or army, a more splendid establishment, more loyal subjects, or more weight and authority in adjusting the affairs of nations, than any prince in Europe; in all these cases, the parties feel an actual satisfaction in their superiority. No superiority appears to be of any account but a superiority over a rival. This, it is manifest, may exist wherever rivalships do; and rivalships fall out amongst men of all ranks and degrees. The object of emulation, the dignity or magnitude of this object, makes no difference; as it is not what either possesses that constitutes the pleasure, but what one possesses more than the other. Philosophy smiles at the contempt with which the rich and great speak of the petty strifes and competitions of the poor; not reflecting that these strifes and competitions are just as reasonable as their own, and the pleasure which success affords the same.

It appears evident then, that happiness does not consist in greatness; since what are supposed to be the peculiar advantages of greatness, the pleasures of ambition and superiority, are in reality common to all conditions. But whether the pursuits of ambition be ever wise, whether they contribute more to the happiness or misery of the pursuers, is a different question; and a question concerning which we may be allowed to entertain great doubt. The pleasure of success is exquisite; so also is the anxiety of the pursuit, and the pain of disappointment; and what is the worst part of the account, the pleasure is short lived. We soon cease to look back upon those whom we have left behind; new contests are engaged in, new prospects unfold themselves; a succession of struggles is kept up, whilst there is a rival left within the compass of our views and profession; and when there is none, the pleasure with the pursuit is at an end.

II. We have seen what happiness does *not* consist in. We are next to consider in what it *does* consist. In the conduct of life, the great matter is, to know beforehand what will please us, and what pleasures will

Happiness. hold out. So far as we know this, our choice will be justified by the event. And this knowledge is more rare and difficult than at first sight it may seem to be: For sometimes pleasures, which are wonderfully alluring and flattering in the prospect, turn out in the possession extremely insipid; or do not hold out as we expected: at other times pleasures start up, which never entered into our calculation, and which we might have missed of by not foreseeing; from whence we have reason to believe, that we actually do miss of many pleasures from the same cause.

By reason of the original diversity of taste, capacity, and constitution, observable in the human species, and the still greater variety which habit and fashion have introduced in these particulars; it is impossible to propose any plan of happiness which will succeed to all, or any method of life which is universally eligible or practicable. All that can be said is, that there remains a presumption in favour of those conditions of life in which men generally appear most cheerful and contented. For though the apparent happiness of mankind be not always a true measure of their real happiness, it is the best measure we have.

Upon this principle, then, happiness appears to consist,

1. In the exercise of the social affections.—Those persons commonly possess good spirits who have about them many objects of affection and endearment; as wife, children, kindred, friends: and to the want of these may be imputed the peevishness of monks, and of such as lead a monastic life. Of the same nature with the indulgence of our domestic affections, and equally refreshing to the spirits, is the pleasure which results from acts of bounty and beneficence, exercised either in giving money, or in imparting to those who want it the assistance of our skill and profession.

2. Another main article of human happiness is, the exercise of our faculties, either of body or mind, in the pursuit of some engaging end.

It seems to be true, that no plenitude of present gratifications can make the possessor happy for a continuance, unless he have something in reserve, something to hope for and look forward to. This may be inferred from comparing the alacrity and spirits of men who are engaged in any pursuit which interests them, with the dejection and *ennui* of almost all who are either born to so much that they want nothing more, or who have *used up* their satisfactions too soon and drained the sources of them. It is this intolerable vacuity of mind which carries the rich and great to the horse-course and the gaming table; and often engages them in contests and pursuits of which the success bears no proportion to the solicitude and expence with which it is sought.

The question now occurs, How we are to provide ourselves with a succession of pleasurable engagements? This requires two things: Judgment in the choice of ends adapted to our opportunities; and a command of imagination, so as to be able, when the judgment has made choice of an end, to transfer a pleasure to the means; after which the end may be forgotten as soon as we will. Hence those pleasures are most valuable, not which are most exquisite in the fruition, but most productive of engagement and activity in the pursuit.

A man who is in earnest in his endeavours after the

happiness of a future state, has in this respect an advantage over all the world. For he has constantly before his eyes an object of supreme importance, productive of perpetual engagement and activity, and of which the pursuit (which can be said of no pursuit besides) lasts him to his life's end. Yet even he must have many ends beside the far end; but then they will conduct to that, be subordinate, and in some way or other capable of being referred to that, and derive their satisfaction, or an addition of satisfaction, from that.

Engagement is every thing. The more significant, however, our engagements are, the better; such as the planning of laws, institutions, manufactures, charities, improvements, public works, and the endeavouring by our interest, address, solicitations, and activity, to carry them into effect: Or, upon a smaller scale, the procuring of a maintenance and fortune for our families, by a course of industry and application to our callings, which forms and gives motion to the common occupations of life; training up a child; prosecuting a scheme for his future establishment; making ourselves masters of a language or a science; improving or managing an estate; labouring after a piece of preferment: And, lastly, any engagement which is innocent is better than none; as the writing of a book, the building of a house, the laying out of a garden, the digging of a fish-pond; even the raising of a cucumber or a tulip. Whilst the mind is taken up with the objects or business before it, we are commonly happy, whatever the object or business be: when the mind is absent, and the thoughts are wandering to something else than what is passing in the place in which we are, we are often miserable.

3. The art in which the secret of human happiness in a great measure consists, is to set the habits in such a manner, that every change may be a change for the better. The habits themselves are much the same; for whatever is made habitual becomes smooth, and easy, and indifferent. The return to an old habit is likewise easy, whatever the habit be. Therefore the advantage is with those habits which allow of indulgence in the deviation from them. The luxurious receive no greater pleasure from their dainties than the peasant does from his bread and cheese; but the peasant whenever he goes abroad finds a feast, whereas the epicure must be well entertained to escape disgust. Those who spend every day at cards, and those who go every day to plough, pass their time much alike; intent upon what they are about, wanting nothing, regretting nothing, they are both in a state of ease: But then, whatever suspends the occupation of the card-player distresses him; whereas to the labourer, every interruption is a refreshment: and this appears in the different effect that the Sabbath produces upon the two, which proves a day of recreation to the one, but a lamentable burden to the other. The man who has learned to live alone, feels his spirits enlivened whenever he enters into company, and takes his leave without regret: another, who has long been accustomed to a crowd or continual succession of company, experiences in company no elevation of spirits, nor any greater satisfaction than what the man of a retired life finds in his chimney-corner. So far their conditions are equal: but let a change of place, fortune, or situation, separate the companion from his circle, his visitors, his club,

Happiness. club, common-room, or coffee house, and the difference of advantage in the choice and constitution of the two habits will show itself. Solitude comes to the one clothed with melancholy; to the other it brings liberty and quiet. You will see the one fretful and restless, at a loss how to dispose of his time, till the hour comes round that he can forget himself in bed: the other easy and satisfied, taking up his book or his pipe as soon as he finds himself alone; ready to admit any little amusement that casts up, or to turn his hands and attention to the first business that presents itself; or content without either to sit still, and let his trains of thought glide indolently through his brain, without much use perhaps or pleasure, but without hankering after any thing better and without irritation. A reader who has inured himself to books of science and argumentation, if a novel, a well written pamphlet, an article of news, a narrative of a curious voyage, or the journal of a traveller, fall in his way, sits down to the repast with relish, enjoys his entertainment while it lasts, and can return when it is over to his graver reading without distaste. Another, with whom nothing will go down but works of humour and pleasantry, or whose curiosity must be interested by perpetual novelty, will consume a bookseller's window in half a forenoon; during which time he is rather in search of diversion than diverted: and as books to his taste are few and short and rapidly read over, the stock is soon exhausted, when he is left without resource from this principal supply of innocent amusement.

So far as circumstances of fortune conduce to happiness, it is not the income which any man possesses, but the increase of income that affords the pleasure. Two persons, of whom one begins with 100*l.* and advances his income to 1000*l.* a-year; and the other sets off with 1000*l.* and dwindles down to 100*l.* may, in the course of their time, have the receipt and spending of the same sum of money: yet their satisfaction, so far as fortune is concerned in it, will be very different: the series and sum total of their incomes being the same, it makes a wide difference which end they begin at.

4. Happiness consists in health; understanding by health, not only freedom from bodily distempers, but also that tranquillity, firmness, and alacrity of mind, which we call *good spirits*. For the sake of health, according to this notion of it, no sacrifices can be too great. Whether it require us to relinquish lucrative situations, to abstain from favourite indulgences, to control intemperate passions, or undergo tedious regimens; whatever difficulties it lays us under, a man, who pursues his happiness rationally and resolutely, will be content to submit to. When we are in perfect health and spirits, we feel in ourselves a happiness independent of any particular outward gratification whatever, and of which we can give no account. This is an enjoyment which the Deity has annexed to life; and probably constitutes, in a great measure, the happiness of infants and brutes, especially of the lower and sedentary orders of animals, as of oysters, periwinkles, and the like.

The above account of human happiness will justify these two conclusions, which, although found in most books of morality, have seldom been supported by any

sufficient reasons: 1. "That happiness is pretty equally distributed amongst the different orders of civil society; and, 2. That vice has no advantage over virtue, even with respect to this world's happiness."

HAQUE, in our old writers, a little hand-gun, prohibited to be used for destruction of game, &c. by statute 33 Hen. VIII. cap. 6. and 2 & 3 Ed. VI. cap. 14. There is also the half-haque, or demi-haque, within the said acts.

HARAM. See **SERAGLIO**.

HARAN, otherwise **CHARRÆ** in Mesopotamia, a city celebrated for having been the place where Abraham first retreated after he left Ur (Gen. xi. 31, 32); and where Terah, Abraham's father, died and was buried. Thither it was likewise that Jacob retired to Laban when he fled from the indignation of his brother Esau (id. xxvii. 45. xxviii. 10, &c.) Lastly, at Haran or Charræ in Mesopotamia, Crassus the Roman general was defeated and killed by the Parthians. Haran was situated between the Euphrates and the river Chebar, at a good distance from the place where these two rivers join.

HARANGUE, a modern French name for a speech or oration made by an orator in public.—Menage derives the word from the Italian *arenga*, which signifies the same; formed, according to Ferrari, from *arringo*, "a just, or place of justing." Others derive it from the Latin *ara*, "altar;" by reason the first harangues were made before altars: whence the verse of Juvenal,

Aut Lugdunensis rector dicturus ad aram.

HARANGUES were usually made by the generals, previous to an engagement both amongst the Greeks and Romans. An harangue on such occasions was called *allocutio*. See **ALLOCUTIO**.

The word is also frequently used in an ill sense, viz. for a too pompous, prolix, or unseasonable speech or declamation.

HARBINGER, an officer of the king's household, having four yeomen under him, who ride a day's journey before the court when it travels, to provide lodgings, &c.

HARBOROUGH, a town of Leicestershire, 84 miles from London. It is a great thoroughfare in the road to Derby, near the source of the river Welland; and was famous, in Camden's time, for its beast fair, where the best horses and colts are still sold. Its fairs are April 29. and Oct. 19. The market is on Tuesday, for the use of which the Earl of Harborough has lately built a neat market-house at his own expence. Here is a good free-school, and a fair chapel of ease to Great-Bowden its parish.

HARBOUR, a general name given to any sea-port or haven; as also to any place convenient for mooring shipping, although at a great distance from the sea. The qualities requisite in a good harbour are, that the bottom be entirely free from rocks or shallows; that the opening be of sufficient extent to admit the entrance or departure of large ships without difficulty; that it should have good anchoring-ground, and be easy of access; that it should be well defended from the violence of the wind and sea; that it should have room and convenience to receive the shipping of different nations, and those which are laden with different merchandises; that it be furnished with a good light-house, and have variety of proper rings, posts, moorings, &c.

Haque

Hardness.

ings, &c. in order to remove or secure the vessels contained therein; and, finally, that it have plenty of wood, and other materials for firing, besides hemp, iron, mariners, &c.

HARBURG, a small town of Germany, in the circle of Lower Saxony, and duchy of Lunenburg, seated on the river Elbe over against Hamburg. It was surrounded with walls in 1355; and 30 years after, a strong castle, which still remains, was built by the bishop. E. Long. 9. 41. N. Lat. 53. 51.

HARDENING, the giving a greater degree of hardness to bodies than they had before.

There are several ways of hardening iron and steel, as by hammering them, quenching them in cold water, &c. See STEEL.

Case-HARDENING. See CASE-Hardening.

HARDERWICK, a town of the United Provinces, in Dutch Guelderland. It is a well-built town, and the chief of the sea-ports of this province. It has several good buildings, particularly the great church, which is much admired. In 1648 the public school here was turned into an university. The French did it a great deal of damage in 1672; since which time it has been on the decline. E. Long. 5. 37. N. Lat. 52. 14.

HARDNESS, in bodies, a property directly opposite to fluidity; by which they resist the impression of any other substance, sometimes in an extreme degree. As fluidity has been found to consist in the motion of the particles of a body upon one another in consequence of a certain action of the universal fluid or elementary fire among them; we must conclude that hardness consists in the absence of this action, or a deficiency of what is called *latent heat*. This is confirmed by observing, that there is an intermediate state betwixt hardness and fluidity, in which bodies will yield to a certain force, though they still make a considerable resistance. This is principally observed in the metals, and is the foundation of their ductility. It appears, indeed, that this last property, as well as fluidity, is entirely dependent on a certain quantity of latent heat absorbed, or otherwise acting within the substance itself; for all the metals are rendered hard by hammering, and soft by being put again into the fire and kept there for some time. The former operation renders them hot as well as hard; probably, as Dr Black observes, because the particles of metal are thus forced nearer one another, and those of fire squeezed out from among them. By keeping them for some time in the fire, that element insinuates itself again among the particles, and arranges them in the same manner as before, so that the ductility returns. By a second hammering this property is again destroyed, returning on a repetition of the heating, or *annealing* as it is called; and so on, as often as we please.

Hardness appears to diminish the cohesion of bodies in some degree, though their fragility does not by any means keep pace with their hardness. Thus, glass is very hard and very brittle; but flint, though still harder than glass, is much less brittle. Among the metals, however, these two properties seem to be more connected, though even here the connection is by no means complete. Steel, the hardest of all the metals, is indeed the most brittle; but lead, the softest, is not the most ductile. Neither is hardness connected with

the specific gravity of bodies; for a diamond, the hardest substance in nature, is little more than half the weight of the lightest metal. As little is it connected with the coldness, electrical properties, or any other quality with which we are acquainted: so that though the principle above laid down may be accepted as a general foundation for our inquiries, a great number of particulars remain yet to be discovered before we can offer any satisfactory explanation.

All bodies become harder by cold; but this is not the only means of their doing so, for some become hard by heat as well as cold. Thus, water becomes hard by cold when it is frozen, but it becomes much harder when its steam is passed over red-hot iron, and it enters the substance of the metal, by an union with which it becomes almost as hard as glass.

Mr Quist and others have constructed tables of the hardness of different substances. The method pursued in constructing these tables was by observing the order in which they were able to cut or make any impression upon one another. The following table, extracted from M. Magellan's edition of Cronstedt's Mineralogy, was taken from Dr Quist, Bergman, and Mr Kirwan. The first column shows the hardness, and the second the specific gravity.

Diamond from Ormus	-	20	—	3,7
Pink diamond	-	19	—	3,4
Bluish diamond	-	19	—	3,3
Yellowish diamond	-	19	—	3,3
Cubic diamond	-	18	—	3,2
Ruby	-	17	—	4,2
Pale ruby from Brazil	-	16	—	3,5
Ruby spinell	-	13	—	3,4
Deep blue sapphire	-	16	—	3,8
Ditto paler	-	17	—	3,8
Topaz	-	15	—	4,2
Whitish ditto	-	14	—	3,5
Bohemian ditto	-	11	—	2,8
Emerald	-	12	—	2,8
Garnet	-	12	—	4,4
Agate	-	12	—	2,6
Onyx	-	12	—	2,6
Sardonyx	-	12	—	2,6
Occid. amethyst	-	11	—	2,7
Cryстал	-	11	—	2,6
Cornelian	-	11	—	2,7
Green jasper	-	11	—	2,7
Reddish yellow ditto	-	9	—	2,6
Schoerl	-	10	—	3,6
Tourmaline	-	10	—	3,0
Quartz	-	10	—	2,7
Opal	-	10	—	2,6
Chrysolite	-	10	—	3,7
Zeolyte	-	8	—	2,1
Fluor	-	7	—	3,5
Calcareous spar	-	6	—	2,7
Gypsum	-	5	—	2,3
Chalk	-	3	—	2,7

HARDOUIN (John), a learned French Jesuit in the beginning of the 18th century, known by the remarkable paradoxes he advanced in his writings; this in particular, That all the works of the ancient profane writers, except Cicero's works, Virgil's Georgics, Horace's satires and epistles, and Pliny's natural

Hardness,
Hardouin.

Hardwicke

Hare.

ral history, are mere forgeries. He died at Paris in 1729, aged 83. His principal works are, 1. An edition of Pliny's natural history, with notes, which is much esteemed. 2. An edition of the councils, which made much noise. 3. Chronology restored by medals, 4to. 4. A commentary on the New Testament, folio; in which he pretends that our Saviour and his apostles preached in Latin, &c.

HARDWICKE. See YORK.

HARE, in zoology. See LEPUS.

The hare is a beast of venery, or of the forest, but peculiarly so termed in the second year of her age. There are reckoned four sorts of them, from the place of their abode: some live in the mountains, some in the fields, some in marshes, and some wander about every where. The mountain-hares are the swiftest, the field-hares are not so nimble, and those of the marshes are the slowest: but the wandering hares are the most dangerous to follow; for they are cunning in the ways and mazes of the fields, and, knowing the nearest ways, run up the hills and rocks, to the confusion of the dogs, and the discouragement of the hunters. See the article HUNTING.

Hares and rabbits are very mischievous to new planted orchards, by peeling off the barks of the tender and young trees for their food. They do also the same sort of mischief to nurseries; for the prevention of which, some bind ropes about the trees up to such a height as they are able to reach; some daub them with tar; but though this keeps off the hares, it is itself mischievous to the trees; but this hurtful property of it is in some degree taken off by mixing any kind of fat or grease with it, and incorporating them well over the fire. This mixture is to be rubbed over the lower part of the trees in November, and will preserve them till that time the next year, without any danger from these animals. It is only in the hard weather in the winter season, when other food is scarce, that these creatures feed on the barks of trees.

People who have the care of warrens, pretend to an odd way of making hares fat when they get them there. This is the stopping up their ears with wax, and rendering them deaf. The hare is so timorous a creature, that she is continually listening after every noise, and will run a long way on the least suspicion of danger; so that she always eats in terror, and runs herself out of flesh continually. These are both prevented by her feeding in a safe place, and that without apprehension; and they say she will always readily be fattened in this way.

Though the hare lives on vegetables and water only, yet the habitual exercise of this animal exalts its salts, and renders it somewhat alkaline; and this tendency is much increased, if it is killed immediately after being heated by strong exercise.

Java HARE. See MUS.

HARE's Ear, in botany. See BUPLEURUM.

HARE (Dr Francis), an English bishop, of whose birth we have no particulars, was bred at Eton school, and from that foundation became a member of King's college, Cambridge; where he had the tuition of the marquis of Blandford, only son of the illustrious duke of Marlborough, who appointed him chaplain-general to the army. He afterwards obtained the deanery of Worcester, and from thence was promoted to the bi-

shopric of Chichester, which he held with the deanery of St Paul's to his death, which happened in 1740. He was dismissed from being chaplain to George I. in 1718, by the strength of party prejudices, in company with Dr Moss and Dr Sherlock, persons of distinguished rank for parts and learning.—About the latter end of queen Anne's reign he published a remarkable pamphlet, intitled, *The difficulties and discouragements which attend the study of the scriptures, in the way of private judgment*: in order to shew, that since such a study of the scriptures is an indispensable duty, it concerns all Christian societies to remove, as much as possible, those discouragements. In this work, his manner appeared to be so ludicrous, that the convocation fell upon him, as if he were really against the study of the holy scriptures: and Whiston says, that finding this piece likely to hinder that preferment he was seeking for, he aimed to conceal his being the author. He published many pieces against bishop Hoadly, in the Bangorian Controversy, as it is called; and also other learned works, which were collected after his death, and published in four vols. 8vo. 2. An edition of Terence, with notes, in 4to. 3. The book of Psalms in the Hebrew, put into the original poetical metre, 4to. In this last work, he pretends to have discovered the Hebrew metre, which was supposed to be irretrievably lost. But his hypothesis, though defended by some, yet has been confuted by several learned men, particularly by Dr Lowth in his *Metrical Hareane brevis confutatio*, annexed to his lectures *De Sacra Poesi Hebraeorum*.

HARESBURY a town of Wiltshire, on the Willy, near Warminster, 94 miles from London, is in old records called *Heightsbury*, or *Heytsbury*; and now it is writ Hatchbury. It was once the seat of the empress Maud. Here are fairs May 14th, and September 15th; and it has sent members to parliament ever since Henry VI. it being an ancient borough by prescription. There is an almshouse here for 12 poor men and a woman. Here is a collegiate church with four prebendaries, and a free school, and the place is governed by a bailiff and burgeses.

HARFLEUR an ancient town of France, in Normandy; but is now a poor place, on account of its fortifications being demolished, and its harbour choaked up. It was taken by the English, by assault, in the year 1415. It is seated on the river Lizarda, near the Seine, five miles from Hayre de Grace, forty north-west of Rouen, and one hundred and six north-west of Paris. E. Long. 0. 17. N. Lat. 49. 30.

HARIOT, or **HERIOT**, in law, a due belonging to a lord at the death of his tenant, consisting of the best beast, either horse, or cow, or ox, which he had at the time of his death; and in some manors the best goods, piece of plate, &c. are called hariots.

HARIOT (Thomas), See HARRIOT.

HARLECH, a town of Merionethshire, in north Wales. It is seated on a rock, on the sea-shore; and is but a poor place, though the shire-town, and sends a member to parliament. It had formerly a strong handsome castle, which was a garrison for Charles I. in the civil wars, for which reason it was afterwards demolished by the parliament. W. Long. 4. 0. N. Lat. 54. 47.

HARLEIAN COLLECTION.—A most valuable collection.

Haresbury

Harleian.

Harleian,
Harlem.

collection of useful and curious manuscripts, begun near the end of the last century, by Robert Harley of Brampton Bryan, Esq; in Herefordshire, afterwards earl of Oxford and lord high-treasurer; and which was conducted upon the plan of the great Sir Robert Cotton. He published his first considerable collection in August 1705, and in less than ten years he got together near 2500 rare and curious MSS. Soon after this, the celebrated Dr George Hicks, Mr Anstis garter king at arms, bishop Nicolson, and many other eminent antiquaries, not only offered him their assistance in procuring MSS. but presented him with several that were very valuable. Being thus encouraged to perseverance by his success, he kept many persons employed in purchasing MSS. for him abroad, giving them written instructions for their conduct. By these means the MS. library was, in the year 1721, increased to near 6000 books, 14,000 original charters, and 500 rolls.

On the 21st of May 1724 lord Oxford died: but his son Edward, who succeeded to his honours and estate, still farther enlarged the collection; so that when he died, June 16th 1741, it consisted of 8000 volumes, several of them containing distinct and independent treatises, besides many loose papers which have been since sorted and bound up in volumes; and above 40,000 original rolls, charters, letters patent, grants, and other deeds and instruments of great antiquity.

The principal design of making this collection was the establishment of a MS. English historical library, and the rescuing from destruction such national records as had eluded the diligence of preceding collectors: but lord Oxford's plan was more extensive; for his collection abounds also with curious MSS. in every science.—This collection is now in the British Museum; and an enumeration of its contents may be seen in the Annual Register, vi. 140, &c.

HARLEM, a town of the United Provinces, in Holland, situated on the river Sparren, in E. Long. 5. 17. N. Lat. 53. 22. It is a large and populous city, and stands near a lake of the same name, with which it has a communication, as well as with Amsterdam and Leyden, by means of several canals. Schemes have been often formed for draining of this lake, but were never put in execution. To the south of the town lies a wood, cut into delightful walks and vistas. The town is famous for the siege which it held out against the Spaniards for ten months in 1573; the townsmen, before they capitulated, being reduced to eat the vilest animals, and even leather and grass. The inhabitants corresponded with the prince of Orange for a considerable time by means of carrier-pigeons. Harlem, as is well known, claims the invention of printing; and in fact, the first essays of the art are indisputably to be attributed to Laurentius, a magistrate of that city. [See LAURENTIUS, and (*History of*) PRINTING.] Before the Reformation, Harlem was a bishop's see; and the Papists still greatly outnumber the Protestants. An academy of sciences was founded here in 1752. Vast quantities of linen and thread are bleached here; the waters of the lake having a peculiar quality, which renders them very fit for that purpose.—A sort of phrensy with regard to flowers, particularly tulips, once prevailed here, in consequence of which the most beautiful sorts were bought and sold at an extravagant price.

Nº 148.

HARLEQUIN, in the Italian comedy, a buffoon, dressed in party-coloured cloaths; answering much the same purpose as a merry-andrew or jack-pudding in our drolls, on mountebanks stages, &c. We have also introduced the harlequin upon our theatres; and this is one of the standing characters in the modern grotesque or pantomime entertainments.—The term took its rise from a famous Italian comedian who came to Paris under Henry III. and who frequenting the house of M. de Harlay, his companions used to call him Harlequino, q. d. little Harlay; a name which has descended to all those of the same rank and profession.

HARLEY (Robert), earl of Oxford and Mortimer, was the eldest son of Sir Edward Harley, and born in 1661. At the Revolution, Sir Edward and his son raised a troop of horse at their own expence; and after the accession of king William and queen Mary, he obtained a seat in parliament. His promotions were rapid: in 1702, he was chosen speaker of the house of commons; in 1704, he was sworn of queen Anne's privy council, and the same year made secretary of state; in 1706, he acted as one of the commissioners for the treaty of Union; and in 1710, was appointed a commissioner of the treasury, and chancellor and under-treasurer of the exchequer. A daring attempt was made on his life, March 8. 1711, by the marquis of Guiscard a French papist; who, when under an examination before a committee of the privy council, stabbed him with a penknife. Of this wound, however, he soon recovered; and was the same year created earl of Oxford, and lord high-treasurer, which office he resigned just before the queen's death. He was impeached of high treason in 1715, and committed to the Tower; but was cleared by trial, and died in 1724. His character has been variously represented, but cannot be here discussed. He was not only an encourager of literature, but the greatest collector in his time of curious books and MSS. his collection of which makes a capital part of the British Museum. See HARLEIAN Collection.

HARLING. See HERLING.

HARLINGEN, a sea-port town of the United Netherlands, in West Friesland. It stands on the coast of the Zuyder sea, at the mouth of a large canal, in E. Long. 5. 25. N. Lat. 53. 12. It was only a hamlet till about the year 1234, when it was destroyed by the sea; and being afterwards rebuilt, became a considerable town. In 1579, it was considerably enlarged by the care of William prince of Orange. It is now very well fortified, and is naturally strong, as the adjacent country can very easily be laid under water. The city is square; and the streets are handsome, straight, and clean, with canals in the middle of them. It has five gates; four towards the land, and one towards the sea; but though the harbour is good, yet vessels of great burden cannot get into it until they are lightened, for want of water. The admiralty college of Friesland has its seat here. The manufactures are salt, bricks, and tiles; a considerable trade is also carried on in all sorts of linen cloth, and the adjacent country yields abundance of corn and good pastures.

HARLOCH, or HARLEICH, a town of Merionethshire, in North Wales, 223 miles from London, on the sea coast, near the north-west point of the county.

Harley
||
Harloch.

Harlot,
Harmat-
tan

It is naturally strong, a garrison being kept here for the security of the coast. Its castle lies now in ruins. The town, though a corporation and governed by a mayor, makes but a very mean appearance. It has a market on Saturdays, and four fairs in the year.

HARLOT, a woman given to incontinency, or that makes a habit or a trade of prostituting her body.—The word is supposed to be used for the diminutive *whorelet*, a “little whore.”—Others derive it from *Arletta*, mistress to Robert duke of Normandy, and mother to William the Conqueror: Camden derives it from one *Arlotha*, concubine to William the Conqueror: Others from the Italian *Arlotta*, “a proud whore.”

Harlots were tolerated amongst Jews, Greeks, and Romans. Fornication indeed was prohibited among the Jews, under severe penalties; but these they explained as extending only to women of their own nation. The public stews were therefore stocked with foreign prostitutes, who seem to have been taken under the protection of government. Hence appears the reason why the word *strange woman* is often found to signify a harlot. Prostitutes at first wore veils or masks; but by and by their modesty was entirely put to flight, and they went abroad bare-faced. At Athens the prostitutes were generally strangers; and such as debauched an Athenian female were liable to a penalty. To frequent the public stews was not held disgraceful! The wisest of the Heathen sages allowed it! Solon permitted common whores to go publicly to the young men who had engaged them, and encouraged the youth of Athens to gratify their lust with these, rather than seduce and debauch the wives or daughters of citizens. Cato the Censor was of the same sentiments; and Cicero challenges all persons to name a time when men were either reprov'd for this practice, or not countenanced in it. Amongst the Jews, the harlots used to ply in the highways and streets of cities; at Athens they frequented the ceramicus, sciros, and the old forum.—In some places they were distinguished by their dress from other women. Corinth was a remarkable nursery of harlots, and gave birth to the noted Lais. Their accomplishments were oftentimes great, in all the polite and elegant parts of female education, viz. philosophy, dancing, singing, rhetoric, &c. Aspasia, the mistress of Pericles, was admired by Socrates for her learning. The more accomplished prostitutes frequently amassed large fortunes; a remarkable instance of which we have in Phryne, who offered to rebuild the walls of Thebes, when destroyed by Alexander, on condition that they would perpetuate her memory and profession by an inscription. Prostitutes at Rome were obliged to fix a bill over their doors, indicating their character and profession. It was also customary for them to change their names, after they had signified to the prætor their intention of leading such a dissolute life: this they did, because their trade was unbecoming their birth and condition; but they re-assumed their family names when they quitted their infamous mode of living. Women whose grandfather, father, or husband, had been a Roman knight, were forbidden by the laws to make a public profession of lewdness.

HARMATTAN, the name of a remarkable periodical wind which blows from the interior parts of A-

VOL. VIII. Part I.

frica towards the Atlantic ocean. Of this wind we have the following account in the Philosophical Transactions, vol. 71. furnished by Mr Norris, a gentleman who had frequent opportunities of observing its singular properties and effects.

“On that part of the coast of Africa which lies between Cape Verd and Cape Lopez, an easterly wind prevails during the months of December, January, and February, which by the Fantees, a nation on the Gold coast, is called the *Harmattan*. Cape Verd is in 15 N. latitude, and Cape Lopez in 1 S. latitude; and the coast between these two Capes runs, in an oblique direction, nearly from W. S. W. to E. S. E. forming a range of upwards of 2100 miles. At the isles de Los, which are a little to the northward of Sierra Leone, and to the southward of Cape Verd, it blows from the E. S. E. on the Gold coast from the N. E. and at Cape Lopez, and the river Gabon, from the N. N. E. This wind is by the French and Portuguese, who frequent the Gold coast, called simply the N. E. wind, the quarter from which it blows. The English, who sometimes borrow words and phrases from the Fantee language, which is less guttural and more harmonious than that of their neighbours, adopt the Fantee word *Harmattan*.

The harmattan comes on indiscriminately at any hour of the day, at any time of the tide, or at any period of the moon, and continues sometimes only a day or two, sometimes five or six days, and it has been known to last fifteen or sixteen days. There are generally three or four returns of it every season. It blows with a moderate force, not quite so strong as the sea-breeze (which every day sets in during the fair season from the W. W. S. W. and S. W.); but somewhat stronger than the land wind at night from the N. and N. N. W.

1. A fog or haze is one of the peculiarities which always accompanies the harmattan. The gloom occasioned by this fog is so great, as sometimes to make even near objects obscure. The English fort at Whydah stands about the midway between the French and Portuguese forts, and not quite a quarter of a mile from either, yet very often from thence neither of the other forts can be discovered. The sun, concealed the greatest part of the day, appears only a few hours about noon, and then of a mild red, exciting no painful sensation on the eye.

2. Extreme dryness makes another extraordinary property of this wind. No dew falls during the continuance of the harmattan; nor is there the least appearance of moisture in the atmosphere. Vegetables of every kind are very much injured; all tender plants, and most of the productions of the garden, are destroyed; the grass withers, and becomes dry like hay; the vigorous ever-greens likewise feel its pernicious influence; the branches of the lemon, orange, and lime-trees droop, the leaves become flaccid, wither, and if the harmattan continues to blow for 10 or 12 days, are so parched, as to be easily rubbed to dust between the fingers: the fruit of these trees, deprived of its nourishment, and stunted in its growth, only appears to ripen, for it becomes yellow and dry, without acquiring half the usual size. The natives take this opportunity of the extreme dryness of the grass and young trees to set fire to them, especially near their

Harmat-
tan.

Harmat-
tan.

their roads, not only to keep those roads open to travellers, but to destroy the shelter which long grass, and thickets of young trees, would afford to skulking parties of their enemies. A fire thus lighted flies with such rapidity, as to endanger those who travel: in that situation, a common method of escape is, on discovering a fire to windward, to set the grass on fire to leeward, and then follow your own fire. There are other extraordinary effects produced by the extreme dryness of the harmattan.

The parching effects of this wind are likewise evident on the external parts of the body. The eyes, nostrils, lips, and palate, are rendered dry and uneasy, and drink is often required, not so much to quench thirst, as to remove a painful aridity in the fauces. The lips and nose become sore, and even chapped; and though the air be cool, yet there is a troublesome sensation of prickling heat on the skin. If the harmattan continues four or five days, the scarf skin peels off, first from the hands and face, and afterwards from the other parts of the body if it continues a day or two longer. Mr Norris observed, that when sweat was excited by exercise on those parts which were covered by his cloaths from the weather, it was peculiarly acrid, and tasted, on applying his tongue to his arm, something like spirits of hartshorn diluted with water.

3. Salubrity forms a third peculiarity of the harmattan. Though this wind is so very prejudicial to vegetable life, and occasions such disagreeable parching effects on the human species, yet it is highly conducive to health. Those labouring under fluxes and intermitting fevers generally recover in an harmattan. Those weakened by fevers, and sinking under evacuations for the cure of them, particularly bleeding, which is often injudiciously repeated, have their lives saved, and vigour restored, in spite of the doctor. It stops the progress of epidemics: the small-pox, remittent fevers, &c. not only disappear, but those labouring under these diseases when an harmattan comes on, are almost certain of a speedy recovery. Infection appears not then to be easily communicated even by art. In the year 1770, there were on board the *Unity*, at Whydah, above 300 slaves; the small-pox broke out among them, and it was determined to inoculate; those who were inoculated before the harmattan came on, got very well through the disease. About 70 were inoculated a day or two after the harmattan set in, but no one of them had either sickness or eruption. It was imagined that the infection was effectually dispersed, and the ship clear of the disorder; but in a very few weeks it began to appear among those seventy. About 50 of them were inoculated the second time; the others had the disease in a natural way: an harmattan came on, and they all recovered, excepting one girl, who had an ugly ulcer on the inoculated part, and died some time afterwards of a locked jaw."

This account differs remarkably from that given by Dr Lind, who calls the harmattan a malignant and fatal wind: (See his *Diseases of Hot Climates*.) As to the nature of the soil over which it blows, it appears, that excepting a few rivers and some lakes, the country about and beyond Whydah is covered for 400 miles back with verdure, open plains of grass, clumps of trees, and some woods of no considerable extent. The surface is sandy, and below that a rich reddish

earth: it rises with a gentle ascent for 150 miles from the sea, before there is the appearance of a hill, without affording a stone of the size of a walnut. Beyond these hills there is no account of any great ranges of mountains.

HARMODIUS, a friend of Aristogiton, who delivered his country from the tyranny of the Pisistratidæ. (See ARISTOGITON.) The Athenians, to reward the patriotism of these illustrious citizens, made a law that no one should ever after bear the name of Aristogiton and Harmodius.

HARMONIA, in fabulous history, the wife of Cadmus, both of whom were turned into serpents. See CADMUS.

Though many of the ancient authors make Harmonia a princess of divine origin, there is a passage in Athenæus from Euhemerus, the Vanini of his time, which tells us, that she was by profession a player on the flute, and in the service of the prince of Zidon previous to her departure with Cadmus. This circumstance, however, might encourage the belief, that as Cadmus brought letters into Greece, his wife brought harmony thither; as the word *αρμονια* *harmonia*, has been said to have no other derivation than from her name: which makes it very difficult to ascertain the sense in which the Greeks made use of it in their music†; for it has no roots by which it can be decom-
pounded, in order to deduce from them its etymology. The common account of the word, however, that is given by lexicographers, and generally adopted by the learned, does not confirm this opinion. It is generally derived from *αρμονω*, and this from the old verb *αρω* *apto*, to fit or join.

HARMONIC. As an adjective, it signifies in general any thing belonging to harmony; though in our language the adjective is more properly written *harmonical*. In this case it may be applied to the *harmonical* divisions of a monochord; or, in a word, to consonances in general. As a substantive neuter, it imports all the concomitant or accessory sounds which, upon the principles resulting from the experiments made on sonorous bodies, attend any given sound whatever, and render it appetitible. Thus all the aliquot parts of a musical string produce *harmonical* sounds, or *harmonics*.

HARMONICA. This word, when originally appropriated by Dr Franklin to that peculiar form or mode of musical glasses, which he himself, after a number of happy experiments, had constituted, was written *Armonica*. In this place, however, we have ventured to restore it to its native plenitude of sound, as we have no antipathy against the moderate use of aspirations. It is derived from the Greek word *αρμονια*. The radical word is *αριω*, to suit or fit one thing to another. By the word *αρμονια* the Greeks expressed aptitudes of various kinds; and from the use which they made of that expression, we have reason to conclude, that it was intended to import the highest degree of refinement and delicacy in those relations which it was meant to signify. Relations or aptitudes of sound, in particular, were understood by it; and in this view, Dr Franklin could not have selected a name more expressive of its nature and genius, for the instrument which we are now to describe; as, perhaps, no musical tone can possibly be finer, nor consequently susceptible

Harmodius
||

ca.† See Har-
mony.

Harmoni-
ca.

ceptible of juster concords, than those which it produces.

In an old English book, whose title we cannot at present recollect, and in which a number of various amusements were described, we remember to have seen the elements or first approaches to music by glasses. That author enjoins his pupil to choose half a dozen of such as are used in drinking; to fill each of them with water in proportion to the gravity or acuteness of the sound which he intended it should produce; and having thus adjusted them one to another, he might entertain the company with a church-tune. These, perhaps, were the rude and barbarous hints which Mr Puckeridge afterwards improved. But, for a farther account of him, of the state in which he left the instrument, and of the state to which it has afterwards been carried, we must refer our readers to the following extracts from Dr Franklin's letters, and from others who have written upon the same subject.

The Doctor, in his letter to Father Beccaria, has given a minute and elegant account of the Harmonica. Nor does it appear that his successors have either more sensibly improved, or more accurately delineated, that angelic instrument. The detail of his own improvements, therefore, shall be given in his own words.

"Perhaps (says he) it may be agreeable to you, as you live in a musical country, to have an account of the new instrument lately added here to the great number that charming science was possessed of before. As it is an instrument that seems peculiarly adapted to Italian music, especially that of the soft and plaintive kind, I will endeavour to give you such a description of it, and of the manner of constructing it, that you or any of your friends may be enabled to imitate it, if you incline so to do, without being at the expence and trouble of the many experiments I have made in endeavouring to bring it to its present perfection.

"You have doubtless heard the sweet tone that is drawn from a drinking-glass, by pressing a wet finger round its brim. One Mr Puckeridge, a gentleman from Ireland, was the first who thought of playing tunes formed of these tones. He collected a number of glasses of different sizes; fixed them near each other on a table; and tuned them, by putting into them water, more or less as each note required. The tones were brought out by pressing his fingers round their brims. He was unfortunately burnt here, with his instrument, in a fire which consumed the house he lived in. Mr E. Delaval, a most ingenious member of our Royal Society, made one in imitation of it with a better choice and form of glasses, which was the first I saw or heard. Being charmed with the sweetness of its tones, and the music he produced from it, I wished to see the glasses disposed in a more convenient form, and brought together in a narrower compass, so as to admit of a greater number of tones, and all within reach of hand to a person sitting before the instrument; which I accomplished, after various intermediate trials, and less commodious forms, both of glasses and construction, in the following manner.

"The glasses are blown as near as possible in the form of hemispheres, having each an open neck or socket in the middle. The thickness of the glass near the brim is about the tenth of an inch, or hardly quite so much, but thicker as it comes nearer the neck;

Harmoni-
ca.

which in the largest glasses is about an inch deep, and an inch and a half wide within; these dimensions lessening as the glasses themselves diminish in size, except that the neck of the smallest ought not to be shorter than half an inch.—The largest glass is nine inches diameter, and the smallest three inches. Between these there are 23 different sizes, differing from each other a quarter of an inch in diameter. To make a single instrument there should be at least six glasses blown of each size; and out of this number one may probably pick 37 glasses (which are sufficient for three octaves with all the semitones) that will be each either the note one wants, or a little sharper than that note, and all fitting so well into each other as to taper pretty regularly from the largest to the smallest. It is true there are not 37 sizes; but it often happens that two of the same size differ a note or half a note in tone, by reason of a difference in thickness, and these may be placed one in the other without sensibly hurting the regularity of the taper form.

"The glasses being chosen, and every one marked with a diamond the note you intend it for, they are to be tuned by diminishing the thickness of those that are too sharp. This is done by grinding them round from the neck towards the brim, the breadth of one or two inches as may be required; often trying the glass by a well-tuned harpsichord, comparing the note drawn from the glass by your finger with the note you want, as sounded by that string of the harpsichord. When you come near the matter, be careful to wipe the glass clean and dry before each trial, because the tone is something flatter when the glass is wet than it will be when dry;—and grinding a very little between each trial, you will thereby tune to great exactness. The more care is necessary in this, because if you go below your required tone there is no sharpening it again but by grinding somewhat off the brim—which will afterwards require polishing, and thus increase the trouble.

"The glasses being thus tuned, you are to be provided with a case for them, and a spindle on which they are to be fixed. My case is about three feet long, eleven inches every way wide within at the biggest end, and five inches at the smallest end; for it tapers all the way, to adapt it better to the conical figure of the set of glasses. This case opens in the middle of its height, and the upper part turns up by hinges fixed behind. The spindle is of hard iron, lies horizontally from end to end of the box within, exactly in the middle, and is made to turn on brass gudgeons at each end. It is round, an inch diameter at the thickest end, and tapering to a quarter of an inch at the smallest.—A square shank comes from its thickest end through the box, on which shank a wheel is fixed by a screw. This wheel serves as a fly to make the motion equable, when the spindle, with the glasses, is turned by the foot like a spinning-wheel. My wheel is of mahogany, 18 inches diameter, and pretty thick, so as to conceal near its circumference about 25 lb. of lead.—An ivory pin is fixed in the face of this wheel, about four inches from the axis. Over the neck of this pin is put the loop of the string that comes up from the moveable step to give it motion. The case stands on a neat frame with four legs.

"To fix the glasses on the spindle, a cork is first to be

Harmoni-
ca.

be fitted in each neck pretty tight, and projecting a little without the neck, that the neck of one may not touch the inside of another when put together, for that would make a jarring. These corks are to be perforated with holes of different diameters, so as to suit that part of the spindle on which they are to be fixed. When a glass is put on, by holding it stiffly between both hands, while another turns the spindle, it may be gradually brought to its place. But care must be taken that the hole be not too small, lest in forcing it up the neck should split; nor too large, lest the glass, not being firmly fixed, should turn or move on the spindle, so as to touch or jar against its neighbouring glass. The glasses thus are placed one in another; the largest on the biggest end of the spindle, which is to the left hand: the neck of this glass is towards the wheel; and the next goes into it in the same position, only about an inch of its brim appearing beyond the brim of the first; thus proceeding, every glass when fixed shows about an inch of its brim (or three quarters of an inch, or half an inch, as they grow smaller) beyond the brim of the glass that contains it; and it is from these exposed parts of each glass that the tone is drawn, by laying a finger on one of them as the spindle and glasses turn round.

"My largest glass is G a little below the reach of a common voice, and my highest G, including three complete octaves.—To distinguish the glasses more readily to the eye, I have painted the apparent parts of the glasses within-side, every semitone white, and the other notes of the octave with the seven prismatic colours; viz. C, red; D, orange; E, yellow; F, green, G, blue; A, indigo, B, purple; and C, red again;—so that the glasses of the same colour (the white excepted) are always octaves to each other.

"This instrument is played upon by sitting before the middle of the set of glasses, as before the keys of a harpsichord, turning them with the foot, and wetting them now and then with a sponge and clean water. The fingers should be first a little soaked in water, and quite free from all greasiness; a little fine chalk upon them is sometimes useful, to make them catch the glass and bring out the tone more readily. Both hands are used, by which means different parts are played together.—Observe, that the tones are best drawn out when the glasses turn *from* the ends of the fingers, not when they turn *to* them.

"The advantages of this instrument are, that its tones are incomparably sweet beyond those of any other; that they may be swelled and softened at pleasure by stronger or weaker pressures of the finger, and continued to any length; and that the instrument, being once well tuned, never again wants tuning."

Such was the state in which this learned and ingenious author found, and such the perfection to which he carried, that celestial instrument of which we now treat. We call it *celestial*; because, in comparison with any other instrument which we know, the sounds that it produces are indeed heavenly. Some of them, however, are still constructed in the same imperfect manner as the instrument of Mr Puckeridge. They are contained in an oblong chest; their positions are either exactly or nearly rectilinear; the artificial semitones by which the full notes are divided form another parallel line; but the distances between each of them are

much greater than those between the notes of the natural scale, as they take their places, not directly opposite to the notes which they are intended to heighten or depress, but in a situation between the highest and lowest, to show, that in ascending they are sharps to the one, and in descending flats to the other. This structure, however, is doubly inconvenient; for it not only increases the labour and difficulty of the performer, but renders some musical operations impracticable, which upon the *Harmonica*, as constituted by Dr Franklin, may be executed with ease and pleasure. In this fabric, if properly formed and accurately tuned, the instrument is equally adapted to harmony and melody. But as no material structure could ever yet be brought to the perfection even of human ideas, this instrument still in some measure retains the perverse nature of its original stamina. Hence it is not without the utmost difficulty that the glasses can be tuned by grinding; and the least conceivable redundancy or defect renders the discord upon this instrument more conspicuous and intolerable than upon any other. Hence likewise that inexpressible delicacy to be observed in the manner of the friction by which the sound is produced: for if the touch be too gentle, it cannot extort the tone; and if too strong, besides the mellow and delicate sound which ought to be heard, we likewise perceive the finger jarring upon the glass, which, mingled with those softer sounds by which the senses had been soothed, gives a feeling similar to iron grating upon iron, but more disagreeable. In wind-instruments the operation of the tongue, in harpsichords the stroke of the quill, and on the violin the motion of the bow, gives that strong and sensible interruption of sound which may be called *articulation*, and which renders the rhythmus or measure of an air more perceptible: but, upon the glasses, the touch of the finger is too soft to divide the notes with so much force; so that, unless the mind be steadily attentive, they seem to melt one into another, by which means the idea of rhythmus is almost lost. There is no way of performing a slur but by forbearing to stop the first sound, when that which is immediately subsequent commences. Thus, when the slur is of any length, and regularly descends or rises by the interval of a second, all the notes in the slur must be heard together, and produce no agreeable dissonance; yet if it rises or descends by perfect chords, the effect is pleasing. The open shake, or trill, is another unhappy operation upon musical glasses; which can only be performed by the alternate pulsations of two continued sounds, differing from each other only by a note or semitone. But as these pulsations thus managed cannot be distinct, the result is far from being pleasant; nor is there any succedaneum for the close shake, which in the violin is performed by alternately depressing the string to the finger-board, and suffering it to rise without entirely removing the finger from it, and which, by giving the note that tremulous sound produced by the human voice affected with grief, is a grace peculiarly adapted to pathetic and plaintive airs.

We proceed, however, to a farther account of the same instrument, extracted from the Annual Register, vol. iv. p. 149.

"Besides those tones (says the author of that account) which every elastic string produces by a vibration

Harmoni-
ca.

bration of all its parts, it is capable of another set of tones, in which only a part of the string is supposed to vibrate. These sounds are produced by the lightest touches, either by air, as in Oswald's lyre, or by rubbing the bow in the softest manner on the string of a fiddle.

"Analogous to these sounds are those produced by bells: in those last, besides those tones produced by their elliptical vibrations, there are a set of tones which may be brought by gently rubbing their edges, and in which the whole instrument does not appear to vibrate in all its parts as before.

"Take, for instance, a bell finely polished at the edges; or, what will perhaps be more convenient, a drinking-glass: let the edges be as free from any thing oily as possible; then, by moistening the finger in water (I have found alum-water to be best), and rubbing it circularly round the edge of the glass, you will at length bring out the tone referred to.

"This note is possessed of infinite sweetness; it has all the excellencies of the tone of a bell without its defects. It is loud, has a sufficient body, is capable of being swelled and continued at pleasure; and, besides, has naturally that vibratory softening which musicians endeavour to imitate by mixing with the note to be played a quarter-tone from below.

"To vary these tones, nothing more is required than to procure several bells or glasses of different tones, tuned as nearly as possible, which may be done by thinning the edges of either: or, for immediate satisfaction, the glasses may be tuned by pouring in water; the more water is poured in, the graver the tone will be.

"Let us suppose then a double octave of those glasses, thus tuned, to be procured. Any common tune may be executed by the fingers rubbing upon each glass successively; and this I have frequently done without the least difficulty, only choosing those tunes which are slow and easy. Here then are numbers of delicate tones, with which musicians have been till very lately unacquainted; and the only defect is, that they cannot be made to follow each other with that celerity and ease which is requisite for melody. In order to remedy this, I took a large drinking glass, and by means of a wheel and gut, as in the electrical machine, made it to turn upon its axis with a moderately quick but equable motion; then moistening the finger as before, nothing more was required than merely to touch the glass at the edge, without any other motion, in order to bring out the tone.

"Instead of one glass only turning in this manner, if the whole number of glasses were so fixed as to keep continually turning by means of a wheel, it follows, that upon every touch of the finger a note would be expressed; and thus, by touching several glasses at once, an harmony of notes might be produced, as in an harpsichord.

"As I write rather to excite than satisfy the curious, I shall not pretend to direct the various ways this number of glasses may be contrived to turn; it may be sufficient to say, that if the glasses are placed in the segment of a circle, and then a strap, as in a cutler's wheel, be supposed to go round them all, the whole number will by this means be made to turn by means of a wheel.

Harmoni-
ca.

"Instead of the finger, I have applied moistened leather to the edge of the glass, in order to bring out the tone: but, for want of a proper elasticity, this did not succeed. I tried cork, and this answered every purpose of the finger; but made the tone much louder than the finger could do. Instead, therefore, of the finger, if a number of corks were so contrived as to fall with a proper degree of pressure on the edge of the glass, by means of keys like the jacks of an organ, it is evident, that in such a case a new and tolerably perfect instrument would be produced; not so loud indeed as some, but infinitely more melodious than any.

"The mouths of the glasses or bells used in this experiment should not resemble the mouth of a trumpet, but should rather come forward with a perpendicular edge. The corks used in this case should be smooth, even free from those blemishes which are usually found in them, and at the same time the more elastic the better."

In the two accounts here given seems to be comprehended every thing valuable which has been said upon the subject. It remains, however, our permanent opinion, that the form and structure designed and constituted by Dr Franklin is by much the most eligible; nor can we admit, that a cork, however successfully applied, will produce the same mellowness and equality of tone in general with the finger. It appears to us, that, by this kind of voluntary attrition, a note may be sunk or swelled with much more art and propriety than by the substitution of any thing else extrinsic to the hand; and when chords are long protracted, that degree of friction, which renders every sound in the chord sensible to the ear, without harshness, must be the most agreeable. For this reason, likewise, we should recommend alum-water in preference to chalk.

From what has already been said, it will easily be perceived, that this instrument requires to be tuned with the nicest degree of delicacy which the laws of temperament will possibly admit. For these laws the reader will naturally have recourse to the article MUSIC †, in † Chap. viii. this Dictionary; where, from M. D'Alembert, is given a plain and satisfactory account, both of the method proposed by Rameau, and of that established in common practice, without anticipating the experience and taste of the reader, by dictating which of these plans is preferable. To those who have occasion to tune the instrument, it may likewise be useful to peruse the detached article TEMPERAMENT in this Work. Without recapitulating the different rules of alteration prescribed in these accounts, we shall presuppose the reader acquainted with them; and proceed to describe how, under their influence, the *Harmonica* may be tuned. But it is previously expedient to observe, that the same rules which conduct the process of tuning a harpsichord, will be equally effectual in tuning the *Harmonica*; with this only difference, that greater delicacy in adjusting the chords should, if practicable, be attempted.

There are different notes from whence the procedure of tuning may commence. *La* or *A*, which is the key that pretty nearly divides the harpsichord, is chosen by some; this *la* in common spinets is 24 natural keys from the bottom, and 13 from the top: and the *ut* above it, or second *C* upon the *G* cleff, by others. This last we should rather advise, because we imagine those intervals

Harmoni-
ca.

intervals which we have called *seconds major* to be more just through the whole octave, when the course of tuning is begun by a natural semitone. The initiate, therefore, may begin by tuning the second *ut* of his *Harmonica*, or C above the treble cleff, in unison with its correspondent C upon the harpsichord or any other instrument in concert-pitch; then, descending to its octave below, adjust it with the *ut* above, till every pulsation if possible be lost, and the sounds rendered scarcely distinguishable when simultaneously heard. To the lowest note of this octave he must tune the *sol* or G immediately above it by a fifth, still observing the laws of temperament: To this G, the *re*, or D immediately above it, by the same chord: To the *re*, or D above, its octave below: To this, by a fifth, the *la* or A immediately above it: To *la*, the *mi* or E ascending in the same proportion: To *mi*, its octave below: To this, the *fi* or B immediately above it by a fifth: To the first *ut*, or C, which was tuned, the *fa* or F immediately below by the same chord.

That the practitioner may be still more secure in the justice and propriety of his procedure, he may try the thirds of the notes already adjusted, and alter, as much as is consistent with the fifths and octaves, such among these thirds as may seem grating and disagreeable to his ear. Thus far having accomplished his operation, he may tune all the other natural notes whether above or below by octaves. His next concern is with the semitones. And here it will be suggested by common sense, that as in all instruments with fixed scales the sharp of a lower must likewise answer for the flat of a higher tone, the semitone ought as nearly as possible to divide the interval. He may begin with *la* or A sharp; which *la* in its natural state is a third minor beneath the *ut* or C, from whence he began in the natural scale. This semitone should correspond with the F natural immediately above by a fifth. To it may be tuned the *re* or D sharp immediately below by a similar chord: To D sharp, its octave above: To *fi* or B natural, immediately above the *la* or A first mentioned, may be adjusted the F or *fa* sharp immediately above it: To this its octave below: To that octave, the C or *ut* sharp above by a fifth: To the C sharp, its octave below: To this, by a fifth, the G or *sol* sharp above. Between this G sharp and the D sharp immediately above it, the fifth will probably be too sharp; but if the others are justly tuned, that discord will not be extremely offensive; and it is a necessary consequence of temperament. The rest of the sharps and flats, like their naturals, whether ascending or descending, may be tuned by their octaves.

The notes, with their chords, may be expressed by letters and figures, thus; where, however, it must be observed, that the higher notes of any chord are marked with larger capitals. It should likewise be remarked, that the figures are not expressive of the different ratios which the notes bear one to another, considered with respect to their vibrations; but only significant of their nominal distances, according to the received denominations of the intervals. $\overset{8}{C} \overset{5}{c} \overset{5}{G} \overset{8}{c} \overset{5}{D} \overset{8}{D} \overset{5}{D} \overset{5}{A}$
 $\overset{5}{A} \overset{5}{E} \overset{8}{E} \overset{5}{B} \overset{5}{C} \overset{5}{F}$. The sharps and flats thus, $\overset{5}{A} \overset{8}{\times} \overset{5}{F} \overset{5}{\sharp}$,
 $\overset{5}{A} \overset{8}{\times} \overset{5}{D} \overset{5}{\times}$, $\overset{5}{D} \overset{8}{\times} \overset{5}{D} \overset{5}{\times}$, $\overset{5}{B} \overset{8}{\sharp} \overset{5}{F} \overset{5}{\times}$, $\overset{5}{F} \overset{8}{\times} \overset{5}{F} \overset{5}{\times}$. $\overset{5}{F} \overset{8}{\times} \overset{5}{C} \overset{5}{\times}$, $\overset{5}{C} \overset{8}{\times} \overset{5}{C} \overset{5}{\times}$,
 $\overset{5}{c} \overset{8}{\times} \overset{5}{G} \overset{5}{\times}$. In running over the sharps and flats as the

naturals, it will likewise be necessary to try the thirds, and to alter such as may offend the ear; which, if cautiously done, will not sensibly injure the other chords. — Though this article has been protracted to a length which we did not originally intend, we have however the satisfaction to find, that it comprehends every thing essential; so that any person who understands the nature of chords, and the practical principles of music as universally taught, may not only be able to tune his instrument, but to acquire its whole manœuvre, without the least assistance from a master.

On Plate CCXXVI. is represented an instrument of this kind, made by Mr Dobb of St Paul's church-yard, London.

Though this topic appeared in itself complete in the former edition of this extensive work, yet having since received from Dr Edmund Cullen of Dublin the following observations, and reflecting that men of musical talents have not only different tastes, but different powers of mechanical operation, we have thought it proper to submit to the choice of our readers, either Dr Franklin's form and arrangement of the glasses, or that which has been adopted by Dr Cullen; but in either case, we would recommend it to the initiate in this instrument, to distinguish by colours, according to Dr Franklin, the notes and semitones. — We likewise cannot forbear to think, that the complete bass practicable on the harmonica, is by many degrees preferable to the chords with which Dr Cullen proposes to grace every emphatic note, with which, from the structure and arrangement of his instrument, he is under a necessity of deluding instead of satisfying the ear, with the full effect of the regular procedure of the treble and bass upon the same instrument.

This instrument the Doctor describes as consisting "of 35 glasses of different sizes, answering to so many distinct sounds, and ranged in the manner hereafter to be described. They are exactly of the form of a cocoa nut when the usual quantity of the top is cut off, or the sugar-bowls made of cocoa-nut shells so much in use will give a precise idea of their figure. They are blown with plain long stalks, which are fitted to wooden feet screwed on a board at proper distances, in such a manner that the circular tops of all may be in the same horizontal plane, at the distance of about an inch asunder. Of these 35, 10 only are allotted for half tones; there remain therefore 25 for the diatonic scale. The lowest note corresponds to G in the bass clef; hence it extends upward to the octave above C in alt. For uniformity, take the glasses which are chosen gradually and regularly diminishing in size as they ascend in tone. This, however, is not absolutely necessary, as the tone of the glass does not entirely depend upon its size, but in a great measure upon the proportion of its different parts to one another: hence the glass corresponding to one note may be smaller than a glass corresponding to a note three or four tones higher: however, where it is practicable, they should always be chosen gradually diminishing as they ascend, both on account of the elegance of appearance, and that an equality in point of loudness may be preserved; for, as every body knows, an instrument may be liable to great inequality in point of strength, though perfectly in tune. This must have a very bad effect; and therefore we find performers on the violin and other instruments of that kind very solicitous about the proportional

Harmoni-
ca.

Harmoni-
ca. tional thickness of their strings. The glasses being chosen in the best manner circumstances will permit, we proceed to arrange them. Here let me observe, that in general the diameter of the largest glass at its mouth is about seven inches, and its solid contents about five English pints, while the highest is of about $\frac{1}{4}$ inch, and its contents about $\frac{1}{2}$ of a gill: this, however, is arbitrary, and depends upon the pitch of the instrument. In arranging the glasses, we shall, to avoid confusion, take the diatonic scale first, and afterwards the half tones will be easily understood. The wooden feet before mentioned are to be screwed on a strong board of a proper size, and they are disposed at convenient intervals in rows perpendicular to the longest sides of the rectangular board on which they stand. In these feet the glasses are disposed in the following manner: Beginning with the lowest note G, we fix that on the foot which stands in the nearest angle of the board on the left hand, A in the next bottom in the same perpendicular line, B in the third: when we come to C, however, we do not place it in the same perpendicular line, but in the nearest bottom of the second perpendicular row to the left hand, D in the second of the same row, E in the third; F again in the nearest bottom of the third row, G in the second of the same row, A in the third; B again in the nearest bottom of the fourth row, C in the second of the same, and so on. By this contrivance, it is easy to see an immense compass is obtained: so great a one indeed, that if the glasses were disposed according to the old method, regularly ascending in a line parallel to the front of the instrument, to take in the same compass, it must stretch to a considerable length, no less than a length equal to the sum of all the perpendiculars we before spoke of, which in ordinary size of the glasses would amount to upwards of 16 feet; the inconvenience of which it is unnecessary to dwell upon. As to the half tones, perhaps a more judicious and convenient arrangement may be thought of for them: but the present mode is far from inconvenient, except in some keys; and it is sufficiently commodious for performing such airs as are best suited to the nature and design of the instrument. After explaining the arrangement, we shall speak somewhat more exactly of them. E $\flat$ on the first line of the treble stave stands in the fourth bottom of the first perpendicular row to the left hand; F $\sharp$ on the first space stands in the fourth place of the second row, G $\sharp$ on the second line of the treble stave stands in the fourth of the third row, C $\sharp$ on the third space of the same stave stands in the same manner in the fourth row, and so on, ascending F $\sharp$ in the fifth row, G $\sharp$ in the sixth, A $\sharp$ in the seventh, C $\sharp$ in the eighth. In the ninth perpendicular row, that is, the last to the right hand in the diatonic scale, stands C alone; but immediately behind is placed B $\flat$ of the middle line of the treble stave, and again behind it D $\flat$ of the fourth line of the treble stave, which finishes the whole. There is something singular, and perhaps whimsical, in the distribution of the half tones: but it is found sufficiently convenient; and if a better is thought of, it may easily be adopted. In the mean time I must observe, that two of them, viz. C $\sharp$ and F $\sharp$, standing immediately behind the D and G respectively above them, are singularly well fitted for performing running passages either up or down in the key of G. *Ex. gr.* let us suppose that we have that very common A, G, F $\sharp$, E, semiquavers. Here the performer touches A, which is in the first place of the 6th row, with his left hand, G with the fore-finger of his right, F $\sharp$ with the middle, and E again with the left hand; in the same manner may E, D, C $\sharp$, and B, be played, or upwards by inverting the motion: Thus we can with the utmost ease run either up or down two very frequent passages in a key, which might naturally be supposed difficult upon this instrument, and that with any given rapidity. I wish as much could be said of all the other half tones, of which, by the bye, some are altogether wanting: it is obvious, however, that they may easily be added, if we can find convenient places; and I apprehend even that very practicable. Be that as it may, notwithstanding the seemingly inconvenient situation of some half tones, and the total want of others, pieces may be performed on this instrument of considerable rapidity. I myself, though very far from being an accomplished player, can with great ease go through all the parts of Fisher's celebrated Rondeau; nay, I have heard the fifth concerto of Vivaldi played upon it with as much distinctness as upon a violin. The glasses are not necessarily chosen perfectly in tune, but are tuned by the help of a quantity of water. Here, however, two cautions are necessary: 1st, By no means to take a glass which is, when without water, flatter than the note you intend; as in that case you cannot remedy it, the water making the tone still flatter: rather let it be somewhat sharper, and you may tune it to the utmost nicety by a little water. The second caution is, not to choose a glass which is very much sharper than the note required; as in that case, so large a quantity of water will be required to tune it as will entirely smother the tone.

" This instrument is to be played somewhat in the manner of the harmonica, viz. the fingers are to be well wetted; and by the application of them to the side, assisted by a proper motion, the sound is produced. And here I would observe, that the proper motion is, to make the fingers follow the thumb, not the thumb follow the fingers in going round the glass: it is necessary also to preserve the circular motion very exactly, as the least deviation from it produces the most horrible sound that can be conceived. It is likewise to be observed, that you must touch the smaller glasses upon the very top of the brim; and for that purpose the palm of the hand must be nearly parallel to the top of the glass: but in coming to the larger glasses, it is absolutely necessary to make the fingers touch the side, not the top of the glass; and the larger the glass, the more distant from the top must they be touched. Practice alone can determine this matter.

" From this disposition of the glasses, it is easy to see that the perfect chord of C is always most completely in our power, namely, by using different fingers to the different notes at the same time: and although a full bass cannot be executed upon this instrument, we have always a great number of accompaniments which can easily be introduced; more perhaps than upon any instrument, the organ and others of that species excepted. The thirds or fifths occasionally can be introduced; and when done with taste and judgment, will scarcely yield to a middling bass. If to this is added the thrilling softness of the tones, inimitable by any other substance, it will readily appear to be an instrument more in the true style of

Harmoni-
ca.

Harmoni-
ca.

of music, of that music which the heart acknowledges, than any that either chance or ingenuity has hitherto produced. It is indeed incapable of that whimsical subdivision to which the taste of modern composers, that sworn enemy to harmony and real music, leads; which serves no end but to exhibit the wonderful executions of a favourite performer, and to overwhelm his hearers with stupid admiration. This is not music; and upon these occasions, though I acknowledge the difficulty of doing what I see done, I lament that the honest man has taken so much pains to so little purpose. Our instrument is not capable of this (at least not in so exquisite a degree as the harpsichord, violin, and a few others); yet if the true and original intent of music is not to astonish but to please, if that instrument which most readily and pleasingly seizes the heart thro' the ears is the best, I have not a moment's hesitation in setting it down the first of all musical instruments. There is but one which will in any degree bear the comparison, or rather they are the same instrument, I mean Dr Franklin's harmonica: but I am inclined to think that the instrument we have been speaking of has some superiority over the harmonica. The first striking difference is in the impracticability of executing quick passages on the latter; whereas it is in most cases extremely easy on the other. Again, the very long continued vibration of the glass, inevitably must produce horrible discord, or at least confusion, except the piece played be so slow that the vibration of one glass be nearly over before the other is heard. Now, in our instrument, this may be remedied by laying pieces of sponge lightly between the glasses, so as to allow them only the proper extent of vibration. This, however, is an exceptionable method: and it is much better done by the touch of the performer's finger, which instantly stops the vibration; and the use of this may be learned by a very little practice, the motion here being entirely voluntary: But in the harmonica, the motion being partly mechanical, e.g. the rotation of the glasses, this cannot be done; and for the same reason, in the execution of the crescendo the harmonica is not so perfect as this instrument. Besides, the inconvenience of tuning the half tones, as sharps or flats, separately, is as great in the harmonica as in the harpsichord. This is a very great imperfection; as half tones, being tuned at the medium, are false both as sharps and as flats. The learned Dr Smith says, there is no less than one-fifth of the interval difference between the sharp of one note and the flat of the next above; and for this purpose proposes to have an harpsichord constructed with a stop, so as to direct the jacks to the sharps or flats according to the prevalence of either in the piece to be played: but in our instrument, from its very construction, this inconvenience is avoided. As to matters of convenience, the harmonica is exceedingly apt to be out of order; the glasses frequently break, plainly on account of the great strain upon them where they join the spindle, and are thus with much difficulty renewed; whereas with us the loss of a glass is nothing. Add to all this, that the harmonica, in point of original expence, is about five times as high as the other: although I apprehend it possesses no one advantage, except that the performer may sit at it; whereas with our instrument it is convenient, if not necessary, to stand; but he must be a lazy musician that gives himself much concern

about that: And if he will sit at our instrument, he may, though at the expence of much ease in point of execution.

"Let us now consider some objections that have been made to this instrument. One is, that necessity of standing, in order to do any thing capital upon it. But is not that the case in all instruments, except where the performer sits of necessity? Did ever any one see Giardini or Fisher play a solo sitting? But for the satisfaction of these torpid gentlemen, I can faithfully assure them, I knew a lady who performed on this instrument perfectly well, though she had lost the use of both her legs. A more serious and important objection lies both to this and the harmonica, viz. the want of a shake. How this is supplied upon the harmonica, I cannot say, as I never saw it even attempted: but on our instrument, although a very perfect shake can scarcely be produced, something so like it may be done as will fairly excuse the want; and that is, by whirling the two stands round the note concerned with the shake with the utmost velocity, beginning the lower note a little sooner than the other. By this means, except in very large glasses where the vibrations are too distant in time, such an intermixture of the two sounds is produced, as extremely well imitates a fine shake, and the dexterous performer will make the beat in a turned shake with a spare finger. This operation requires some dexterity; but this is a charge common to all musical instruments; and I question not but that the Highland bagpipe itself requires some sort of skill.

"Upon the whole, I am clearly of opinion, that the harmonica, and more especially this instrument which has as yet got no name, is the most exquisite and noble present that the lovers of true harmony have ever yet received; and it is with much astonishment I find this invaluable treasure almost entirely confined to Ireland, a country not very remarkable for musical taste or talents: But I hope soon to see this elegant species of music very generally known and practised over all Europe."

HARMONY. The sense which the Greeks gave to this word in their music, is so much less easy to be determined, because, the word itself being originally a substantive proper, it has no radical words by which we might analyse it, to discover its etymology. In the ancient treatises which remain to us, *harmony* appears to be that department whose object is the agreeable succession of sounds, merely considered as high or low; in opposition to the two others called *rhythmica* and *metrica*, which have their principle in time and measure. This leaves our ideas concerning that aptitude of sound vague and undetermined; nor can we fix them without studying for that purpose all the rules of the art; and even after we have done so, it will be very difficult to distinguish harmony from melody, unless we add to the last the ideas of rhythmus and measure; without which, in reality, no melody can have a distinguishing character: whereas harmony is characterised by its own nature, independent of all other quantities except the chords or intervals which compose it.

It appears by a passage of Nicomachus, and by others, that they likewise gave the name of *harmony* to the chord of an octave, and to concerts of voices and instruments, which performed in the distance of an oc-

Harmoni-
ca,
Harmony.

Harmony. gave one from the other, and which is more commonly called *antiphone*.

Harmony, according to the moderns, is a succession of chords agreeable to the laws of modulation. For a long time this harmony had no other principle but such rules as were almost arbitrary, or solely founded on the approbation of a practised ear, which decided concerning the agreeable or disagreeable succession of chords, and whose determinations were at last reduced to calculation. But father Merfenne and M. Saveur having found that every sound, however simple in appearance, was always accompanied with other sounds less sensible, which constitute with itself a perfect chord-major; with this experiment M. Rameau set out, and upon it formed the basis of his harmonic system, which he has extended to a great many volumes, and which at last M. D'Alembert has taken the trouble of explaining to the public.

Signior Tartini, taking his route from an experiment which is newer and more delicate, yet not less certain, has reached conclusions similar enough to those of Rameau, by pursuing a path whose direction seems quite opposite. According to M. Rameau, the treble is generated by the bass; Signior Tartini makes the bass result from the treble. One deduces harmony from melody, and the other supposes quite the contrary. To determine from which of the two schools the best performances are likely to proceed, no more is necessary than to investigate the end of the composer, and discover whether the air is made for the accompaniments, or the accompaniments for the air. At the word *SYSTEM* in Rousseau's Musical Dictionary, is given a delineation of that published by Signior Tartini. Here he continues to speak of M. Rameau, whom he has followed through this whole work, as the artist of greatest authority in the country where he writes.

He thinks himself obliged, however, to declare, That this system, however ingenious it may be, is far from being founded upon nature; an affirmation which he incessantly repeats: "That it is only established upon analogies and congruities, which a man of invention may overturn to-morrow, by substituting others more natural: that, in short, of the experiments from whence he deduces it, one is detected fallacious, and the other will not yield him the consequences which he would extort from it. In reality, when this author took it in his head to dignify with the title of *demonstration* the reasonings upon which he established his theory, every one turned the arrogant pretence into ridicule. The Academy of Sciences loudly disapproved a title so ill founded, and so gratuitously assumed; and M. Estive, of the Royal Society at Montpellier, has shown him, that even to begin with this proposition, That according to the law of nature, sounds are represented by their octaves, and that the octaves may be substituted for them, there was not any one thing demonstrated, or even firmly established, in his pretended demonstration." He returns to his system.

"The mechanical principle of resonance presents us with nothing but independent and solitary chords; it neither prescribes nor establishes their succession. Yet a regular succession is necessary; a dictionary of selected words is not an oration, nor a collection of legitimate chords a piece of music: there must be a

VOL. VIII. Part I.

meaning, there must be connections in music as well as in language: it is necessary that what has preceded should transmit something of its nature to what is subsequent, so that all the parts conjoined may form a whole, and be stamped with the genuine character of unity.

"Now, the complex sensation which results from a perfect chord must be resolved into the simple sensation of each particular sound which composes it, and into the sensation of each particular interval which forms it, ascertained by comparison one with another. Beyond this there is nothing sensible in any chord; from whence it follows, that it is only by the relation between sounds, and by the analogy between intervals, that the connection now in question can be established; and this is the genuine, the only source, from whence flow all the laws of harmony and modulation. If, then, the whole of harmony were only formed by a succession of perfect chords-major, it would be sufficient to proceed by intervals similar to those which compose such a chord; for then some one or more sounds of the preceding chord being necessarily protracted in that which is subsequent, all the chords would be found sufficiently connected, and the harmony would, at least in this sense, be one.

"But besides that these successions must exclude all melody by excluding the diatonic series which forms its foundation, it would not arrive at the real end of the art; because, as music is a system of meanings like a discourse, it ought, like a discourse, to have its periods, its phrases, its suspenses, its cadences, its punctuation of every kind; and because the uniformity of a harmonical procedure implies nothing of all this, diatonic procedures require that major and minor chords should be intermixed; and the necessity of dissonances has been felt in order to distinguish the phrases, and render the cadences sensible. Now, a connected series of perfect chords-major can neither be productive of perfect chords-minor nor of dissonances, nor can sensibly mark any musical phrase, and the punctuation must there be found entirely defective.

"M. Rameau being absolutely determined, in his system, to deduce from nature all the harmony practised among us, had recourse, for this effect, to another experiment of his own invention, of which I have formerly spoken, and which by a different arrangement is taken from the first. He pretended, that any simple sound whatever afforded in it multiplies a perfect minor or flat chord, of which it was the dominant or fifth, as it furnished a perfect chord-major by the vibration of its aliquot parts, of which it is the tonic or fundamental sound. He has affirmed as a certain fact, that a vocal string caused two others lower than itself to vibrate through their whole extent, yet without making them produce any sound, one to its twelfth major and the other to its seventeenth; and from this joined to the former fact, he has very ingeniously deduced, not only the application of the minor mode and of dissonances in harmony, but the rules of harmonic phrases and of all modulation, such as they are found at the words *Chord, Accompaniment, Fundamental Bass, Cadence, Dissonance, Modulation*.

"But first (continues Rousseau), the experiment is false. It is discovered, that the strings tuned beneath the fundamental sound do not entirely vibrate

R r

when

Harmony. when this fundamental sound is given; but that they are divided in such a manner as to return its unison alone, which of consequence can have no harmonics below. It is moreover discovered, that the property of strings in dividing themselves, is not peculiar to those which are tuned by a twelfth and seventeenth below the principal sound; but that oscillations are likewise produced in the lower strings by all its multiples. Whence it follows, that, the intervals of the twelfth and seventeenth below not being singular phenomena of their kind, nothing can be concluded in favour of the perfect minor chord which they represent.

“ Though the truth of this experiment were granted, even this would by no means remove the difficulty. If, as M. Rameau alleges, all harmony is derived from the resonance of sonorous bodies, it cannot then be derived only from the vibrations of such bodies as do not resound. In reality, it is an extraordinary theory, to deduce from bodies that do not resound the principles of harmony; and it is a position in natural philosophy no less strange, that a sonorous body should vibrate without resounding, as if sound itself were any thing else but the air impelled by these vibrations. Moreover, sonorous bodies do not only produce, besides the principal sound, the other tones which with itself compose a perfect chord; but an infinite number of other sounds, formed by all the aliquot parts of the bodies in vibration, which do not enter into that perfect harmony. Why then should the former sounds produce consonances, and why should the latter not produce them, since all of them equally result from nature?

“ Every sound exhibits a chord truly perfect, since it is composed of all its harmonics, and since it is by them that it becomes a sound. Yet these harmonics are not heard, and nothing is distinguished but a simple sound, unless it be exceedingly strong: whence it follows, that the only good harmony is an unison; and that, as soon as the consonances can be distinguished, the natural proportion being altered, the harmony has lost its purity.

“ That alteration is in this case produced two different ways. First, by causing certain harmonics to resound, and not the others, the proportion of force which ought to prevail in all of them is altered, for producing the sensation of a single sound; whence the unity of nature is destroyed. By doubling these harmonics, an effect is exhibited similar to that which would be produced by suppressing all the others; for in that case we cannot doubt, but that, along with the generating sound, the tones of the other harmonics which were permitted to sound would be heard: whereas, in leaving all of them to their natural operations, they destroy one another, and conspire together in forming and strengthening the simple sensation of the principal sound. It is the same effect which the full sound of a stop in the organ produces, when, by successively removing the stopper or register, the third and fifth are permitted to sound with the principal; for then that fifth and third, which remained absorbed in the other sounds, are separately and disagreeably distinguished by the ear.

“ Moreover, the harmonics which we cause to sound have other harmonics pertaining to themselves, which cannot be such to the fundamental sound. It is by

these additional harmonics that the sounds which produce them are distinguished with a more sensible degree of harshness; and these very harmonics which thus render the chord perceptible, do not enter into its harmony. This is the reason why the most perfect chords are naturally displeasing to ears whose relish for harmony is not sufficiently formed; and I have no hesitation in thinking, that even the octave itself might be displeasing, if the mixture of male and female voices did not inure us to that interval from our infancy.

“ With dissonance it is still worse; because, not only the harmonics of the sound by which the discord is produced, but even the sound itself, is excluded from the natural harmony of the fundamental: which is the cause why discord is always distinguished amongst all the other sounds in a manner shocking to the sense.

“ Every key of an organ, with the stop fully opened, gives a perfect chord with its third major, which are not distinguished from the fundamental sound, if the hearer is not extremely attentive, and if he does not sound the whole stop in succession; but these harmonic sounds are never absorbed in the fundamental, but on account of the prodigious noise, and by such a situation of the registers as may cause the pipes which produce the fundamental sound to conceal by their force the other sounds which produce these harmonics. Now, no person observes, nor can observe, this continual proportion in a concert; since, by the manner of inverting the harmony, its greatest force must in every instant be transferred from one part to another; which is not practicable, and would destroy the whole melody.

“ When we play upon the organ, every key in the bass causes to resound the perfect chord major; but because that bass is not always fundamental, and because the music is often modulated in a perfect minor chord, this perfect chord-major is rarely struck with the right hand; so that we hear the third minor with the major, the fifth with the triton, the seventh redundant with the octave, and a thousand other cacophonies, which, however, do not much disgust our ears, because habit renders them tractable; but it is not to be imagined that an ear naturally just would prove so patient of discords, when first exposed to the test of this harmony.

“ M. Rameau pretends, that trebles composed with a certain degree of simplicity naturally suggest their own basses; and that any man having a just, though unpractised ear, would spontaneously sing that bass. This is the prejudice of a musician, refuted by universal experience. Not only would he, who has never heard either bass or harmony, be of himself incapable of finding either the bass or the harmony of M. Rameau, but they would be displeasing to him if he heard them, and he would greatly prefer the simple unison.

“ When we consider, that, of all the people upon earth, who have all of them some kind of music and melody, the Europeans are the only people who have a harmony consisting of chords, and who are pleased with this mixture of sounds; when we consider that the world has endured for so many ages, whilst, of all the nations which cultivated the fine arts, not one has found out this harmony: that not one animal, not one bird, not one being in nature, produces any other chord but

Harmony. but the unison, nor any other music but melody: that the eastern languages, so sonorous, so musical; that the ears of the Greeks, so delicate, so sensible, practised and cultivated with so much art, have never conducted this people, luxurious and enamoured of pleasure as they were, towards this harmony which we imagined so natural: that without it their music produced such astonishing effects; that with it ours is so impotent: that, in short, it was reserved for the people of the north, whose gross and callous organs of sensation are more affected with the noise and clamour of voices, than with the sweetness of accents and the melody of inflections, to make this grand discovery, and to vend it as the essential principle upon which all the rules of the art were founded; when, in short, attention is paid to all these observations, it is very difficult not to suspect that all our harmony is nothing but a Gothic and barbarous invention, which would never have entered into our minds, had we been truly sensible to the genuine beauties of art, and of that music which is unquestionably natural.

"M. Rameau asserts, however, that harmony is the source of the most powerful charms in music. But this notion is contradictory both to reason and to matter of fact. To fact it is contradictory; because, since the invention of counter-point, all the wonderful effects of music have ceased, and it has lost its whole force and energy. To which may be added, that such beauties as purely result from harmony are only perceived by the learned; that they affect none with transport but such as are deeply conversant in the art: whereas the real beauties of music, resulting from nature, ought to be, and certainly are, equally obvious to the adept and the novice. To reason it is contradictory; since harmony affords us no principle of imitation by which music, in forming images and expressing sentiments, can rise above its native excellence till it becomes in some measure dramatic or imitative, which is the highest pitch of elevation and energy to which the art can aspire; since all the pleasures which we can receive from the mere mechanical influence of sounds are extremely limited, and have very little power over the human heart."

Thus far we have heard M. Rousseau, in his observations on harmony, with patience; and we readily grant, that the *system of harmony* by M. Rameau is neither demonstrated, nor capable of demonstration. But it will not follow, that any man of invention can so easily and so quickly subvert those aptitudes and analogies on which the system is founded. Every hypothesis is admitted to possess a degree of probability proportioned to the number of phenomena for which it offers a satisfactory solution. The first experiment of M. Rameau is, that every sonorous body, together with its principal sound and its octave, gives likewise its twelfth and seventeenth major above; which being approximated as much as possible, even to the chords immediately represented by them, return to the third, fifth, and octave, or, in other words, produce perfect harmony. This is what nature, when solicited, spontaneously gives; this is what the human ear, unprepared and uncultivated, imbibes with ineffable avidity and pleasure. Could any thing which claims a right to our attention, and acceptance from nature, be impressed with more genuine or more legible signatures of

her sanction than this? We do not contend for the truth of M. Rameau's second experiment. Nor is it necessary we should. The first, expanded and carried into all its consequences, resolves the phenomena of harmony in a manner sufficient to establish its authenticity and influence. The difficulties for which it affords no solution are too few and too trivial either to merit the regard of an artist, or a philosopher, as M. D'Alembert in his *elements* has clearly shown. The facts with which M. Rousseau confronts this principle, the armies of multiplied harmonics generated in *infinitum*, which he draws up in formidable array against it, only show the thin partitions which sometimes may divide philosophy from whim. For, as bodies are infinitely divisible, according to the philosophy now established, or as, according to every philosophy, they must be indefinitely divisible, each infinitesimal of any given mass, which are only harmonics to other principal sounds, must have fundamental tones and harmonics peculiar to themselves; so that, if the reasoning of Rousseau has any force against M. Rameau's experiment, the ear must be continually distracted with a chaos of inappreciable harmonics, and melody itself must be lost in the confusion. But the truth of the matter is, that, by the wise institution of nature, there is such a conformity established between our senses and their proper objects, as must prevent all these disagreeable effects. Rousseau and his opponent are agreed in this, that the harmonics conspire to form one predominant sound; and are not to be detected but by the nicest organs, applied with the deepest attention. It is equally obvious, that, in an artificial harmony, by a proper management of this wise precaution of nature, dissonances themselves may be either entirely concealed or considerably softened. So that, since by nature sonorous bodies in actual vibration are predisposed to exhibit perfect harmony; and since the human ear is, by the same wise regulation, fabricated in such a manner as to perceive it; the harmonical chaos of M. Rousseau may be left to operate on his own brain, where it will probably meet with the warmest reception it can expect to find*. Nor does it avail him to pretend, that before the harmonics can be distinguished, sonorous bodies must be impelled with a force which alters the chords, and destroys the purity of the harmony; for this position is equally false both in theory and practice. In theory, because an impulse, however forcible, must proportionally operate on all the parts of any sonorous body, so far as it extends: in practice, because the human ear actually perceives the harmony to be pure. What effects his various manœuvres upon the organ may have, we leave to such as have leisure and curiosity enough to try the experiments: but it is apprehended, that when tried, their results will leave the system of Rameau, particularly as remodelled by D'Alembert, in its full force.

Of all the whims and paradoxes maintained by this philosopher, none is more extravagant than his assertion, that every chord, except the simple unison, is displeasing to the human ear: nay, that we are only reconciled to octaves themselves by being inured to hear them from our infancy. Strange, that nature should have fixed this invariable proportion between male and female voices, whilst at the same time she inspired the hearers with such violent prepossessions against

Harmony. gainst it as were invincible but by long and confirmed habit! The translator of *D'Alembert's Elements*, as given under the article *MUSIC* in this Dictionary, has been at peculiar pains to investigate his earliest recollections upon this subject; and has had such opportunities, both of attending to his original perceptions, and of recognising the fidelity of his memory, as are not common. He can remember, even from a period of early childhood, to have been pleased with the simplest kinds of artificial harmony; to have distinguished the harmonics of sonorous bodies with delight; and to have been struck with horror at the sound of such bodies as, by their structure, or by the cohesion of their parts, exhibited these harmonics false. This is the chief, if not the only cause, of the tremendous and disagreeable sensation which we feel from the sound of the Chinese ghong. The same horrible cacophony is frequently, in some degree, produced by a drum unequally braced: from this sound the translator often remembers to have started and screamed, when carried through the streets of the town in which he was born in the arms of his nursery-maid; and as he is conscious, that the acoustic organs of many are as exquisite as his own, he cannot doubt but they may have had the same sensations, though perhaps they do not recollect the facts. So early and so nicely may the sensations of harmony and discord be distinguished. But after all, it seems that harmony is no more than a modern invention, and even at this late period only known to the Europeans. We should, however, be glad to know, from what oracle our philosopher learned that harmony was not known to antiquity. From what remains of their works, no proof of his position can be derived; and we have at least mentioned one probability against it in our notes to the Preliminary Discourse to the article *MUSIC*, (see Note B.) But tho' Rousseau's mighty objections were granted, that harmony can only be endured by such ears as are habitually formed and cultivated; that the period of its prevalence has been short, and the extent of its empire limited to Europe; still his conclusion, that it is a Gothic and barbarous invention, is not fairly deducible even from these premises. Must we affirm, that epic poetry has no foundation in nature, because, during the long interval which happened from the beginning of the world to the destruction of Troy, no epic poem seems to have appeared? Or because a natural and mellifluous versification is less relished by an unpolished taste, than the uncouth rhymes of a common ballad, shall we infer, that the power of numbers is merely supposititious and arbitrary? On the contrary, we will venture to affirm, that though harmony cannot, as Rameau supposes, be mathematically demonstrated from the nature and vibrations of sonorous bodies; yet the idea of its constituent parts, and of their coalescence, is no less established, no less precise and definite, than any mode or property of space or quantity to be investigated by geometrical researches or algebraical calculations. It is certain, that the mimetic or imitative power of music chiefly consists in melody; but from this truth, however evident, it cannot be fairly deduced, that harmony is absolutely unsusceptible of imitation. Perhaps every musical sound, even to the most simple, and all modulations of sound, are more or

less remotely connected with some sentiment or passion of the human heart. We know, that there are instinctive expressions of pain or pleasure in their various modes and degrees, which, when uttered by any sensitive, and perceived by any conscious being, excite in the mind of the percipient a feeling sympathetic with that by which they are prompted. We likewise know from experience, that all artificial sounds modulated in the same manner, have similar, though not equal, effects. We have seen, that, in order to render harmony compatible with itself, the melody of each part must be congenial; and, for that reason, one kindred melody result from the whole. So far, therefore, as any composer has it in his power to render the general melody homogeneous; so far the imitation may be preserved, and even heightened: for such objects as are majestic and august, or the feelings which they excite, are more aptly expressed by a composition of kindred sounds, than by any simple tone whatever. They who suppose the mimetic powers of music to be consummated in the imitation of mere unmeaning sounds or degrees of motion, must entertain limited and unworthy ideas of its province. It is naturally a representative almost of every sentiment or affection of the soul; and, when this end is gained, the art must have reached its highest perfection, and produced its noblest effects. But these effects, however sensible among the ancients, may in us be superseded by other causes which remain yet unexplored. Theatrical performances are likewise, by them, said to have produced the most wonderful effects; yet these we do not recognise amongst ourselves, though we have dramatic entertainments perhaps not inferior to theirs.

Rousseau proceeds to tell us, that among the ancients the *enharmonic* species of music was sometimes called *harmony*.

Direct HARMONY, is that in which the bass is fundamental, and in which the upper parts preserve among themselves, and with that fundamental bass, the natural and original order which ought to subsist in each of the chords that compose this harmony.

Inverted HARMONY, is that in which the fundamental or generating sound is placed in some of the upper parts, and when some other sound of the chord is transferred to the bass beneath the others.

HARMONY of the Spheres, or Celestial Harmony, a sort of music much talked of by many of the ancient philosophers and fathers, supposed to be produced by the sweetly tuned motions of the stars and planets. This harmony they attributed to the various proportionate impressions of the heavenly globes upon one another, acting at proper intervals. It is impossible, according to them, that such prodigious large bodies, moving with so much rapidity, should be silent: on the contrary, the atmosphere, continually impelled by them, must yield a set of sounds proportionate to the impression it receives; consequently, as they do not all run the same circuit, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony or concert.

They therefore supposed, that the moon, as being the lowest of the planets, corresponded to *mi*; Mercury, to *fa*; Venus, to *sol*; the Sun, to *la*; Mars, to *si*.

Harmostes *fi*; Jupiter, to *ut*; Saturn, to *re*; and the orb of the fixed stars, as being the highest of all, to *mi*, or the octave.

Haro.

HARMOSTES, or **HARMOSTA**, in antiquity, a sort of magistrate among the Spartans, whereof there were several, whose business was to look to the building of citadels, and repairing the forts and fortifications of the cities.—The word is *αρμοστής*, formed of *αρμω*, *apto*, *concino*, “I adapt, concert,” &c.

HARMOSYNIANS, *αρμοσύναι*, in antiquity, were magistrates among the Spartans, who, after the death of Lycurgus, were appointed to enforce the observance of that law of the Spartan legislator which required married women to wear a veil when they appeared in the streets, whereby they were distinguished from single females, who were allowed to appear abroad with their faces uncovered.

HARNESS, a complete armour, or the whole equipage and accoutrements of a cavalier heavily armed; as casque, cuirass, &c. The word is formed of the French *harnois*; which some derive from the Greek *αρναις*, “a lamb’s skin,” because they anciently covered themselves therewith. Du Cange observes, that the word *harnesum* is used in the corrupt Latin in the same sense, and that it comes from the High Dutch *harnas* or *harnisch*. Others derive it from the Italian *arnese*; others from the Celtic *harnes*, “a cuirass.”

Under king Richard II. it was expressly forbidden all men to ride in harness with launcegays. *Vide stat.* 7 Ric. II. cap. 13. In the statute 2 Hen. VI. cap. 14. harness seems to include all kinds of furniture for offence as well as defence, both of men and horse; as swords, buckles for belts, girdles, &c.

HARNESS is also used for the furniture put on a horse to draw in a coach or waggon, or other carriage; such as collars, leathers, traces, &c.

HARO, **HAROU**, or **Harol**, in the Norman customs.—*Glamour de haro* is a cry or formula of invoking the assistance of justice against the violence of some offender, who upon hearing the word *haro* is obliged to desist, on pain of being severely punished for his outrage, and to go with the party before the judge.

The word is commonly derived of *ha* and *roul*, as being supposed an invocation of the sovereign power, to assist the weak against the strong, on occasion of Raoul first duke of Normandy, about the year 912, who rendered himself venerable to his subjects by the severity of his justice; so that they called on him even after his death when they suffered any oppression. Some derive it from Harola king of Denmark, who in the year 826 was made grand conservator of justice at Mentz. Others from the Danish *aa rau*, q. d. “help me;” a cry raised by the Normans in flying from a king of Denmark named Roux, who made himself duke of Normandy. The letters of the French chancery have usually this clause, *Non obstant clameur de haro*, &c.

The haro had anciently such vast power, that a poor man of the city of Caen named Affelin, in virtue hereof, arrested the corps of William the Conqueror, in the middle of the funeral procession, till such time as his son Henry had paid the value of the land in question, which was that whereon the chapel was built wherein he was interred.

HAROLD, the name of two English kings. See *Harold, Harp.*

HARP, a musical instrument of the stringed kind, of a triangular figure, and held upright between the legs of the performer.

Papias, and Du Cange after him, will have the harp to have taken its name from the Arpi, a people of Italy, who were supposed the first that invented it; and from whom, they say, it was borrowed by other nations. Menage, &c. derive the word from the Latin *harpa*, and that from the German *herp* or *harp*. Others bring it from the Latin *carpo*, because touched or thrummed with the fingers. Dr Hickes derives it from *harpa* or *bearpa*, which signify the same thing; the first in the language of the Cimbri, the second in that of the Anglo-Saxons. The English priest who wrote the life of St Dunstan, and who lived with him in the tenth century, says, cap. ii. n. 12. *Sumpsit secum ex more citharam suam, quam paterna lingua hearpam vocamus*; which intimates the word to be Anglo-Saxon.

The harp was the favourite musical instrument of the Britons and other northern nations in the middle ages; as is evident from their laws, and from every passage in their history, in which there is the least allusion to music. By the laws of Wales, a harp was one of the three things that were necessary to constitute a gentleman, *i. e.* a freeman; and none could pretend to that character who had not one of these favourite instruments, or could not play upon it. By the same laws, to prevent slaves from pretending to be gentlemen, it was expressly forbidden to teach, or to permit, them to play upon the harp; and none but the king, the king’s musicians, and gentlemen, were allowed to have harps in their possession. A gentleman’s harp was not liable to be seized for debt; because the want of it would have degraded him from his rank, and reduced him to a slave. The harp was in no less estimation and universal use among the Saxons and Danes. Those who played upon this instrument were declared gentlemen by law; their persons were esteemed inviolable, and secured from injuries by very severe penalties; they were readily admitted into the highest company, and treated with distinguished marks of respect wherever they appeared.

There is some diversity in the structure of harps. That called the *triple harp* has 97 strings or chords in three rows, extending from C in the tenor cliff to double G in alt, which make five octaves: the middle row is for the semitones, and the two outside rows are perfect unisons. On the bass side, which is played with the right hand, there are 36 strings; on the treble side, 26; and in the middle row, 35 strings. There are two rows of pins or screws on the right side, serving to keep the strings tight in their holes, which are fastened at the other end to three rows of pins on the upper side. The harp, within the last 40 years, has been in some degree improved by the addition of eight strings to the unison, *viz.* from E to double F in alt. This instrument is struck with the finger and thumb of both hands. Its music is much like that of the spinet, all its strings going from semitone to semitone; whence some call it an *inverted spinet*. It is capable of a much greater degree of perfection than the lute.

There are among us two sorts of this instrument, *viz.*

Harp.

viz. the *Welsh harp*, being that just described; and the *Irish harp*. Plate CCXXVI. n° 1. represents the harp of Brian Boiromh, king of all Ireland, slain in battle with the Danes A. D. 1014, at Clontarf. His son Donagh having murdered his brother Teige, A. D. 1023, and being deposed by his nephew, retired to Rome, and carried with him the crown, harp, and other regalia of his father, which he presented to the Pope in order to obtain absolution. Adrian IV. surnamed Breakspear, alleged this circumstance as one of the principal titles he claimed to this kingdom in his bull transferring it to Henry II. These regalia were kept in the Vatican till the pope sent the harp to Henry VIII. with the title of Defender of the Faith; but kept the crown, which was of massive gold. Henry gave the harp to the first earl of Clanricard; in whose family it remained till the beginning of this century, when it came by a lady of the De Burgh family into that of Mac Mahon of Clenagh in the county of Clare, after whose death it passed into the possession of commissioner Mac Namara of Limerick. In 1782 it was presented to the right honourable William Conyngham, who deposited it in Trinity college library. It is 32 inches high, and of extraordinary good workmanship; the sounding-board is of oak, the arms of red sally; the extremity of the uppermost arm in part is cap't with silver, extremely well wrought and chiselled. It contains a large crystal set in silver, and under it was another stone now lost. The buttons or ornamental knobs at the sides of this arm are of silver. On the front arm are the arms chased in silver of the O'Brien family, the bloody hand supported by lions. On the sides of the front arm within two circles are two Irish wolf dogs cut in the wood. The holes of the sounding-board where the strings entered are neatly ornamented with escutcheons of brass carved and gilt; the larger sounding-holes have been ornamented, probably with silver, as they have been the object of theft. This harp has 28 keys, and as many string-holes, consequently there were as many strings. The foot-piece or rest is broken off, and the parts round which it was joined are very rotten. The whole bears evidence of an expert artist.

King David is usually painted with a harp in his hands; but we have no testimony in all antiquity that the Hebrew harp, which they call *chinnor*, was any thing like ours. On a Hebrew medal of Simon Maccabæus we see two sorts of musical instruments; but they are both of them very different from our harp, and only consist of three or four strings. All authors agree, that our harp is very different from the lyra, cithara, or barbiton, used among the Romans. Fortunatus, lib. vii. carm. 8. witnesses, that it was an instrument of the barbarians:

*Romanusque lyra, plaudat tibi barbarus harpa,
Græcus Achilliæba, crotta Britannia canat.*

Of ancient harps, two are represented on the same plate.—N° 2. is a *trigonum* or triangular harp. It is taken from an ancient painting in the museum of the king of Naples, in which it is placed on the shoulder of a little dancing Cupid, who supports the instrument with his left hand and plays upon it with his right. The *trigonum* is mentioned by Athenæus, lib. iv. and by Julius Pollux, lib. iv. cap. 9. According to Athenæus, Sophocles calls it a *Phrygian instrument*; and one of his

dipnosophists tells us, that a certain musician, named *Alexander Alexandrinus*, was such an admirable performer upon it, and had given such proofs of his abilities at Rome, that he made the inhabitants *μυσομαχίαν*, “musically mad.” N° 3. and 4. are varieties of the same instrument. N° 5. is the Theban harp, according to a drawing made from an ancient painting in one of the sepulchral grottos of the first kings of Thebes, and communicated by Mr Bruce to Dr Burney*. The performer is clad in a habit made like a shirt, such as * *Vide Burney's Hist. of Music*, p. 224. the women still wear in Abyssinia, and the men in Nubia. It reaches down to his ancles; his feet are without sandals, and bare; his neck and arms are also bare; his loose white sleeves are gathered above his elbows; and his head is close shaved. His left hand seems employed in the upper part of the instrument among the notes in *alto*, as if in an arpeggio; while, stooping forwards, he seems with his right hand to be beginning with the lowest string, and promising to ascend with the most rapid execution: this action, so obviously rendered by an indifferent artist, shows that it was a common one in his time; or, in other words, that great hands were then frequent, and consequently that music was well understood and diligently followed.

On this instrument Dr Burney makes the following observations: “The number of strings, the size and form of this instrument, and the elegance of its ornaments, awaken reflections, which to indulge would lead us too far from our purpose, and indeed out of our depth. The mind is wholly lost in the immense antiquity of the painting in which it is represented. Indeed the time when it was executed is so remote, as to encourage a belief, that arts, after having been brought to great perfection, were again lost and again invented long after this period.—With respect to the number of strings upon this harp, if conjectures may be allowed concerning the method of tuning them, two might be offered to the reader's choice. The first idea that presented itself at the sight of 13 strings was, that they would furnish all the semitones to be found in modern instruments within the compass of an octave, as from C to c, D to d, or E to e. The second idea is more Grecian, and conformable to antiquity; which is, that if the longest string represented *proslambanomenos*, or D, the remaining 12 strings would supply all the tones, semitones, and quarter-tones, of the diatonic, chromatic, and enharmonic genera of the ancients, within the compass of an octave: but for my part, I would rather incline to the first arrangement, as it is more natural, and more conformable to the structure of our organs, than the second. For with respect to the genera of the Greeks, though no historic testimony can be produced concerning the invention of the diatonic and chromatic, yet ancient writers are unanimous in ascribing to Olympus the Phrygian the first use of the enharmonic: and though in the beginning the melody of this genus was so simple and natural as to resemble the wild notes and rude essays of a people not quite emerged from barbarism; yet in after-times it became overcharged with finical fopperies and fanciful beauties, arising from such minute divisions of the scale as had no other merit than the great difficulty of forming them. It seems a matter of great wonder, with such a model before their eyes as the Theban harp, that the form and manner of using

Harp.
||
Harpies.

using such an instrument should not have been perpetuated by posterity; but that, many ages after, another of an inferior kind, with fewer strings, should take place of it. Yet if we consider how little we are acquainted with the use and even construction of the instruments which afforded the greatest delight to the Greeks and Romans, or even with others in common use in a neighbouring part of Europe only a few centuries ago, our wonder will cease; especially if we reflect upon the ignorance and barbarism into which it is possible for an ingenious people to be plunged by the tyranny and devastation of a powerful and cruel invader."

Bell-HARP, a musical instrument of the string kind, thus called from the common players on it swinging it about, as a bell on its basis.

It is about three feet long; its strings, which are of no determinate number, are of brass or steel wire, fixed at one end, and stretched across the sound-board by screws fixed at the other. It takes in four octaves, according to the number of the strings, which are struck only with the thumbs, the right hand playing the treble and the left hand the base: and in order to draw the sound the clearer, the thumbs are armed with a little wire pin. This may perhaps be the lyra, or cythara of the ancients; but we find no mention made of it under the name it now bears, which must be allowed to be modern.

HARP of Æolus. See ACOUSTICS, no 10.

HARPAGINES, in antiquity, were hooks of iron, hanging on the top of a pole, which, being secured with chains to the masts of ships, and then let down with great velocity into the enemy's vessels, caught them up into the air. By way of defence against these machines, they covered their ships with hides, which broke and blunted the force of the iron. The harpagines, by the Greeks called *Ἀρπαγίς*, owe their invention to Anacharsis the Scythian philosopher.

HARPAGIUS. See ARPAGIUS.

HARPALUS, a Greek astronomer, who flourished about 480 B. C. corrected the cycle of eight years invented by Cleostratus; and proposed a new one of nine years, in which he imagined the sun and moon returned to the same point. But Harpalus's cycle was afterwards altered by Meton, who added ten full years to it. See CHRONOLOGY, no 27.

HARPIES (*Ἀρπυιαι*, *HARPYIÆ*), in antiquity, a rapacious impure sort of monsters of the bird kind, mentioned among the poets. They are represented* with wings, ears like bears, bodies like vulturs, faces like women, and feet and hands hooked like the talons of birds of prey.

The ancients looked on the harpies as a sort of genii or demons. Some make them the daughters of Tellus and Oceanus, the *earth* and *ocean*; whence, says Servius, it is, that they inhabit an island, half on land and half in water. Valerius Flaccus makes them the daughters of Typhon.

There were three harpies, Aello, Ocypete, and Cæloeno, which last Homer calls *Podarge*. Hesiod, in his Theogony, ver. 267. only reckons two, Aello and Ocypete, and makes them the daughters of Thaumas and Electra, affirming that they had wings, and went with the rapidity of the wind. Zephyrus begat of them

Balius and Xanthus, Achilles's horses. Pherecydes relates, that the Boreades expelled them from the Ægean and Sicilian seas, and pursued them as far as the islands which he calls *Plectæ* and Homer *Calynæ*; and which have since been called the *Strophades*.

Vossius, De Idolol. lib. iii. cap. 99. p. 63. thinks, that what the ancients have related of the harpies, agrees to no other birds so well as the bats found in the territories of Darien in South America. These animals kill not only birds, but dogs and cats, and prove very troublesome to men by their peckings. But the ancients, as the same Vossius observes, knew nothing of these birds. By the harpies, therefore, he thinks, they could mean nothing else but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the scholiasts of Apollonius, Hesiod, and Eustathius. Their names, Aello, Ocypete, Cæloeno, are supposed to suggest a farther argument of this.

Mr Bryant supposes that the harpies were a college of priests in Bithynia, who on account of their repeated acts of violence and cruelty, were driven out of the country: their temple was called *Arpi*, and the environs *Arpiai*, whence the Grecians formed *Ἀρπυιαι*; and he observes farther, that *Harpya*, *Ἀρπυία*, was certainly of old the name of a place.

HARPING IRON. See HARPOON.

HARPINGS, the fore parts of the wales which encompass the bow of a ship, and are fastened to the stem, being thicker than the after part of the wales, in order to reinforce the ship in this place, where she sustains the greatest shock of resistance in plunging into the sea, or dividing it, under a great pressure of sail.

HARPOCRATES, in mythology, the son of Isis and Osiris. This is an Egyptian deity, whose distinguishing attribute is, that he is represented with his fingers applied to his mouth, denoting that he is the god of silence. The statue of this idol was fixed in the entrance of most of the Egyptian temples, and he was commonly exhibited under the figure of a young man naked, crowned with an Egyptian mitre, holding in one hand a cornucopia, and in the other the flower of lotus, and sometimes bearing a quiver.

HARPOCRATION (Valerius), a celebrated ancient rhetorician of Alexandria, who has left us an excellent *Lexicon upon the ten orators of Greece*. Aldus first published this lexicon in the Greek at Venice in 1603. Many learned men have laboured upon it; but the best edition was given by James Gronovius at Leyden in 1696.

HARPOON, or HARPING-IRON, a spear or javelin used to strike the whales in the Greenland fishery.

The harpoon, which is sometimes called the *harping-iron*, is furnished with a long staff, having at one end a broad and flat triangular head, sharpened at both edges, so as to penetrate the whale with facility: to the head of this weapon is fastened a long cord, called the *whale line*, which lies carefully coiled in the boat, in such a manner as to run out without being interrupted or entangled. See *Whale-FISHERY*.

GUN-HARPOON, a kind of fire-arm for discharging harpoons at whales, and thereby killing them more easily and expeditiously than formerly when the har-

Harping

Harpoon.

Virg. Æn.
iii.

Harpoon

||

Harrier.

poons were thrown by the hand. Though this method was projected a good many years ago, it has but lately come into use; and premiums have been annually offered by the society for encouraging arts, &c. to the persons who first struck a fish in this manner. In the Transactions of that society for 1786, we have an account of the first fish struck in this manner in 1784. The gun was of the blunderbuss construction, loaded with four common tobacco-pipes full of glazed powder; the fish was shot at the distance of ten fathoms, the harpoon going into her back up to the ring; and she was killed in about an hour. In 1785 three whales were killed in this manner; four in 1786, and three in 1787. Since that time the gun-harpoon has come more into use, and will probably soon supersede the other method entirely. In the Transactions of the Society for 1789, we have accounts of a number of whales killed in this manner. The instrument appears to be extremely useful in calm still weather, as the whale, though a timorous creature, will frequently allow a boat to approach it to the distance of 20, 15, or even 10 fathoms, all of which distances are within reach of the gun-harpoon, though not within the reach of that thrown by the hand. The greatest inconvenience was in case of rain or snow, by which the lock was apt to get wet. To remedy this, a case of leather was made to fit round the gun and over the lock, lined with tin, and big enough to fire the gun when it was on. The fish struck with an harpoon discharged in this manner are soon killed by reason of its penetrating their bodies to a great depth, not less than five or six feet, which no man's strength would be able to accomplish. In the volume just quoted, we have an account of one which was shot through the tail. The harpoon broke in the slit, but five fathoms of line went through the tail. The fish was killed in eight hours, which is perhaps the only instance of a fish struck in that part being caught. In another, the harpoon carried six feet of line into its body; the creature died in ten minutes. Others were killed in 15 minutes or half an hour, and one had a rib broken by the violence of the stroke. In the Transactions of the Society for 1790, there are other accounts similar to the foregoing, and all agreeing as to the great usefulness of the instrument both for striking the fish at a considerable distance, and for killing them in a very short time.

HARPSICHORD, the most harmonious of all the musical instruments of the string-kind. It is played on after the manner of the organ, and is furnished with a set, and sometimes with two sets of keys; the touching or striking of these keys moves a kind of little jacks, which also move a double row of chords or strings, of brass or iron, stretched over four bridges on the table of the instrument.

HARQUEBUSS, a piece of fire-arms, of the length of a musket, usually cocked with a wheel. It carried a ball that weighed one ounce seven-eighths.

There was also a larger sort, called the great harquebuss, used for the defence of strong places, which carried a ball of about three ounces and a half: but they are now but little used, except in some old castles, and by the French in some of their garrisons.

HARRIER, a kind of hound, endowed with an

N^o 149.

admirable gift of smelling, and very bold in the pursuit of his game. See **CANIS**.

HARRINGTON (Sir John), an ingenious English poet, was the son of John Harrington, Esq; who was committed to the Tower by queen Mary for holding a correspondence with her sister Elizabeth; who, when she came to the crown, stood godmother to this son. Before he was 30, he published a translation of Ariosto's Orlando Furioso, a work by which he was principally known; for though he afterwards published some epigrams, his talent did not seem to have lain that way. He was created knight of the bath by James I.; and presented a MS. to prince Henry, levelled chiefly at the married bishops. He is supposed to have died about the latter end of James's reign.

HARRINGTON (James), a most eminent English writer in the 17th century, bred at Oxford, travelled into Holland, France, Denmark, and Germany, and learned the languages of those countries. Upon his return to England, he was admitted one of the privy-chamber extraordinary to king Charles I. He served the king with great fidelity, and made use of his interest with his friends in parliament to procure matters to be accommodated with all parties. The king loved his company except when the conversation happened to turn upon commonwealths. He found means to see the king at St James's; and attended him on the scaffold, where, or a little before, he received a token of his majesty's affection. After the death of king Charles, he wrote his *Oceana*: a kind of political romance, in imitation of Plato's Commonwealth, which he dedicated to Oliver Cromwell. It is said, that when Oliver perused it, he declared, that "the gentleman had wrote very well, but must not think to cheat him out of his power and authority; for that what he had won by the sword, he would not suffer himself to be scribbled out of." This work was attacked by several writers, against whom he defended it. Beside his writings to promote republican principles, he instituted likewise a nightly meeting of several ingenious men in the New Palace-Yard, Westminster; which club was called the *Rota*, and continued till the secluded members of parliament were restored by general Monk. In 1661, he was committed to the Tower for treasonable designs and practices; and chancellor Hyde, at a conference with the lords and commons, charged him with being concerned in a plot. But a committee of lords and commons could make nothing of that plot. He was conveyed to St Nicolas's island, and from thence to Plymouth, where he fell into an uncommon disorder of the imagination. Having obtained his liberty by means of the earl of Bath, he was carried to London, and died in 1677. He published, besides the above works, several others, which were first collected by Toland, in one volume folio, in 1700; but a more complete edition was published, in 1737, by the reverend Dr Birch.

HARRIOT (Thomas), a celebrated algebraist, was born at Oxford in 1560, where he was also educated. In 1579, he completed his bachelor's degree; and, being already distinguished for his mathematical learning, was soon after recommended to Sir Walter Raleigh,

Harrington,
Harriot.

Harris. Raleigh, as a proper person to instruct him in that science. He was accordingly received into the family of that gentleman; who, in 1585, sent him with the colony, under Sir Richard Grenville, to Virginia; of which country, having remained there about a year, he afterwards published a topographical description. About the year 1588, Mr Harriot was introduced by his patron Sir Walter Raleigh, to Henry Percy earl of Northumberland, who allowed him a pension of 120*l. per annum*. He spent many years of his life in Sion college; where he died in July 1621, of a cancer in his lip, and was buried in the church of St Christopher, where a handsome monument was erected to his memory. Anthony Wood tells us, he was a deist, and that the divines looked upon his death as a judgment. Be his religious opinions what they might, he was doubtless one of the first mathematicians of the age in which he lived, and will always be remembered as the inventor of the present improved method of algebraical calculation. His improvements in algebra were adopted by Des Cartes, and for a considerable time imposed upon the French nation as his own invention; but the theft was at last detected, and exposed by Dr Wallis, in his History of Algebra, where the reader will find our author's invention accurately specified. His works are, 1. A brief and true report of the new-found land of Virginia; of the commodities there found, and to be raised, &c. 2. *Artis analyticae praxis ad aequationes algebraicas nova expedita, et generali methodo resolvendas, e posthumis Thomae Harrioti, &c.* 3. *Ephemeris chyrometrica*. Manuscript, in the library of Sion college. He is said to have left several other manuscripts which are probably lost.

HARRIS (William), a protestant dissenting minister of eminent abilities and character, resided at Honiton in Devonshire. Sept. 20. 1765, the degree of D. D. was conferred on him by the university of Glasgow, by the unanimous consent of the members of that body. "He published an Historical and Critical Account of the Lives of James I. Charles I. and Oliver Cromwell, in five vols 8vo. after the manner of Mr Bayle. He was preparing a like account of James II. He also wrote the life of Hugh Peters; besides many fugitive pieces occasionally, for the public prints, in support of liberty and virtue. All his works have been well received; and those who differ from him in principle, still value him in point of industry and faithfulness." We give this character in the words of his munificent patron Mr Hollis, who had presented him with many valuable books relative to the subjects of his histories; and was at the expence of procuring his degree. But the Doctor's works were differently thought of by the authors of the Critical Review (March 1766). "Industry was their principal characteristic. They certainly have none of the vivacity which inspired Bayle; and in the judgment of dispassionate readers, impartiality is frequently violated." Dr Harris died at Honiton, Feb. 4. 1770.

HARRIS (James, Esq;), an English gentleman of very uncommon parts and learning, was the son of James Harris, Esq; by a sister of lord Shaftesbury author of The Characteristics. He was born in the Close at Salisbury 1709; and educated at the grammar-school there. In 1726, he was removed to Wad-

ham-college in Oxford, but took no degree. He cultivated letters, however, most attentively; and also music, in the theory and practice of which he is said to have had few equals. He was member for Christchurch Hants, which he represented in several successive parliaments. In 1763, he was appointed one of the lords commissioners of the admiralty, and soon after removed to the board of treasury. In 1774 he was made secretary and comptroller to the queen, which post he held until his death. He died Dec. 21. 1780, in his 72d year, after a long illness, which he bore with calmness and resignation.—He is the author of some valuable works. 1. Three Treatises: concerning Art; Music, Painting, and Poetry; and Happiness, 1745, 8vo. 2. Hermes; or, A Philosophical Enquiry concerning Universal Grammar. 3. Philosophical Arrangements. 4. Philological Inquiries, 1782, 2 vols 8vo. finished just before his death, and published since. These Inquiries show much ingenuity and learning; but being the amusement of his old age rather than an exertion of genius, they have not the philosophic tone of his former productions.

HARRIS, one of the Hebrides or Western Islands of Scotland. It is 20 miles in length, and 10 in breadth. Upon the east side it is mostly rock; but on the west there are some tolerable farms, and the number of people amounts to 2000. It has Lewis on the north, and North Uist on the south, from which it is separated by a channel of four miles in width, called the Sound of Harris. This channel is navigable for vessels of burden, but it requires a skilful pilot. It is the only passage between the Butt of the Lewis and Bara for vessels of burden passing to and from the west side of the Long Island. The sound is greatly encumbered with rocks and islands, some of which are considerable, as Bernera, Pabay, Ensay, Killegray. These, with Scalpay, Taransay, and Scarp, compose the inhabited islands on the coast of Harris. Some of them produce good crops of grain, and all of them good pasture. Harris and its islands sell from 400 to 500 ton of kelp annually; it abounds on the east side in excellent lochs or bays, and its shores on both sides form one continued fishery. The fish on this coast, and along the whole shores of the Long Island, are more numerous, and of larger dimensions, than those on the opposite continent; on which account, two royal fishing stations were begun in the reign of Charles I. one in Loch Maddie, and the other in the Sound of Harris.

HARRISON (William), a writer much esteemed and patronised by the literati of his time, was fellow of New-college, Oxford, and had no other income than 40*l.* a year as tutor to one of the duke of Queensberry's sons. In this employment he fortunately attracted the favour of Dr Swift, whose solicitations with Mr St John obtained for him the reputable employment of secretary to lord Raby, ambassador at the Hague, and afterwards earl of Strafford. A letter of his whilst at Utrecht, dated Dec. 16. 1712, is printed in the Dean's works. Mr Harrison, who did not long enjoy his rising fortune, was dispatched to London with the Barrier-treaty; and died Feb. 14. 1712-13. See the Journal to Stella, of that and the following day; where Dr Swift laments his loss with the most unaffected sincerity. Mr Tickel has mentioned him with

Harris,
Harrison.

Harrison. respect in his Prospect of Peace; in English Poets, Vol. XXVI. p. 113; and Dr Young in the beautiful close of an Epistle to Lord Lansdowne, Vol. LII. p. 185, most pathetically bewails his loss. Dr Birch, who has given a curious note on Mr Harrison's Letter to Swift, has confounded him with Thomas Harrison, M. A. of Queen's-college. In Nichols's Select Collection are some pleasing specimens of his poetry; which, with Woodstock-Park in Dodley's Collection, and an Ode to the Duke of Marlborough, 1707, in Duncombe's Horace, are all the poetical writings that are known of this excellent young man; who figured both as an humourist and a politician in the fifth volume of the Tatler, of which (under the patronage of Bolingbroke, Henley, and Swift) he was professedly the editor. See the Supplement to Swift.—There was another William Harrison, author of The Pilgrim, or the happy Convert, a Pastoral Tragedy, 1709.

HARRISON (John), a most accurate mechanic, the celebrated inventor of the famous *time-keeper* for ascertaining the longitude at sea, and also of the compound, or, as it is commonly called, the *gridiron pendulum*; was born at Foulby, in the parish of Wragby, near Pontefract in Yorkshire, in 1693. The vigour of his natural abilities, if not even strengthened by the want of education, which confined his attention to few objects, at least amply compensated the deficiencies of it; as fully appeared from the astonishing progress he made in that branch of mechanics to which he devoted himself. His father was a carpenter, in which profession the son assisted; occasionally also, according to the miscellaneous practice of country artists, surveying land, and repairing clocks and watches. He was, from his early childhood, attached to any machinery moving by wheels, as appeared while he lay sick of the small-pox about the sixth year of his age, when he had a watch placed open upon his pillow to amuse himself by contemplating the movement. In 1700, he removed with his father to Barrow in Lincolnshire; where, though his opportunities of acquiring knowledge were very few, he eagerly improved every incident from which he might collect information; frequently employing all or great part of his nights in writing or drawing: and he always acknowledged his obligations to a clergyman who came every Sunday to officiate in the neighbourhood, who lent him a MS. copy of professor Saunderson's Lectures; which he carefully and neatly transcribed, with all the diagrams. His native genius exerted itself superior to these solitary disadvantages; for in the year 1726, he had constructed two clocks, mostly of wood, in which he applied the escapement and compound pendulum of his own invention: these surpassed every thing then made, scarcely erring a second in a month. In 1728, he came up to London with the drawings of a machine for determining the longitude at sea, in expectation of being enabled to execute one by the board of longitude. Upon application to Dr Halley, he referred him to Mr George Graham; who, discovering he had uncommon merit, advised him to make his machine before he applied to the board of longitude. He returned home to perform this task; and in 1735 came to London again with his first machine; with which he was sent to

Lisbon the next year for a trial of its properties. In Harrison. this short voyage, he corrected the dead reckoning about a degree and a half; a success that proved the means of his receiving both public and private encouragement. About the year 1739, he completed his second machine, of a construction much more simple than the former, and which answered much better: this, though not sent to sea, recommended Mr Harrison yet stronger to the patronage of his private friends and of the public. His third machine, which he produced in 1749, was still less complicated than the second, and superior in accuracy, as erring only three or four seconds in a week. This he conceived to be the *ne plus ultra* of his attempts; but in an endeavour to improve pocket-watches, he found the principles he applied to surpass his expectations so much, as to encourage him to make his fourth time-keeper, which is in the form of a pocket watch, about six inches diameter. With this time-keeper his son made two voyages, the one to Jamaica, and the other to Barbadoes: in both which experiments it corrected the longitude within the nearest limits required by the act of the 12th of queen Anne; and the inventor therefore, at different times, though not without infinite trouble, received the proposed reward of 20,000l. These four machines were given up to the board of longitude. The three former were not of any use, as all the advantages gained by making them were comprehended in the last; they were worthy, however, of being carefully preserved as mechanical curiosities, in which might be traced the gradations of ingenuity executed with the most delicate workmanship; whereas they now lie totally neglected in the royal observatory at Greenwich. The fourth machine, emphatically distinguished by the name of *The time-keeper*, has been copied by the ingenious Mr KENDAL; and that duplicate, during a three years circumnavigation of the globe in the southern hemisphere by captain Cook, answered as well as the original. The latter part of Mr Harrison's life was employed in making a fifth improved time-keeper on the same principles with the preceding one; which, at the end of a ten weeks trial, in 1772, at the king's private observatory at Richmond, erred only $4\frac{1}{2}$ seconds. Within a few years of his death, his constitution visibly declined; and he had frequent fits of the gout, a disorder that never attacked him before his 77th year: he died at his house in Red-Lion Square, in 1776, aged 83. The recluse manner of his life in the unremitted pursuit of his favourite object, was by no means calculated to qualify him as a man of the world; and the many discouragements he encountered in soliciting the legal reward of his labours, still less disposed him to accommodate himself to the humours of mankind. In conversing on his profession, he was clear, distinct, and modest; yet, like many other mere mechanics, found a difficulty in delivering his meaning by writing; in which he adhered to a peculiar and uncouth phraseology. This was but too evident in his *Description concerning such mechanism as will afford a nice or true mensuration of time*, &c. 8vo. 1775; which his well-known mechanical talents will induce the public to account for from his unacquaintance with letters, from his advanced age, and attendant mental infirmities; among

Harrogate mong which may be reckoned his obstinate refusal to accept of any assistance whatever in this publication. **Hart.** This small work includes also an account of his new musical scale; or mechanical division of the octave, according to the proportion which the radius and diameter of a circle have respectively to the circumference. He had in his youth been the leader of a distinguished band of church-fingers; had a very delicate ear for music; and his experiments on sound, with a most curious monochord of his own improvement, are reported to have been not less accurate than those he was engaged in for the mensuration of time.

HARROGATE, a village in the West Riding of Yorkshire, in the parish of Knaresborough, remarkable for its medicinal springs. These are three in number, all different in their qualities, notwithstanding their contiguity. 1. The Tewet water or Sweet Spa, a vi- triolic spring of a sort of milky taste used in gravelly cases, was discovered by Mr Slingsby 1638. 2. The stinking or sulphur spring, useful in dropical, scorbu- tic, and gouty cases, rises in the town, and is received in four basons under four different buildings; at one it is drunk, at the others used for hot or cold baths. It is perfectly clear; but the taste and smell a composition of rotten eggs, sea-water, and sulphur, and extremely salt. Bathing is the most general mode of using it. It is the strongest sulphur water in Great Britain; and from the superior strength of the impregnating sulphur, it does not lose the sulphureous smell even when exposed to a scalding and almost boiling heat; and in distilling it, when three pints had been taken off from a gallon of it, the last was as strong as the first, and stunk intolerably. It is discutient and attenu- ating, and a warm bath of it is of great benefit in pains and aches, strains and lameness; dissolving hard swell- ings, curing old ulcers and scrophulous complaints, and is a powerful cleanser of the stomach and bowels. 3. St Mungo's well, is so called from Kentigern a Scotch saint much honoured hereabouts, whom his tutor Servanus bishop of Orkney, out of affection for him, called *Mongah*, which in the Norish or Norway language signifies a dear friend.—The Harrogate sea- son is from May to Michaelmas; and the company as- semble and lodge in five or six large houses or inns on the heath, a mile from the village, each house having a long room and an ordinary: the best company used to lodge at Knaresborough, which is three miles off.

HARROW-ON-THE-HILL, a town of Middlesex, so called from its situation on the highest hill in the county, is 10 miles north-west of London. This parish is noted for a free school, founded in the reign of queen Elizabeth. A silver arrow is shot for here once a year, viz. August 4. by a select number of the scholars, who are dressed for the purpose in the habit of archers.

HARROW, in agriculture. See there, n^o 98.

HART, a stag, or male deer, in the sixth year. See **CERVUS**.

HART-Beest, or Quanga. See **CAPRA**.

HART's-Horns, the horns of the common male deer. —The scrapings or raspings of the horn of this ani- mal are medicinal, and used in decoctions, ptisans, &c.

Hartshorn jelly is nutritive and strengthening, and is sometimes given in diarrhoeas; but a decoction of

burnt hartshorn in water is more frequently used for this purpose, and is called *hartshorn drink*. **Hartford.**

The coal of hartshorn, by being calcined with a long continued and strong fire, is changed into a very white earth, called *hartshorn* calcined to whiteness. This earth is employed in medicine as an absorbent, and administered in dysenteries and labour-pains, which are supposed to be caused by acrid and ill-digested mat- ters. This earth levigated is the basis of Sydenham's white decoction, which is commonly prescribed in these diseases.

The salt of haltshorn is a great sudorific, and given in fevers with success; and hartshorn also yields, by distillation, a very penetrative volatile spirit.

HARTFORD, the capital of the county of the same name, signifying, as is commonly thought, the "ford of harts," stands on the river Lea, 21 miles from London; and is of considerable antiquity. Here the East-Saxon kings often kept their court; and here, in 673, was held a synod. King Alfred built a castle here, by which the Danish vessels were destroyed, that came up from the Thames by its river as far as Ware, where the Danes had erected a fort, from which they made frequent sallies to plunder and destroy the coun- try. The present castle consists of a gate-house, or lodge of brick, and a range of brick buildings, which seem of the time of James or Charles I. and also of a very ancient wall of rubble stone, with angular towers, supposed to have been standing ever since its first foun- dation. The manor of this town was all along the king's, of whom both the town and castle were for- merly held *in capite*. The barons took the latter from king John, but Henry III. recovered it. Edward III. gave the town a charter for markets on Thursday and Saturday, and in his grant of it to John of Gaunt it is called *The Honour of Hartford*. It sent members to parliament in the reign of Edward I. but after the 7th of Henry V. on the petition of the bailiff and bur- gesses to be exempted by reason of their poverty, that privilege was discontinued till the 22d of James I. Henry VI. who kept his Easter here in 1429, ordained by his charter, confirming their market, that no other should be kept on the same days, within seven miles, on pain of having the goods seized by the bailiffs of Hartford. This manor being then part of queen Mar- garet's jointure, the courts were held in her name, and she appointed a horse fair to be kept in what part of the town the bailiff and constables thought fit. The standard of weights and measures was fixed here in the reign of Henry VII.; and Mary I. made this a corpora- tion by the name of bailiffs and burgesses, of whom the latter were 16 by her charter. In the 25th and 35th of Elizabeth, Michaelmas-term was kept here, by reason of the plague at both times in London; and that queen, who sometimes resided in its castle, and declared the borough as parcel of her duchy of Lan- caster, granted it a new charter, by the style of a bai- liff, 11 capital burgesses, and 16 assistants, with a mar- ket on Saturday. James I. granted it a new charter, with the style of mayor, burgesses, and commonalty, to have 10 capital burgesses and 16 assistants, the mayor to be chosen out of the former by both of them; and a fair was then appointed here on May 12. Here was once a monastery, founded by a nephew of Wil-

Hartford-shire, Hartland. liam the Conqueror; and here were formerly five churches which are now reduced to two. In St. Andrew's there is a seat not only for the mayor and aldermen, but another for the governors of Christ-church hospital in London, who have erected a house in this town on account of its healthy air and dry situation, to receive such children as wanted either health or room in that hospital; and they have built a gallery in the church, wherein 200 of their children may be accommodated. The town is now governed by a mayor, high-steward, who is generally a nobleman, a recorder, 9 aldermen, a town-clerk, chamberlain, 10 capital burgeses, and 16 assistants, and has 2 serjeants at mace. The chief commodities of its market are wheat, malt, and wool; and it is said to send 5000 quarters of malt to London weekly by the river Lea. Besides the abovementioned, here are two fairs on July 5 and November 8, and two others for cattle, viz. the Saturday fortnight before Easter, and its Midsummer fair is chiefly for horses. Here is a handsome free grammar-school, besides 3 charity-schools; but the splendor of the place is much diminished since the north road from London was turned through Ware. The county gaol, however, is still kept in the town, and the gaol-delivery in the castle. It gives the title of earl to the noble family of Seymour-Conway.

HARTFORDSHIRE, a county of England, deriving its name from Hartford the capital; and that from the harts with which it anciently abounded, being then over-run with woods. It is bounded on the east by Essex, on the west by Bedfordshire and Buckinghamshire, on the south by Middlesex, and on the north by Cambridgeshire. This county is much indented by those that surround it: the longest part is about 35 miles, and the broadest about 27; and the circumference is 190, containing about 451,000 acres. It is divided into eight hundreds, which contain 19 market towns, 54 vicarages, 120 parishes, and near 950 villages, with about 16,500 houses, and 90,000 inhabitants; and sends six members to parliament, two knights for the shire, with two burgeses for St Alban's, and as many for Hartford. Before the reign of queen Elizabeth, one sheriff served both for this shire and Essex; but in the ninth year of her reign, it had one allotted for itself. With regard to ecclesiastical jurisdiction, it belongs partly to the diocese of Lincoln, and partly to that of London. Though the soil in general, especially in the Chiltern and southern parts, is but very indifferent, and much inferior to that of the neighbouring counties; yet the air is so much superior, that lands in this shire generally sell at three or four years purchase more than in many others on that account. But it must be owned, that the soil of Hartfordshire has been much improved of late, by draining, sowing grass seeds, and other methods. There are few or no manufactures in the county; but its markets are much frequented, in consequence of its being near London, for malt and all sorts of grain, which, with the many thoroughfares through it, make ample amends.

HARTLAND, a town in Devonshire, near the Bristol channel, with a market on Saturdays, much frequented by the people of Cornwall, who come hither in boats. It gives its name to a point, called

Hartland Point, at the entrance of Bristol channel. **Hartlepool** W. Long. 4. 45. N. Lat. 51. 9.

HARTLEPOOL, a sea-port town in the county of Durham. It is commodiously seated on a promontory, and is almost encompassed by the sea. It is an ancient corporation, governed by a mayor and aldermen, with other subordinate officers. It is at present a pretty large but poor place. It depends chiefly on the fishing trade; and its harbour is much frequented by colliers passing to and from Newcastle. W. Long. 0. 55. N. 54. 40.

HARTLEY, a town of Northumberland, on the coast, situated northwest of Tynemouth, where Lord Delaval has constructed a pretty haven, whence coals are shipped for London. Here are large salt works and copperas works, and likewise considerable glass works; and there is here a canal cut through a solid rock to the harbour, 52 feet deep, 30 broad, and 900 long. These works are the sole property of Lord Delaval, and yield a revenue of above 20,000*l. per annum*.

HARTLEY (David), M. A. born at Ilkington, where his father was curate, received his academical education at Jesus college, Cambridge, of which he was a fellow. He first began to practise physic at Newark, in Nottinghamshire; from whence he removed to St Edmund's Bury, in Suffolk. After this, he settled for some time in London; and lastly went to live at Bath, where he died in 1757, aged 53, leaving two sons and a daughter. He published "A view of the present evidence for and against Mrs Stephens's * medicines as a solvent for the stone, containing 155 cases, with some experiments and observations;" London, 1739. He is said to have also written against Dr Warren, of St Edmund's Bury, in defence of inoculation; and some letters of his are to be met with in the Philosophical Transactions. The doctor was certainly a man of learning, and reputed a good physician; but too fond of nostrums. But his most considerable literary production is a work intitled, "Observations on man, his frame, his duty, and his expectations, in two parts;" London, 1749, 2 vols. 8vo. The first part contains observations on the frame of the human body and mind, and on their mutual connections and influences. The second part contains observations on the duty and expectations of mankind. *See Stephens's Medicines.*

HARTMAN (John Adolphus), a learned divine and historian, was born at Munster in 1680. After being a Jesuit for several years, he became a Calvinist at Cassel, in 1715; and soon after was made professor of philosophy and poetry, and in 1722 professor of history and eloquence, at Marburg, where he died in 1744. The most esteemed of his works are, 1. The state of the sciences at Hesse, in German. 2. *Historia Hassiaca*, 3 vols. 3. *Præcepta eloquentia rationalis*, &c.

He ought not to be confounded with *George Hartman*, a German mathematician, who, in 1540, wrote a book on perspective; nor with *Wolfgang Hartman*, who, in 1596, composed the Annals of Augsbürg.

HARTOGIA, in botany: A genus of the pentandria order, belonging to the monoecia class of plants; and in the natural method ranking under the 48th order, *Aggregate*. The male calyx is pentaphyllous, the

Haruspices petals five; the female calyx triphyllous, with five petals, and five barren and five castrated stamina. There are three capsules; and the seeds are arillated, or inclosed in a deciduous case.

Harvey.

HARUSPICES, pretenders to divination by certain signs or omens among the Romans.—The Roman haruspices were at first all taken from Hetruria, where their art had most credit. Afterwards young Romans were sent into Hetruria, in order to be brought up in the science. It consisted in foretelling future events by attending to various circumstances of the victims. First, It was an ill omen when the victim would not come to the altar without dragging, when it broke its rope, fled away, avoided the stroke, struggled much after it, made a great bellowing, was long a-dying, or bled but little. Secondly, Presages were drawn from inspecting the noble parts of the victim when opened; as the heart, lungs, spleen, and especially the liver. If all these were found, if the top of the liver was large and well-made, and if its fibres were strong, it presaged well for the affair in question. Thirdly, Knowledge was also drawn by the haruspices from the manner in which the fire consumed the victim. If the flame brightened immediately, was pure and clear, rose up in a pyramid without noise, and did not go out till the victim was consumed, these were happy signs. Fourthly, The smoke also was considered, whether it whirled about in curls, or spread itself to the right or the left, or gave a smell different from the common one of broiled meat. Fifthly, It was a lucky omen if the incense they burned melted all at once, and gave a most agreeable smell.

HARUSPICY. See **HARUSPICES** and **DIVINATION**.

HARVEST, probably derived from a Saxon word signifying *herb feast*, is that season of the year when the corn is ripe and fit to be reaped and gathered into barns.

HARVEST-Fly, in zoology, a large four-winged fly of the cicada kind, very common in Italy, and erroneously supposed to be a grasshopper. See **CICADA**.

HARVEST-Horn, denotes the feast often observed at the close of harvest, and also the song used on that occasion. See **DECEMBER**.

HARVEY (Dr William), an eminent English physician in the 17th century, was incorporated Doctor of physic in Cambridge, afterwards admitted into the college of physicians in London, and was appointed lecturer of anatomy and chirurgery in that college. In these lectures he opened his discovery relating to the circulation of the blood; which, after a variety of experiments, he communicated to the world in his *Exercitatio anatomica de motu cordis et sanguinis*. He was physician to king James I. and to king Charles I. and adhered to the royal cause. His works have eternized his memory. In 1651, he published his *Exercitationes de generatione animalium*, a very curious work; but it would have been more so had not his papers been destroyed during the civil wars. In 1654, he was chosen president of the college of physicians in his absence: but his age and weakness were so great, that he could not discharge the duty of that office; and therefore desired them to choose Dr Pringle. As he had no children, he settled his paternal estate upon the college. He had three years before built a combination-

room, a library, and a museum; and in 1656 he brought the deeds of his estate, and presented them to the college. He was then present at the first feast, instituted by himself, to be continued annually, together with a commemoration speech in Latin, to be spoken on the 18th of October, in honour of the benefactors to the college; he having appointed a handsome stipend for the orator, and also for the keeper of the library and museum, which are still called by his name. He died in 1657.

This great physician had the happiness, in his lifetime, to find the clamours of ignorance, envy, and prejudice, against his doctrine, totally silenced, and to see it universally established. It has, by length of time, been more and more confirmed, and every man now sees and knows it from his own experience. It appears to be of the utmost importance in medicine; as it is perhaps impossible to define health and sickness in fewer words, than that the one is a free, and the other an obstructed, circulation.—Dr Harvey was not only an excellent physician, but an excellent man; his modesty, candour, and piety, were equal to his knowledge; the farther he penetrated into the wonders of nature, the more he was inclined to venerate the Author of it.

HARWICH, a town of Essex, in England, 72 miles from London. It is not large; but is well built and populous, has a good maritime trade, is almost encompassed by the sea, and has strong works. It is walled in; and the streets are paved for the most part with clay, which tumbling down from the cliff, where is a petrefying water between the town and Beacon-Hill, soon grows as hard as stone; and the inhabitants boast the wall is as strong and the streets are as clean as those that are of real stone. The harbour or bay is very large, safe, and deep; and is commanded by a strong fort on the Suffolk side, though not in that county. Here is a dock belonging to the government, with all conveniences for building, cleaning, and refitting men of war. A little way from the town, on a high hill called *Beacon-hill*, is a very fine light-house, which is seen at a great distance, and is very useful on this dangerous coast. At this place the packet-boats which pass between England and Holland are stationed, and the town is much benefited by the passengers. The bay is so spacious, by the influx of the Stour from Manningtree, and the Orwell from Ipswich, and such use was made of it in the Dutch war, that 100 sail of men of war have been seen there at one time, with their tenders, besides 300 or 400 sail of colliers; for it is a perfect harbour to within two miles of Ipswich, and able to receive ships of 100 guns all the way. The inns here are very good; but the accommodations dear, by reason of the great concourse of passengers to and from Holland, which was the motive of fitting up sloops to go thither directly from the Thames, when the stage-coaches that used to ply two or three times a week between this place and London were laid down. This place was first made a free borough, and had a grant of its market on Tuesdays in the reign of Edward II. Its government was settled by charter of king James I. in a mayor, chosen yearly, November 30, out of eight aldermen, who with 24 capital burgeses, the electors, and the recorder, make the corporation. By this charter it had also a power to elect two bur-

Harvey,
Harwich.

geses

Harwood

Hasp.

gesles to parliament, the grant of its Friday market, and its two fairs on May-day and October 18. which are each for three days. The town has also an admiralty jurisdiction within its liberties, and the return of all writs, fines, &c. Though the entrance into the sea here is between two and three miles wide at high-water, yet the channel where the ships must keep to come to the harbour, which is on the Suffolk side, is deep and narrow; so that all ships that come in or go out are commanded by the guns of Landguard-Fort on that side. This town was fortified heretofore on the land side, but in the reign of king Charles I. the fortifications were demolished. It has since been ordered to be refortified.—The church here, ever since the reformation, has been a chapel to the mother-church at Dover-Court.

HARWOOD, a small but pretty town in the north riding of Yorkshire, with a costly stone-bridge of 11 arches over the Wharfe, which runs in a bed of stone, and is as clear as rock-water. Near it are the ruins of an ancient castle, built soon after the conquest; and which remained a neat strong building in Cambden's time. It had a variety of masters; one of whom, in the reign of king John, obtained a grant for a market and fair here. In the reign of Edward III. it was valued at 400 marks a-year. This castle was ruined in the civil wars. It has eight or nine dependent constabularies, wherein are many antiquities. The remains of the castle, which seems to have been the keep, is in a condition to exist long. The castle itself covered near an acre of ground. Near it is now Harwood-House, one of the first houses in the county for elegance and superior embellishments; built on part of the site of Gawthorp-Hall, now no more. In the church are some ancient monuments, particularly that of lord chief-justice Gascoigne, who committed the Prince of Wales to prison for striking him on the bench.

HASLEMERE, a town of Surry, in England, seated on the edge of the county next Hampshire, 43 miles from London, is an ancient place, and was once destroyed by the Danes. It is a borough by prescription, and has sent members to parliament ever since the reign of Edward IV. who are chosen by a bailiff and burgrave-teeners. It is said to have had seven parish-churches formerly, though but one church now, which is a chapel of ease to Chidingfold; and that it stood heretofore upon a hill more to the south than the present town.

HASSELQUISTA, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatae*. The fruits are quite smooth; the seeds of the radius oval, plane, marginated, and convex in the middle; those in the disk hemispherical and urceolated or bladder-shaped.

HASSELT, a handsome town of the United Provinces, in Overysse, seated on the river Wecht, in E. Long. 6. 5. N. Lat. 23. 46.

HASSELT, a town of Germany, in the circle of Westphalia, and in the territory of Liege, situated on the river Demer, in E. Long. 4. 49. N. Lat. 50. 55.

HASSIDEANS, or ASSIDEANS. See ASSIDEANS.

HASSOCK, a baf made of rushes, to kneel or rest the feet upon in churches.

HASP and STAPLE, in Scots law, the symbol com-

monly used in burgrave tenements for entering and infesting an heir, by delivering into his hands the hasp and staple of the door.

HASTA, or *HASTA Pura*, among medalists, signifies a kind of spear or javelin, not shod or headed with iron; or rather an ancient sceptre, somewhat longer than ordinary, occasionally given to all the gods.

The hasta is supposed a symbol of the goodness of the gods, and of the conduct of providence, which is equally mild and forcible.

HASTA, in some countries, is a measure or quantity of ground amounting to thirty paces: thus called, according to M. Du-Cange, from the hasta or rod where-with it was measured.

HASTATED LEAF. See BOTANY, p. 442.

HASTING-PEAR, a name given by the gardeners to a species of pear, called also by some the *green chissel pear*. This is a moderately large pear, and is longish towards the pedicle; its skin is thin, and of a whitish green; the pulp is melting, and of a sugary flavour. It ripens in July.

HASTINGS, a town of Suffex in England, 64 miles from London. It is the chief of the cinque-ports; and was formerly obliged to find 21 ships, within 40 days after the king's summons, well furnished and armed for service, and to maintain the crews a fortnight at its own charge. This town is supposed to have taken its name from Hastings, the famous Danish pirate, who used to build fortresses where he went ashore for his prey, to cover his men, and secure his retreat. In king Athelstan's reign here was a mint. This town had charters from Edward the Confessor, William I. and II. Henry II. Richard I. Henry III. Edward I. and Charles II. exempting it from toll, and empowering it to hold courts of judicature on life and death. It is incorporated by the style of mayor, jurats, and commonalty. It has handsome houses, and customhouse officers; but frequent storms have rendered it an indifferent harbour, though a vast sum of money has been laid out at times to make it a good one. It has sent members to parliament ever since Edward III. London is supplied from hence with abundance of fish that are taken on the coast. The town lies between two high cliffs towards the sea, and as high a hill on the land side, having two streets, and in each a parish-church, divided by a stream of fresh water called the Bourne. About the year 1377, this town was burnt by the French; and after it was rebuilt, it was divided into the two parishes. Here are two charity schools, erected for the teaching of 200 or 300 children. There was a castle on the hill, which overlooked the town, but it is now in ruins. The markets here are on Wednesdays and Saturdays: the fairs are on Tuesday and Wednesday in Whitsun-week, and July 26, October 23, and 24. Here was formerly a priory. Hastings was a barony in the Huntington family, now in the Rawdon family.

This town is remarkable for a battle fought in its neighbourhood, between Harold king of England and William duke of Normandy, on the 15th of October 1066, in which the former was defeated and killed; and by his death William, surnamed the *Conqueror*, became king of England: (See ENGLAND, n^o 86.)—The night before the battle, the aspect of things was very different in the two camps. The English spent the time in riot, jollity, and disorder; the Normans in prayer and

Hasta

Hastings.

Hastings and other duties of religion. The next day both armies prepared for battle. The duke divided his army into three lines: the first, headed by Montgomery, consisted of archers and light-armed infantry: the second, commanded by Martel, was composed of his bravest battalions, heavy-armed, and ranged in close order: his cavalry, at whose head he placed himself, formed the third line; and were so disposed, that they stretched beyond the infantry, and flanked each wing of the army. He ordered the signal of battle to sound; and the whole army, moving at once, and singing the hymn or song of Roland the famous peer of Charlemagne, advanced, in order and with alacrity, towards the enemy.

Harold had seized the advantage of a rising ground, and having besides drawn some trenches to secure his flanks, he resolved to stand upon the defensive, and to avoid all action with the cavalry, in which he was inferior. The Kentish men were placed in the van, a post which they had always claimed as their due; the Londoners guarded the standard; and the king himself, accompanied by his two valiant brothers, Gurth and Leofwin, dismounting from horseback, placed himself at the head of his infantry, and expressed his resolution to conquer or to perish in the action. The first attack of the Normans was desperate, but was received with equal valour by the English: and after a furious combat, which remained long undecided, the former, overcome by the difficulty of the ground, and hard pressed by the enemy, began first to relax their vigour; then to give ground; and confusion was spreading among the ranks, when William, who found himself on the brink of destruction, hastened, with a select band, to the relief of his dismayed forces. His presence restored the action; the English were obliged to retreat with loss; and the duke, ordering his second line to advance, renewed the attack with fresh forces and with redoubled courage. Finding that the enemy, aided by the advantage of ground, and animated by the example of their prince, still made a vigorous resistance, he tried a stratagem, which was very delicate in its management, but which seemed advisable in his desperate situation, when, if he gained not a decisive victory, he was totally undone: he commanded his troops to make a hasty retreat, and to allure the enemy from their ground by the appearance of flight. The artifice succeeded against these unexperienced troops; who, heated by the action, and sanguine in their hopes, precipitantly followed the Normans into the plain. William gave orders, that at once the infantry should face about upon their pursuers, and the cavalry make an assault upon their wings, and both of them pursue the advantage which the surprize and terror of the enemy must give them in that critical and decisive moment. The English were repulsed with great slaughter, and driven back to the hill; where being rallied again by the bravery of Harold, they were able, notwithstanding their loss, to maintain the post and continue the combat. The duke tried the same stratagem a second time with the same success; but even after this double advantage, he still found a great body of the English, who, maintaining themselves in firm array, seemed determined to dispute the victory to the last extremity. He ordered his heavy-armed infantry to make the as-

fault upon them; while his archers, placed behind, should gall the enemy, who were exposed by the situation of the ground, and who were intent in defending themselves against the swords and spears of the assailants. By this disposition he at last prevailed. Harold was slain by an arrow, while he was combating with great bravery at the head of his men. His two brothers shared the same fate; and the English, discouraged by the fall of these princes, gave ground on all sides, and were pursued with great slaughter by the victorious Normans. A few troops, however, of the vanquished dared still to turn upon their pursuers; and taking them in deep and miry ground, obtained some revenge for the slaughter and dishonour of the day. But the appearance of the duke obliged them to seek their safety by flight, and darkness saved them from any farther pursuit by the enemy.

Thus was gained by William duke of Normandy, the great and decisive victory of Hastings, after a battle which was fought from morning till sunset, and which seemed worthy, by the heroic feats of valour displayed by both armies, and by both commanders, to decide the fate of a mighty kingdom. William had three horses killed under him; and there fell near fifteen thousand men on the side of the Normans. The loss was still more considerable on that of the vanquished; besides the death of the king and his two brothers. The dead body of Harold was brought to William, who restored it without ransom to his mother.

HASTIVE, a French term, sometimes used in English for early, forward, or something that comes before the ordinary time or season. The hative fruits are strawberries and cherries. We have hative peas, &c.

HAT, a covering for the head, worn by the men throughout the western part of Europe. Hats are said to have been first seen about the year 1400, at which time they became of use for country wear, riding, &c. F. Daniel relates, that when Charles II. made his public entry into Rozen, in 1449, he had on a hat lined with red velvet, and surmounted with a plume or tuft of feathers: he adds, that it is from this entry, or at least under this reign, that the use of hats and caps is to be dated, which henceforward began to take place of the chaperons and hoods that had been worn before. In the process of time, from the laity, the clergy also took this part of the habit; but it was looked on as a great abuse, and several regulations were published, forbidding any priest or religious person to appear abroad in a hat without coronets, and enjoining them to keep to the use of chaperons, made of black cloth, with decent coronets; if they were poor, they were at least to have coronets fastened to their hats, and this upon penalty of suspension and excommunication. Indeed the use of hats is said to have been of a longer standing among the ecclesiastics of Brittany, by two hundred years, and especially among the canons; but these were no other than a kind of caps, and from hence arose the square caps worn in colleges, &c. Lobineau observes, that a bishop of Dol, in the 12th century, zealous for good order, allowed the canons alone to wear such hats; enjoining, that if any other person come with them to church, divine service should immediately be suspended.

Hata

Hastings

Hat.

Hats.

Hats make a very considerable article in commerce: the finest, and those most valued, are made of pure hair of an amphibious animal, called the castor or beaver, frequent in Canada and other provinces of North America. See BEAVER.

Method of making Hats. Hats are made either of wool, or hair of diverse animals, particularly of the castor, hare, rabbit, camel, &c. The process is much the same in all; for which reason we shall content ourselves to instance in that of castors.

The skin of this animal is covered with two kinds of hair; the one long, stiff, glossy, and pretty thin set; this is what renders the skin or fur of so much value: the other is short, thick, and soft, which alone is used in hats.

To tear off one of these kinds of hair, and cut the other, the hatters, or rather the women employed for that purpose, make use of two knives, a large one like a shoemaker's knife for the long hair; and a smaller, not unlike a vine knife, wherewith they shave or scrape off the shorter hair.

When the hair is off, they mix the stuff; to one third of dry castor putting two-thirds of old coat, i. e. of hair which has been worn some time by the savages, and card the whole with cards, like those used in the woollen manufactory, only finer; this done, they weigh it, and take more or less according to the size or thickness of the hat intended. The stuff is now laid on the hurdle, which is a square table, parallel to the horizon, having longitudinal chinks cut through it; on this hurdle, with an instrument called a *bow*, much like that of a violin, but larger, whose string is worked with a little bow stick, and thus made to play on the furs, they fly and mix together, the dust and filth at the same time passing through the chinks; this they reckon one of the most difficult operations in the whole, on account of the justness required in the hand to make the stuff fall precisely together, and that it may be every where of the same thickness. In lieu of a bow, some hatters make use of a sieve or scarce of hair, through which they pass the stuff.

After this manner they form gores, or two capades, of an oval form, ending in an acute angle at top; and with what stuff remains, they supply and strengthen them in places where they happen to be slenderer than ordinary; though it is to be remembered, that they designedly make them thicker in the brim, near the crown, than toward the circumference, or in the crown itself.

The capades thus finished, they go on to harden them into closer and more consistent flakes by pressing down a hardening skin or leather thereon; this done, they are carried to the bason, which is a sort of bench with an iron plate fitted therein, and a little fire underneath it; upon which laying one of the hardened capades, sprinkled over with water, and a sort of mould being applied thereon, the heat of the fire, with the water and pressing, imbody the matter into a slight hairy sort of stuff or felt; after which, turning up the edges all round the mould, they lay it by, and thus proceed to the other: this finished, the two next are joined together, so as to meet in an angle at the top, and only form one conical cap, after the manner of a *manica Hippocratis*, or flannel bag.

N^o 149.

Hats.

The hat thus basoned, they remove it to a large kind of receiver or trough, resembling a mill-hopper, going sloping or narrowing down from the edge or rim to the bottom, which is a copper kettle filled with water and grounds, kept hot for that purpose. On the descent or sloping side, called the *plank*, the basoned hat, being first dipped in the kettle, is laid; and here they proceed to work it, by rolling and unrolling it again and again, one part after another, first with the hand, and then with a little wooden roller, taking care to dip it from time to time, till at length by thus fulling and thickening it four or five hours, it is reduced to the extent or dimensions of the hat intended. To secure the hands from being injured by this frequent rolling, &c. they usually guard them with a sort of thick gloves.

The hat thus wrought, they proceed to give it the proper form, which is done by laying the conical cap on a wooden block, of the intended size of the crown of the hat, and thus tying it round with a packthread, called a *commander*: after which, with a piece of iron, or copper bent for that purpose, and called a *flamper*, they gradually beat or drive down the commander all round, till it has reached the bottom of the block, and thus is the crown formed; what remains at bottom below the string being the brim.

The hat being now set to dry, they proceed to finge it, by holding it over a flare of straw or the like; then it is pounced, or rubbed over with pumice, to take off the coarser knap; then rubbed over afresh with seal-skin to lay the knap a little finer; and lastly, carded with a fine card to raise the fine cotton, with which the hat is afterwards to appear.

Things thus far advanced, the hat is thus sent, upon its block, and tied about with a packthread as before, to be dyed. The dye being completed, the hat is returned to the hatter, who proceeds to dry it, by hanging it in the top or roof of a stove or oven, at the bottom of which is a charcoal fire; when dry, it is to be stiffened, which is done with melted glue or gum senegal, applied thereon by first smearing it, and beating it over with a brush, and then rubbing it with the hand. The next thing is to steam it on the steaming bason, which is a little hearth or fire-place, raised three feet high with an iron-plate laid over it, exactly covering the hearth; on this plate they first spread cloths, which being sprinkled over with water to secure the hat from burning, the hat is placed brim downwards thereon; when moderately hot, the workman strikes gently on the brim with the flat of his hand, to make the joinings incorporate and bind so as not to appear; turning it from time to time, this way and that way, and at last overturning and setting it in the crown. When steamed sufficiently, and dried, they put it again on the block, and brush and iron it on a table or bench for the purpose, called the *stall-board*; this they perform with a sort of irons like those commonly used in ironing linen, and heated like them; which being rubbed over and over each part of the hat, with the assistance of the brush, smoothes and gives it a gloss, which is the last operation; nothing now remaining but to clip the edges even with scissors, and sew a lining to the crown.

Dyeing

Ha,
Hatch.

Dyeing of Hats. The instructions of Mr Colbert direct hats to be first strongly galled, by boiling them a long time in a decoction of galls with a little logwood, that the dye may penetrate the better into their substance; after which a proper quantity of vitriol, and decoction of logwood, with a little verdigris, are added, and the hats continued in this mixture also for a considerable time. They are afterwards to be put into a fresh liquor of logwood, galls, vitriol, and verdigris; and where the hats are of great price, or of a hair which difficultly takes the dye, the same process is to be repeated a third time. For obtaining the most perfect colour, the hair or wool is to be dyed blue previously to its being formed into hats.—The present practice is more compendious, and affords, as we may daily see, a very good black. According to Dr Lewis, it does not materially differ from that of the *Encyclopédie*, which is as follows.

An hundred pounds of logwood, 12 pounds of gum, and six pounds of galls, are boiled in a proper quantity of water for some hours; after which, about six pounds of verdigris and ten of green vitriol are added, and the liquor kept just simmering, or of a heat a little below boiling. Ten or twelve dozen of hats are immediately put in, each on its block, and kept down by cross bars for about an hour and an half: they are then taken out and aired, and the same number of others put in their room. The two sets of hats are thus dipped and aired alternately, eight times each; the liquor being refreshed each time with more of the ingredients, but in less quantity than at first.

This process (says Dr Lewis) affords a very good black on woollen and silk stuffs as well as on hats, as we may see in the small pieces of both kinds which are sometimes dyed by the hatters. The workmen lay great stress upon the verdigris, and affirm that they cannot dye a black hat without it: it were to be wished that the use of this ingredient were more common in the other branches of the black dye; for the hatters dye, both on silk and woollen, is reckoned a finer black than what is commonly produced by the woollen and silk dyer.

HATS are also made for womens wear, not only of the above stuffs, but of chips, straw, or cane, by plaiting, and sewing the plaits together; beginning with the centre of the crown, and working round till the whole is finished. Hats for the same purpose are also wove and made of horse-hair, silk, &c.

HAT is also figuratively used for the dignity of cardinal, or a promotion to that dignity. In this sense they say, "to expect the hat; to claim, or have pretensions to, the hat," &c.

Pope Innocent IV. first made the hat the symbol or cognizance of the cardinals, enjoining them to wear a red hat at the ceremonies and processions, in token of their being ready to spill their blood for Jesus Christ.

HATCH, or HATCHWAY, a square or oblong opening in the DECK of a ship, of which there are several, forming the passages from one deck to another, and into the hold or lower apartments. See Plate CLVI. where A represents the main-hatchway of the lower deck; NN the fore-hatchway; and OO the after-hatchway.—There are likewise hatches of a smaller kind, called *scuttles*. See UU in the same figure; as also the article SCUTTLE.—Hatches is also, though

VOL. VIII. Part I.

improperly, a name applied by sailors to the covers or lids of the hatchway.

HATCHEL, or HITCHEL, in the manufactory of flax, hemp, &c. a tool, not unlike a card, for dressing and combing them into fine hairs.

They consist of sharp-pointed iron pins, or teeth, set orderly in a board.

Of these there are several sorts, some with finer and shorter teeth, others with them coarser and longer.

HATCHES, in mining, a term used in Cornwall, to express any of the openings of the earth either into mines or in search of them. The fruitless openings are called *essay-hatches*; the real mouths of the veins, *tin-hatches*; and the places where they wind up the buckets of ore, *wind-hatches*.

HATCHES also denote flood-gates set in a river, &c. to stop the current of the water, particularly certain dams or mounds made of rubbish, clay, or earth, to prevent the water that issues from the stream-works and tin-washes in Cornwall from running into the fresh rivers.

HATCHET, a small light sort of an axe, with a basil edge on its left side, and a short handle, as being to be used with one hand.—Hatchets are used by various artificers, and more particularly in hewing of wood.

HATCHING, the maturing fecundated eggs, whether by the incubation and warmth of the parent bird, or by artificial heat, so as to produce young chickens alive.

The art of hatching chickens by means of ovens has long been practised in Egypt; but it is there only known to the inhabitants of a single village named *Berme*, and to those that live at a small distance from it. Towards the beginning of autumn they scatter themselves all over the country; where each person among them is ready to undertake the management of an oven, each of which is of a different size; but, in general, they are capable of containing from forty to fourscore thousand eggs. The number of these ovens placed up and down the country is about 386, and they usually keep them working for about six months: as, therefore, each brood takes up in an oven, as under a hen, only 21 days, it is easy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the person who intrusts him with an oven, only two-thirds of as many chickens as there have been eggs put under his care; and he is a gainer by this bargain, as more than two-thirds of the eggs usually produce chickens. In order to make a calculation of the number of chickens yearly so hatched in Egypt, it has been supposed that only two-thirds of the eggs are hatched, and that each brood consists of at least 30,000 chickens; and thus it would appear, that the ovens of Egypt give life yearly to at least 92,640,000 of these animals.

This useful and advantageous method of hatching eggs has been lately discovered in France by the ingenious Mr Reaumur; who, by a number of experiments, has reduced the art to certain principles. He found by experience, that the heat necessary for this purpose is nearly the same with that marked 32 on his thermometer, or that marked 96 on Fahrenheit's. This degree of heat is nearly that of the skin of the hen, and, what is remarkable, of the skin of all other domestic fowls,

Hatche!
||
Hat ching.

T t

Hatching. fowls, and probably of all other kinds of birds. The degree of heat which brings about the developement of the cygnet, the gosling, and the turkey-pout, is the same as that which fits for hatching the canary-songster, and, in all probability, the smallest humming-bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds; it will bring the canary bird to perfection in 11 or 12 days, while the turkey-pout will require 27 or 28.

After many experiments, Mr Reamur found, that stoves heated by means of a baker's oven, succeeded better than those made hot by layers of dung: and the furnaces of glass-houses and those of the melters of metals, by means of pipes to convey heat into a room, might, no doubt, be made to answer the same purpose. As to the form of the stoves, no great nicety is required. A chamber over an oven will do very well. Nothing more will be necessary but to ascertain the degree of heat; which may be done by melting a lump of butter of the size of a walnut, with half as much tallow, and putting it into a phial. This will serve to indicate the heat with sufficient exactness: for when it is too great, this mixture will become as liquid as oil; and when the heat is too small, it will remain fixed in a lump: but it will flow like a thick syrup, upon inclining the bottle, if the stove be of a right temper. Great attention therefore should be given to keep the heat always at this degree, by letting in fresh air if it be too great, or shutting the stove more close if it be too small: and that all the eggs in the stove may equally share the irregularities of the heat, it will be necessary to shift them from the sides to the centre; and thus to imitate the hens, who are frequently seen to make use of their bills, to push to the outer parts those eggs that were nearest to the middle of their nests, and to bring into the middle such as lay nearest the sides.

Mr Reamur has invented a sort of low boxes, without bottoms, and lined with furs. These, which he calls *artificial parents*, not only shelter the chickens from the injuries of the air, but afford a kindly warmth, so that they presently take the benefit of their shelter as readily as they would have done under the wings of a hen. After hatching, it will be necessary to keep the chickens, for some time, in a room artfully heated and furnished with these boxes; but afterwards they may be safely exposed to the air in the court-yard, in which it may not be amiss to place one of these artificial parents to shelter them if there should be occasion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up insects and grubs for themselves.

But to save the trouble of attending them, capons may be taught to watch them in the same manner as hens do. Mr Reamur assures, that he has seen above 200 chickens at once, all led about and defended only by three or four such capons. Nay, cocks may be taught to perform the same office; which they, as well as the capons, will continue to do all their lives after.

HATCHING, or HACHING, in designing, &c. the

making of lines with a pen, pencil, graver, or the like; and the intersecting or going across those lines with others drawn a contrary way, is called *counter-hatching*. The depths and shadows of draughts are usually formed by hatching.

Hatching is of singular use in heraldry, to distinguish the several colours of a shield, without being illumined: thus, gules or red is hatched by lines drawn from the top to the bottom; azure, by lines drawn across the shield; and so of other colours.

HATCHMENT, in heraldry, the coat-of-arms of a person dead, usually placed on the front of a house, whereby may be known what rank the deceased person was of when living: the whole distinguished in such a manner as to enable the beholder to know whether he was a bachelor, married man, or widower; with the like distinctions for women.

Bishop's-HATFIELD, a town of Hertfordshire in the great coach-road to the north, 19 miles from London. It was called Bishops-Hatfield, because it did belong to the Bishops of Ely. Theodore archbishop of Canterbury held a synod here, anno 681, against the Eutychian heresy. Here was once a royal palace, from whence both Edward VI. and Queen Elizabeth were conducted to the throne. King James I. exchanged the manor with Sir Robert Cecil, afterwards earl of Salisbury, for Theobald's, in the parish of Cheshunt in this county; and the lordship still remains in that noble family, who have a very fine seat here. The rectory, which is in that earl's gift, is reckoned worth 800 pounds a year. Here are two charity schools; and there is a market on Thursdays, with two fairs in April and October.

HATFIELD and CHACE, a town in the west riding of Yorkshire, four miles from Doncaster. The chace is famous for deer-hunting. There are many intrenchments near the town, as if it had been the camp of some great army. It is said that no rats were ever seen in this town.

HATFIELD BROAD-OAK, or *King's Hatfield*, a town of Essex in England, seated on a branch of the river Lea, 30 miles from London, is so called from the nature of the soil, from its tenure by king William the Conqueror and his successors, and from a broad oak growing in the town. It has a market on Saturdays, and a fair in August.

HATTEM, a town of the United Provinces, in the duchy of Guelderland, seated on the river Uffel, in E. Long. 6. o. N. Lat. 53. 30.

HATTEMISTS, in ecclesiastical history, the name of a modern Dutch sect, so called from Pontian Van Hattem, a minister in the province of Zealand, towards the close of the last century, who being addicted to the sentiments of Spinoza, was on that account degraded from his pastoral office. The Verschorists and Hattemists resemble each other in their religious systems, though they never so entirely agreed as to form one communion. The founders of these sects deduced from the doctrine of absolute decrees a system of fatal and uncontrollable necessity; they denied the difference between moral good and evil, and the corruption of human nature: from hence they farther concluded, that mankind were under no sort of obligation to correct their manners, to improve their minds, or to obey the divine laws; that the whole of religion consisted

not

Hattock
Havanna.

not in acting, but in suffering; and that all the precepts of Jesus Christ are reducible to this one, that we bear with cheerfulness and patience the events that happen to us through the divine will, and make it our constant and only study to maintain a permanent tranquillity of mind. Thus far they agreed; but the Hattomists farther affirmed, that Christ made no expiation for the sins of men by his death, but had only suggested to us by his mediation, that there was nothing in us that could offend the Deity; this, they say, was Christ's manner of justifying his servants, and presenting them blameless before the tribunal of God. It was one of their distinguished tenets, that God does not punish men for their sins, but by their sins. These two sects, says Mosheim, still subsist, though they no longer bear the names of their founders.

HATTOCK, a shock of corn containing twelve sheaves; others make it only three sheaves laid together.

HATUAN, a town and fort of Upper Hungary, in the county of Novigrod. It was taken by the Imperialists in 1685. It is seated on a mountain, in E. Long. 19. 48. N. Lat. 47. 52.

HAVANNA, a sea-port town of America, in the island of Cuba, and on the north-west part of it, opposite to Florida. It is famous for its harbour, which is in every respect one of the best in the West Indies, and perhaps in the world. It is entered by a narrow passage, upwards of half a mile in length, which afterwards expands into a large basin, forming three Cul de Sacs, and is sufficient, in extent and depth, to contain 1000 sail of the largest ships, having almost throughout six fathom water, and being perfectly covered from every wind. The town was built by Diego de Velasquez, who conquered the island of Cuba. It was but a small place, and named originally the port of Carenas; but afterwards, when the city by its increase of wealth grew considerable, it was called *St Christopher of the Havanna*. In 1536, it was of so inconsiderable a value, that being taken by a French pirate, he ransomed the place for the paltry sum of 700 pieces of eight. Some time after it was taken by the English, and a second time by the French: nor was its value understood, or any care taken to put it in a posture of defence, till the reign of Philip II.; though what was then done proved insufficient. But since the accession of a branch of the House of Bourbon to the Spanish crown, more pains have been taken to render it a place of strength.

The Havanna stands on the west side of the harbour, in a pleasant plain; and is the residence of the governor and captain-general of Cuba, and of the royal officers, as well as of an assessor for the assistance of the governor and captain-general of the West Indies. The bishop of St Jago de Cuba likewise chooses to fix his residence here. The buildings are elegant, built of stone, and some of them most superbly furnished. Here are eleven churches and monasteries, and two handsome hospitals. Near the middle of the town is a spacious square, surrounded with uniform buildings. The churches are rich and magnificent; the lamps, candlesticks, and ornaments for the altars being of gold and silver; some of the lamps are of the most curious workmanship, and weigh near 100 weight. The Recollects church, which stands on the best ground in

the city, has 12 beautiful chapels in it, and in the monastery are cells for 50 fathers. The church of St Clara has seven altars adorned with plate, and the nunnery contains 100 women and servants, all clothed in blue. The church belonging to the Augustines has 13 altars; that of St Juan de Dios 9, with an hospital for soldiers of 12,000 pieces of eight revenue. It is not a bishop's see, though the bishop of St Jago resides here, the revenue of which prelate is not less than 50,000 pieces of eight a-year. In 1700 the inhabitants were computed at 26,000, and we may very well imagine them to be increased since. They are a more polite and social people than the inhabitants of any of the Spanish ports on the continent; and of late imitate the French both in their dress and manners. The city is supplied with water by a small river called *Lagida*, which rises from the hills on the south-west side of the town, and divides itself into three streams, one of which falls into the sea on the east side of the town, but the other two flow through the place, entering the walls near the middle of the city.

As to the fortifications, it was already remarked, that the entrance to the harbour is by a narrow gut near half a mile in length: this passage is defended on the east side by a strong castle called *El Moro*, situated on a high rock; and on the walls and bastions are mounted 40 pieces of cannon. Under the faces of the south-west bastion of the Moro, and more within the entrance of the harbour, is a battery of stone called the *Twelve Apostles*, almost level with the water, and the guns of which carry each a ball of 36 pounds. A little higher, and opposite to the Point gate, is the *La Divina Pastora*, or the Shepherd's Battery, of 14 guns, level with the water. On the west side of the entrance, at the point, is a square fort called the *Punta*, with four bastions well mounted with cannon, about 200 yards distant from the Punta gate of the town. On the bastions of the town, next the harbour, are a number of cannon; and about the middle of the city is another fort, called *El Fuerte*, a square fort with four bastions, mounted with 22 pieces of cannon, of no great strength; but in this last the governor resides, and in it the king of Spain's treasures are deposited till the arrival of the galleons. On the land-side, from the Punta gate to the dock-yard, there is a rampart with bastions, faced with stone, and earthen parapets with a ditch, which in several places has fallen in, and is almost filled up, particularly behind the Punta and land-gates, near the stone quarries, which, if joined to one another, might be of great detriment to the place in case of a siege, as a lodgement might be made in them. The ground here rises with an easy ascent to the land-gate; and is either open pasture or garden ground, well stored with the cabbage-tree. Before the land-gate is a ravelin. The hill on a rising ground from this gate (which is the highest part of the town) to the dock-yard, is steeper than on the other side.

Such are the fortifications of the Havanna, which are the best the Spaniards have in the West Indies, as indeed the place is of the greatest importance. But though strong, they have many defects, and from the situation of the town and forts, are commanded by many eminences, of which an enemy could not fail to take advantage. On the east side of the harbour, the Cavannas, on a part of which the Moro is built,

Havanna.

Havanna. commands in a great measure that fort, but absolutely commands the Punta, El Fuerte, and whole north-east part of the city, which is the best fortified. On the west side of the city runs a suburb, called *Guadaloupe*, whose church is situated on an eminence about half a mile from the land-gate, which it is on a level with, and higher than any other part of the fortifications. From the north side of this rising ground, the Punta gate may be flanked; and from the south-east side the dock-yard is commanded. Along the north side runs an aqueduct, which falling into the ditch at the land-gate, runs down to the dock-yard, both for watering the ships and turning a saw-mill. About half a mile from the church, is a bridge made over a rivulet that runs into the bay about 100 yards. That road leads to the centre of the island, and extends to Baracoa, above 600 miles distant. From this bridge to the Lazaretto, is about two miles, with a rising ground betwixt them. A trench thrown up between these two places would cut off the communication with the town by land. From these observations it will plainly appear, that the Havanna, though well fortified, is not impregnable.

The Havanna has greatly contributed to the maritime strength of the crown of Spain, many ships having been built here within these few years, from 60 to 80 guns, the island furnishing the finest materials, such as oak, pine, cedar, and mahogany. The only defect of the harbour is the narrowness of its entry: for though free from bars and shoals, yet only one ship at a time can enter it; from which circumstance the galleons have more than once been insulted, and some of them taken, at the mouth of the harbour, the forts there not being able to afford them any assistance.

Upon the rupture with Spain in 1762, the British ministry sent a squadron and army against this place under the command of admiral Pocock and lord Albemarle. The Spaniards had in the harbour at the time a fleet of twelve sail of the line, two of them but just launched, two more on the stocks nearly finished, and several merchant ships. The men of war were almost ready for sea; but no account had reached the governor of the intended attack. The place, however, was gallantly defended, and sustained a siege of two months and eight days before it could be reduced; when a capitulation was signed, and along with the city was yielded a district of 180 miles to the westward. This conquest was without doubt in itself the most considerable, and in its consequences the most decisive, of any we had made since the beginning of the war; and in no operation were the courage, steadiness, and perseverance of the British troops, and the conduct of their leaders, more conspicuous. The acquisition of this place united in itself all the advantages which can be acquired in war. It was a military achievement of the highest class. By its effect on the enemy's marine it was equal to the greatest naval victory, and in the plunder it equalled the produce of a national subsidy. Nine sail of the enemy's line-of-battle ships were taken; three of their capital ships had been sunk by themselves at the beginning of the siege; two more were in forwardness upon the stocks, and were afterwards destroyed by the captors. The enemy on this occasion lost a whole fleet of ships of war, besides a number of considerable merchant ships; and in ready

money, in tobacco collected at the Havanna on account of the king of Spain, and in other valuable merchandizes, the sum lost by the enemy perhaps did not fall short of three millions sterling.

The city of Havanna was restored by the peace of 1763; and is of the greatest importance to Spain, being the rendezvous for all their fleets to return from America to Europe, lying at the mouth of the gulph of Florida, through which they are all obliged to pass. Here the navy of Spain stationed in the West Indies ride; and here the galleons, the flota, and other merchant ships from other ports both of the continent and islands, meet in September, to take in provisions and water, with great part of their lading, and for the convenience of returning to Spain in a body. A continual fair is held till their departure, which generally happens before the end of the month, when proclamation is made, forbidding any person belonging to the fleet to stay in town on pain of death; and accordingly, on firing the warning gun, they all retire on board.—The commerce carried on in this port, which is very considerable, may be distinguished into the particular commerce of the island of Cuba, and that more general by the galleons and flota. The former consists in hides, usually styled of the Havanna, which are excellent, and of great value; sugar, tobacco, admirable in its kind, &c. Though strangers are prohibited to trade, yet a contraband commerce is carried on brisker here than at La Vera Cruz. Some little trade is carried on by other ports of Cuba, but it is very inconsiderable. As to the general commerce, this port is the place of rendezvous (as already mentioned) for all ships, particularly from Carthagena, Puerto Velo, and La Vera Cruz, which return to Spain from the Indies. The Havanna is regularly supplied with European goods only by the register ships from Cadiz and the Canaries. The flota and galleons bring there no more than the refuse of their cargoes, which they had not been able to dispose of at Carthagena, Puerto Velo, or La Vera Cruz. When the fleet is in the harbour, provisions are excessively dear on shore, and money so plenty, that a Spaniard expects half a piece of eight a day from a male slave, and a quarter from a female, out of what they earn for their labour. The fleet generally sails from thence, through the channel of Bahama, in the month of September; and is the richest in the world; since, in silver and merchandise, there is seldom less than thirty millions of pieces of eight on board, or six millions seven hundred and fifty thousand pounds of our money.—It is natural to imagine, that a port of so much consequence as the Havanna ought to be well fortified. Since it has been restored to Spain, many new works have been added, to prevent if possible a similar disaster befalling it. W. Long. 82. 13. N. Lat. 23. 12.

HAVEL, a river of Brandenburg, which proceeds from a lake in the duchy of Mecklenburg, and running thro' the middle Marche, and thro' Brandenburg and other towns, runs north, and falls into the Elbe.

HAVELBERG, a town of Germany, in the circle of Lower Saxony, and in the electorate of Brandenburg, with a bishop's see, secularized in favour of the house of Brandenburg. It is seated on the river Havel, in E. Long. 12. 43. N. Lat. 53. 4.

HAVEN, a sea-port or harbour for ships. See **PORT**.

Havanna
Haven.

Haver-
camp
Haum.

PORT and HARBOUR.—The word is derived from the Saxon *havene*, or the German *hafen*, or the French *havre*; which all signify the same thing.

HAVERCAMP (Sigibert), a celebrated Dutch scholar and critic, professor of history, eloquence, and the Greek tongue, at Leyden. He was particularly skilled in medals; and was the author of some esteemed works in that way, beside giving good and elegant editions of several Greek and Latin authors. He died at Leyden in 1742, aged 58.

HAVERFORD-WEST, a town of Pembrokeshire in South Wales, seated in W. Long. 5. N. Lat. 51. 50. It is a neat, well built, populous place, on the side of a hill, which forms a part of the west bank of the river Dongledye, 256 miles from London. It is an incorporated town and county of itself, governed by a mayor, sheriff, town-clerk, two bailiffs, serjeants at mace, and other officers. The mayor of the town is admiral, coroner, escheater, and clerk of the markets, within its precincts. The houses are well built and well inhabited, and the people enjoy a good trade. Here the assizes are held and the county-jail kept. The town enjoys several privileges, and has its own courts. There are three parish-churches within the town, and one in the suburbs. Here is also a commodious quay for ships of burden, a customhouse, and a fine stone-bridge over the Dongledye, with a good free-school, a charity-school for boys and girls, and an almshouse. It was formerly fortified with a rampart and castle, now demolished.

HAVERILL, a town of England, in the county of Suffolk, where there is a considerable manufactory of checks, cottons, and fustians. By the ruins of a church and castle still to be seen, it appears to have been formerly a place of much greater consequence than at present. It has now only about 300 poor clay-houses, and one wide street not paved.

HAUL, an expression peculiar to seamen, implying to pull a single rope, without the assistance of blocks or other such mechanical powers. When a rope is otherwise pulled, as by the application of tackles, or the connection with blocks, &c. the term is changed into *bowing*.

To *HAUL the Wind*, is to direct the ship's course nearer to that point of the compass from which the wind arises. Thus, supposing a ship to sail south-west, with the wind northerly, and some particular occasion requires to haul the wind more westward; to perform this operation, it is necessary to arrange the sails more obliquely with her keel; to brace the yards more forward, by slackening the starboard and pulling in the larboard braces, and to haul the lower sheets further aft; and, finally, to put the helm a-port, *i. e.* over to the larboard side of the vessel. As soon as her head is turned directly to the westward, and her sails are trimmed accordingly, she is said to have hauled the wind four points; that is to say, from south-west to west. She may still go two points nearer to the direction of the wind, by disposing her sails according to their greatest obliquity, or, in the sea-phrase, by *trimming all sharp*; and in this situation she is said to be close hauled, as sailing west-north-west.

HAUM, HALM, or *Harum*, among farmers, denotes the stem or stalk of corn, pease, beans, &c. from the root to the ear.

HAUNCH, or HANCH, the *Hip*, or that part of the body between the last ribs and the thigh.

The haunches of a horse are too long, if when standing in the stable he limps, with his hind-legs farther back than he ought; and when the top or onset of his tail is not in a perpendicular line to the tip of his hocks, as it always does in horses whose haunches are of a just length. There are some horses which though they have too long haunches, yet commonly walk well: such are good to climb hills, but are not at all sure upon a descent; for they cannot ply their hams, and never gallop slowly, but always nearly upon a full speed. The art of riding the great horse has not a more necessary lesson than that of putting a horse upon his haunches; which, in other words, is called *coupling him well*, or putting him well together, or compact. A horse that cannot bend or lower his haunches, throws himself too much upon his shoulder, and lies heavy upon the bridle.

HAVRE, in geography, &c. a French term signifying the same with haven or harbour.

HAVRE de Grace, a sea-port town of France, and capital of a district of the same name, is seated in the province of Normandy, on the English Channel, in a large plain at the mouth of the river Seine. It is a small fortified town, nearly of a square figure, divided into two parts by the harbour, surrounded with a wall and other works, and defended by a very strong citadel. It is one of the most important places in France, on account of its foreign trade and convenient harbour; for which reason it was made a distinct government from the rest of Normandy. It was surprised in 1562 by the Protestants, who delivered it to queen Elizabeth; but it was lost next year. In 1694 it was bombarded by the English, and also in the year 1758. E. Long. 0. 11. N. Lat. 49. 29.

HAURIANT, in heraldry, a term peculiar to fishes; and signifies their standing upright, as if they were refreshing themselves by sucking in the air.

HAUTE FEUILLE (John), an ingenious mechanic, born at Orleans in 1647. Though he embraced the state of an ecclesiastic, and enjoyed several benefices, he applied almost his whole life to mechanics, in which he made a great progress. He had a particular taste for clock work, and made several discoveries in it that were of singular use. It was he who found out the secret of moderating the vibration of the balance by means of a small steel-spring, which has since been made use of. This discovery he laid before the members of the Academy of Sciences in 1674; and these watches are, by way of eminence, called *pendulum-watches*; not that they have real pendulums, but because they nearly approach to the justness of pendulums. M. Huygens perfected this happy invention; but having declared himself the inventor, and obtained from Louis XIV. a patent for making watches with spiral springs, the abbé Feuille opposed the registering of this privilege, and published a piece on the subject against M. Huygens. He wrote a great number of other pieces, most of which are small pamphlets consisting of a few pages, but very curious; as, 1. His perpetual pendulum, quarto. 2. New inventions, quarto. 3. The art of breathing under water, and the means of preserving a flame shut up in a small place. 4. Reflections on machines for raising water. 5. His

Haunch
||
Haute.

Hautboy
||
Hawkers.

5. His opinion on the different sentiments of Mallebranche and Regis relating to the appearance of the moon when seen in the horizon. 6. The magnetic balance. 7. A placet to the king on the longitude. 8. Letter on the secret of the longitude. 9. A new system on the flux and reflux of the sea. 10. The means of making sensible experiments that prove the motion of the earth; and many other pieces. He died in 1724.

HAUTBOY, a musical instrument of the wind kind, shaped much like the lute; only that it spreads and widens towards the bottom, and is sounded through a reed. The treble is two feet long; the tenor goes a fifth lower when blown open: it has only eight holes; but the bass, which is five feet long, has eleven.

The word is French, *haut bois*, q. d. "high wood;" and is given to this instrument because the tone of it is higher than that of the violin.

HAW, a sort of berry, the fruit of several species of *mespilus*, thence denominated *hawthorns*. See *MESPILUS*.

HAW, among farriers, an excrescence resembling a gristle, growing under the nether eye-lid and eye of a horse, which, if not timely removed, will put it quite out. See *FARRIERY*, Sect. xv. 4.

HAW, a small parcel of land so called in Kent, as a *Hemphaw*, or *Beanhaw*, lying near the house, and inclosed for these uses. But Sir Edward Coke, in an ancient plea concerning Feverham in Kent, says *hawes* are houses.

Haw-Finch. See *LOXIA*.

HAWGH, or HOGGH, signifies a green plot in a valley as they use it in the north of England.

HAWK, in ornithology. See *FALCO*.

HAWKERS, anciently were fraudulent persons, who went from place to place buying and selling brass, pewter, and other merchandize, which ought to be uttered in open market. In this sense the word is mentioned *anno* 25 Hen. VIII. cap. 6. and 33 *ejusdem*, cap. 4. The appellation *hawkers* seems to have arisen from their uncertain wandering, like those who, with hawks, seek their game where they can find it.

The term is now used as synonymous with pedlar; a person who travels about the country selling wares. Every hawker must take out an annual licence, for which he must pay 4l. and if he travels with a horse, ass, or mule, for every one of them 8l. If he travels without a licence, or contrary to it, he forfeits for every offence to the informer, and the poor of the parish where discovered, 10l. The acts relating to hawkers do not extend to makers of goods or their agents; or to those who sell goods in fairs or markets; to the sellers of fish, fruit, or other victuals; nor to the venders of books and newspapers, 9 and 10 W. cap. 27. 3 and 4 Anne, cap. 4. But hawkers shall not, by virtue of such licence, sell or offer to sale any tea or spirituous liquors, though with a permit, under the penalty of having the same seized, and imprisonment and prosecution of the offender. 9 Geo. II. cap. 35. Hawkens who were licensed on June 23. 1785 may set up any business in the place where they are resident inhabitants, though not brought up thereto, and may employ therein persons who have not been apprentices.

HAWKERS is a term also applied to those who go up and down London streets and country towns, selling newspapers, pamphlets, &c.

HAWKESWORTH (John), a celebrated English writer, was born about the year 1719: though his epitaph, as we find it in the Gentleman's Magazine for Aug. 1781, makes him to have been born in 1715. He was brought up to a mechanical profession, that of a watchmaker as is supposed. He was of the Presbyterian persuasion, and a member of the celebrated Tom Bradbury's meeting, from which he was expelled for some irregularities. He afterwards devoted himself to literature, and became an author of considerable eminence. In the early part of life his circumstances were rather confined. He resided some time at Bromley in Kent, where his wife kept a boarding school. He afterwards became known to a lady who had great property and interest in the East India company, and through her means was chosen a director of that body. As an author, his *Adventurer* is his capital work; the merits of which, if we mistake not, procured him the degree of LL.D. from Herring archbishop of Canterbury. When the design of compiling a narrative of the discoveries in the South Seas was on foot, he was recommended as a proper person to be employed on the occasion: but in truth he was not a proper person, nor did the performance answer expectation. Works of taste and elegance, where imagination and the passions were to be affected, were his province; not works of dry, cold, accurate narrative. However, he executed his task, and is said to have received for it the enormous sum of 6000l. He died in 1773; some say of high living; others, of chagrin from the ill reception of his *Narrative*: for he was a man of the keenest sensibility, and obnoxious to all the evils of such irritable natures. On a handsome marble monument at Bromley in Kent is the following inscription, the latter part of which is taken from the last number of *The Adventurer*:

To the memory of
JOHN HAWKESWORTH, LL. D.

Who died the 16th of November

MDCCLXXIII, aged 58 years.

That he lived ornamental and useful

To society in an eminent degree

Was among the boasted felicities

Of the present age;

That he laboured for the benefit of society,

Let his own pathetic admonitions

Record and realize.

"The hour is hastening, in which whatever praise

"or censure I have acquired will be remembered

"with equal indifference. Time, who is impatient

"to date my last paper, will shortly moulder the

"hand which is now writing it in the dust, and still

"the breast that now throbs at the reflection. But

"let not this be read as something that relates

"only to another; for a few years only can divide

"the eye that is now reading from the hand that

"has written."

HAWKING, the exercise of taking wild-fowl by means of hawks. The method of reclaiming, manning, and bringing up a hawk to this exercise, is called *falconry*. See *FALCONRY*.

There

Hawkens
||
Hawking.

Hawking.

There are only two countries in the world where we have any evidence that the exercise of hawking was very anciently in vogue. These are, Thrace and Britain. In the former, it was pursued merely as the diversion of a particular district, if we may believe Pliny*, whose account is rendered obscure by the darkness of his own ideas of the matter. The primæval Britons, with a fondness for the exercise of hunting, had also a taste for that of hawking; and every chief among them maintained a considerable number of birds for that sport. It appears also from a curious passage in the poems of Ossian†, that the same diversion was fashionable at a very early period in Scotland. The poet tells us, that a peace was endeavoured to be gained by the proffer of 100 managed steeds, 100 foreign captives, and "100 hawks with fluttering wings, that fly across the sky." To the Romans this diversion was scarce known in the days of Vespasian; yet it was introduced immediately afterwards. Most probably they adopted it from the Britons; but we certainly know that they greatly improved it by the introduction of spaniels into the island. In this state it appears among the Roman Britons in the sixth century. Gildas, in a remarkable passage in his first epistle, speaks of Maglocunus, on his relinquishing the sphere of ambition, and taking refuge in a monastery; and proverbially compares him to a dove, that hastens away at the noisy approach of the dogs, and with various turns and windings takes her flight from the talons of the hawk.

In after times, hawking was the principal amusement of the English: a person of rank scarce stirred out without his hawk on his hand; which, in old paintings, is the criterion of nobility. Harold, afterwards king of England, when he went on a most important embassy into Normandy, is painted embarking with a bird on his fist, and a dog under his arm: and in an ancient picture of the nuptials of Henry VI. a nobleman is represented in much the same manner; for in those days, it was thought sufficient for noblemen to *windle their horn, and to carry their hawk fair, and leave study and learning to the children of mean people*. The former were the accomplishments of the times; Spenser makes his gallant Sir Tristram boast,

Ne is there hawk which mantleth her on perch,
Whether high towring, or accoasting low,
But I the measure of her flight doe search,
And all her prey, and all her diet know. B. vi. Canto 2.

In short, this diversion was, among the old English, the pride of the rich, and the privilege of the poor; no rank of men seems to have been excluded the amusement: we learn from the book of St Alban's, that every degree had its peculiar hawk, from the emperor down to the *holy-water clerk*. Vast was the expence that sometimes attended this sport. In the reign of James I. Sir Thomas Monson is said to have given 1000l. for a cast of hawks: we are not then to wonder at the rigour of the laws that tended to preserve a pleasure that was carried to such an extravagant pitch. In the 34th of Edward III. it was made felony to steal a hawk; to take its eggs, even in a person's own ground, was punishable with imprisonment for a year and a day, besides a fine at the king's pleasure: in queen Elizabeth's reign, the imprisonment was reduced to three months; but the offender was to

find security for his good behaviour for seven years, or lie in prison till he did. Such was the enviable state of the times of old England; during the whole day, the gentry were given to the fowls of the air and the beasts of the field; in the evening, they celebrated their exploits with the most abandoned and brutish sottishness; at the same time, the inferior rank of people, by the most unjust and arbitrary laws, were liable to capital punishments, to fines, and loss of liberty, for destroying the most noxious of the feathered tribe.

According to Olearius, the diversion of hawking is more followed by the Tartars and Persians than ever it was in any part of Europe. *Il n'y avoit point de butte* (says he) *qui n'eust son aigle ou son faucon*.

The falcons or hawks that were in use in these kingdoms, are now found to breed in Wales, and in North Britain and its isles. The peregrine falcon inhabits the rocks of Caernarvonshire. The same species, with the gyrfalcon, the gentil, and the goshawk, are found in Scotland, and the lanner in Ireland.

We may here take notice, that the Norwegian breed was, in old times, in high esteem in England: they were thought bribes worthy a king. Jeoffrey Fitz-pierre gave two good Norway hawks to king John, to obtain for his friend the liberty of exporting 100 wt. of cheese; and Nicholas the Dane was to give the king a hawk every time he came into England, that he might have free liberty to traffic throughout the king's dominions.

They were also made the tenures that some of the nobility held their estates by, from the crown. Thus Sir John Stanley had a grant of the Isle of Man from Henry IV. to be held of the king, his heirs, and successors, by homage and the service of two falcons, payable on the day of his or their coronation. And Philip de Hastang held his manor of Combertoun in Cambridgeshire, by the service of keeping the king's falcons.

Hawking, though an exercise now much disused among us, in comparison of what it anciently was, does yet furnish a great variety of significant terms, which still obtain in our language. Thus, the parts of a hawk have their proper names.—The legs, from the thigh to the foot, are called *arms*; the toes, the *petty singles*; the claws, the *pounces*.—The wings are called the *sails*; the long feathers thereof, the *beams*; the two longest, the *principal feathers*; those next thereto, the *flags*.—The tail is called the *train*; the breast-feathers, the *mails*; those behind the thigh, the *pendant feathers*.—When the feathers are not yet full grown, she is said to be *unsummed*; when they are complete, she is *summed*:—The craw, or crop, is called the *gorge*:—The pipe next the fundament, where the faeces are drawn down, is called the *pannel*:—The slimy substance lying in the pannel, is called the *glut*:—The upper and crooked part of the bill is called the *beak*; the nether-part, the *clap*; the yellow part between the beak and the eyes, the *fear* or *fere*; the two small holes therein, the *nares*.

As to her furniture:—The leathers, with bells buttoned on her legs, are called *beawits*.—The leathern thong, whereby the falconer holds the hawk, is called the *lease* or *leash*; the little straps, by which the lease is fastened to the legs, *jeffes*; and a line or pack-thread fastened to the lease, in disciplining her, a *creance*.—

Hawking.

Hawking. A cover for her head, to keep her in the dark, is called a *hood*; a large wide hood, open behind, to be wore at first, is called a *ruster hood*: To draw the strings, that the hood may be in readiness to be pulled off, is called *unstriking the hood*.—The blinding a hawk just taken, by running a thread through her eye lids, and thus drawing them over the eyes, to prepare her for being hooded, is called *feeling*.—A figure or resemblance of a fowl, made of leather and feathers, is called a *lure*.—Her resting-place, when off the falconer's fist, is called the *perch*.—The place where her meat is laid, is called the *back*; and that wherein she is set, while her feathers fall and come again, the *mew*.

Something given a hawk, to cleanse and purge her gorge, is called *casting*.—Small feathers given her to make her cast, are called *plumage*:—Gravel given her to help to bring down her stomach, is called *rangle*: Her throwing up filth from the gorge after casting, is called *gleaming*.—The purging of her grease, &c. *enseaming*.—A being stuffed is called *gurgiting*.—The inserting a feather in her wing, in lieu of a broken one, is called *imping*.—The giving her a leg, wing, or pinion of a fowl to pull at, is called *tiring*:—The neck of a bird the hawk preys on, is called the *inke*:—What the hawk leaves of her prey, is called the *pill* or *pelf*.

There are also proper terms for her several actions. —When she flutters with her wings, as if striving to get away, either from perch or fist, she is said to *bate*. —When standing too near they fight with each other, it is called *crabbing*:—When the young ones quiver, and shake their wings in obedience to the elder, it is called *covring*:—When she wipes her beak after feeding, she is said to *feak*:—When she sleeps, she is said to *jouk*:—From the time of exchanging her coat, till she turn white again, is called her *intermewing*:—Treading is called *carwking*: When she stretches one of her wings after her legs, and then the other, it is called *mantling*:—Her dung is called *matting*; when she mutes a good way from her, she is said to *slice*; when she does it directly down, instead of yerking backwards, she is said to *slime*; and if it be in drops, it is called *dropping*.—When she as it were sneezes, it is called *sniting*.—When she raises and shakes herself, she is said to *rouze*:—When, after mantling, she crosses her wings together over her back, she is said to *warble*.

When a hawk seizes, she is said to *kind*:—When, after seizing, she pulls off the feathers, she is said to *plume*.—When she raises a fowl aloft, and at length descends with it to the ground, it is called *trussing*.—When, being aloft, she descends to strike her prey, it is called *stooping*.—When she flies out too far from the game, she is said to *rake*.—When, forsaking her proper game, she flies at pyes, crows, &c. that chance to cross her, it is called *check*.—When, missing the fowl, she betakes herself to the next check, she is said to *fly on head*.—The fowl or game she flies at is called the *quarry*.—The dead body of a fowl killed by the hawk, is called a *pelt*.—When she flies away with the quarry, she is said to *carry*.—When in stooping she turns two or three times on the wing, to recover herself ere she seizes, it is called *canceliering*.—When she hits the prey, yet does not truss it, it is called *ruff*.—The making a hawk tame and gentle, is called *reclaiming*.—The bringing her to endure company, *manning* her.

—An old staunch hawk, used to fly and set example to a young one, is called a *make-hawk*.

The reclaiming, manning, and bringing up a hawk to the sport, is not easy to be brought to any precise set of rules.—It consists in a number of little practices and observances, calculated to familiarize the falconer to his bird, to procure the love thereof, &c. See the article *FALCONRY*.

When your hawk comes readily to the lure, a large pair of luring-bells are to be put upon her; and the more giddy-headed and apt to rake out your hawk is, the larger must the bells be. Having done this, and she being sharp-set, ride out in a fair morning, into some large field unencumbered with trees or wood, with your hawk on your fist; then having loosened her hood, whistle softly, to provoke her to fly; unhood her, and let her fly with her head into the wind; for by that means she will be the better able to get upon the wing, and will naturally climb upwards, flying a circle. After she has flown three or four turns, then lure her with your voice, casting the lure about your head, having first tied a pullet to it; and if your falcon come in and approach near you, cast out the lure into the wind, and if she stoop to it reward her.

You will often find, that when she flies from the fist, she will take stand on the ground: this is a fault which is very common with soar-falcons. To remedy this, fright her up with your wand; and when you have forced her to take a turn or two, take her down to the lure, and feed her. But if this does not do, then you must have in readiness a duck sealed, so that she may see no way but backwards, and that will make her mount the higher. Hold this duck in your hand, by one of the wings near the body; then lure with the voice, to make the falcon turn her head; and when she is at a reasonable pitch, cast your duck up just under her; when, if she strike, stoop, or truss the duck, permit her to kill it, and reward her by giving her a reasonable gorge. After you have practised this two or three times, your hawk will leave the stand, and, delighted to be on the wing, will be very obedient.

It is not convenient, for the first or second time, to show your hawk a large fowl; for it frequently happens, that they escape from the hawk, and she, not recovering them, rakes after them: this gives the falconer trouble, and frequently occasions the loss of the hawk. But if she happens to pursue a fowl, and being unable to recover it, gives it over, and comes in again directly, then cast out a sealed duck; and if she stoop and truss it across the wings, permit her to take her pleasure, rewarding her also with the heart, brains, tongue, and liver. But if you have not a quick duck, take her down with a dry lure, and let her plume a pullet and feed upon it. By this means a hawk will learn to give over a fowl that rakes out, and on hearing the falconer's lure, will make back again, and know the better how to hold in the head.

Some hawks have a disdainful coyness, proceeding from their being high fed: such a hawk must not be rewarded though she should kill: but you may give her leave to plume a little; and then taking a sheep's heart cold, or the leg of a pullet, when the hawk is busy in pluming, let either of them be conveyed into the body of the fowl, that it may savour of it; and

Hawkwood when the hawk has eaten the heart, brains, and tongue of the fowl, take out what is inclosed, call her to your fist, and feed her with it: afterwards give her some of the feathers of the fowl's neck, to scower her, and make her cast.

If your hawk be a stately high-flying one, she ought not to take more than one flight in a morning; and if she be made for the river, let her not fly more than twice: when she is at the highest, take her down with your lure; and when she has plumed and broken the fowl a little, feed her, by which means you will keep her a high-flyer, and fond of the lure.

HAWKWOOD (Sir John), a famous English general, was the son of a tanner at Heddingham-Sibil in Essex, where he was born in the reign of Edward III. He was bound apprentice to a taylor in London; but being fortunately pressed into the army, was sent abroad, where his genius soon expanded itself, and surmounted the narrow prejudices which adhered to his birth and occupation. He signalized himself as a soldier in France and Italy, and particularly at Pisa and Florence. He commanded with great ability and success in the army of Galeacius duke of Milan; and was in such high esteem with Barnabas his brother, that he gave him Domitia his natural daughter in marriage, with an ample fortune. He died at Florence, full of years and military fame, in 1394.

HAWSE, or **HAUSE**, is generally understood to imply the situation of the cables before the ship's stem, when she is moored with two anchors out from forward, viz. one on the starboard, and the other on the larboard bow. Hence it is usual to say, *she has a clear hawse*, or *a foul hawse*. It also denotes any small distance a head of a ship, or between her head and the anchors employed to ride her, as, "He has anchored in our hawse, The brig fell athwart our hawse," &c.

A ship is said to ride with a clear hawse, when the cables are directed to their anchors, without lying athwart the stem; or crossing, or being twisted round each other by the ship's winding about, according to the change of the wind, tide, or current.

A foul hawse, on the contrary, implies that the cables lie across the stem, or bear upon each other, so as to be rubbed and chafed by the motion of the vessel. The hawse accordingly is foul, by having either a cross, an elbow, or a round turn. If the larboard cable, lying across the stem, points out on the starboard side, while the starboard cable at the same time grows out on the larboard side, there is a cross in the hawse. If, after this, the ship, without returning to her former position, continues to wind about the same way, so as to perform an entire revolution, each of the cables will be twisted round the other, and then directed out from the opposite bow, forming what is called a round turn. An elbow is produced when the ship stops in the middle of that revolution, after having had a cross: or, in other words, if she rides with her head northward with a clear hawse, and afterwards turns quite round so as to direct her head northward again, she will have an elbow.

HAWSE-Holes, certain cylindrical holes cut through the bows of a ship on each side of the stem, through which the cables pass in order to be drawn into or let

out of the vessel as occasion requires. They are fortified on each side by the

HAWSE-Pieces, a name given to the foremost timbers of a ship, whose lower ends rest on the knuckle-timber, or the foremost of the cant-timbers. They are generally parallel to the stem, having their upper ends sometimes terminated by the lower part of the beak-head; and otherwise, by the top of the bow, particularly in small ships and merchantmen.

HAWSER, a large rope which holds the middle degree between the *cable* and *tow-line*, in any ship whereto it belongs, being a size smaller than the former, and as much larger than the latter.

HAY, any kind of grass cut and dried for the food of cattle.

The time of mowing grass for hay must be regulated according to its growth and ripeness; nothing being more prejudicial to the crop than mowing it too soon; because the sap is not then fully come out of the root, and when made into hay, the grass shrinks away to nothing. It must not, however, be let stand too long till it have shed its seeds. When the tops of the grass look brown, and begin to bend down, and the red honeysuckle flowers begin to wither, you may conclude it ripe for mowing.

Sain-Foin Hay, is of several sorts, which may be distinguished by the following terms, viz. 1. The virgin. 2. The blossomed. 3. The full-grown. And, 4. The threshed hay. The first of these is beyond comparison the best. It must be cut before the blossoms generally appear; for when it stands till it is full blown, the most spirituous and nourishing parts of its juice are spent, the sap is much impoverished, and the sain-foin can never recover that richness it had in its virgin state. But this fine hay cannot well be had of uncultivated sain-foin, because that may not be much above an handful high when it is in a condition to be cut; it would then make a very light crop, and would be a great while before it sprang up again: but the rich will have two or three tuns to an acre, and spring again immediately for a second crop; so that little or none in quantity would be lost by so great an improvement of its quality.

The second sort is that cut in the flower, which, though much inferior to the virgin-hay, far exceeds any other kind as yet commonly propagated in Britain; and if it be a full crop, it may amount to three tuns an acre. This is that sain-foin which is commonly made; and the larger it is, the more nourishing it is for horses.

The next sort of sain-foin is the full grown, cut when the blossoms are gone or going off: this also is good hay, though it falls short by many degrees of the goodness of the other two sorts; but it makes a greater crop than either of them, because it grows to its full bulk, and shrinks little in drying.

The last sort is the threshed hay; which, when not damaged by wet weather, has been found more nourishing to horses than coarse water-meadow hay: and, when it is cut small by an engine, is good for cattle, and much better than the chaff of corn. The best time to cut it, is when the greatest part of the seed is well filled; the first-blown ripe, and the last-blown beginning to be full.

The goodness of the hay depends greatly upon the manner

Hawse
Hay.

Hay.

manner of ordering it. The best hay in all England is made of sain-foin, without ever spreading it. This method, though it be longer before it be finished, costs less labour than the other. If sain-foin be laid up pretty green, it will take no damage, provided it be set in small round ricks, with a large basket drawn up in the middle of each, to have a vent-hole, through which the superfluous moisture of the hay may transpire. As soon as its heating is over, these ricks ought to be thatched; and all sain-foin ricks, that are made when the hay is full dried in the cocks, ought to be thatched immediately after the making them. That which is laid up moist dried, will come out of the rick of a green colour; but that which has been much heated in the rick, will be brown.

The seed affords the owner another opportunity of making a profit of his sain-foin: but this, if the hoeing husbandry were general, would not be vendible in great quantities for planting; because the ordinary crop of an acre will produce seed enough to drill an hundred acres, which would not want planting for a long time. The other use then of this seed is for provender; and it has been affirmed by some who have made trials of it, that three bushels of good sain-foin seed given to horses, will nourish them as much as four bushels of oats; and when well ordered, it is so sweet, that most sorts of cattle are greedy of it.

Har-Making. See AGRICULTURE, n^o 199, *et seq.*

HAY, a town of Brecknockshire, in Wales, seated near the confluence of the rivers Wye and Dulas. It was a town of good note in the time of the Romans; it being then fortified with a castle and a wall, which were ruined in the rebellion of Owen Glendower. It is at present a pretty good town; and the market is large for corn, cattle, and provisions. W. Long. o. 56. N. Lat. 52. 10.

HAY (William, Esq;), an agreeable English writer, was born at Glenburne in Suffex, about 1700, as is conjectured; and educated at Headley-school. In 1730, he published a poem, called *Mount Caburn*, dedicated to the duchess of Newcastle; in which he describes the beauties of his native country, and celebrates the virtues of his friends. When lord Hardwicke was called up to the house of lords in 1734, he was chosen to succeed him in representing the borough of Seaford among the commons: and he represented this borough for the remainder of his life. He defended the measures of Sir Robert Walpole, and was the supposed author of a ministerial pamphlet, intitled, *A Letter to a Freeholder on the late Reduction of the Land-tax to one Shilling in the Pound*; which had been printed in 1732. In 1735, he published *Remarks on the Laws relative to the Poor, with Proposals for their better Relief and Employment*; and at the same time brought in a bill for the purpose. He made another attempt of this kind, but without effect. May 1738, he was appointed a commissioner of the Victualling-office. In 1753, appeared *Religio Philosophi*; or, the Principles of Morality and Christianity, illustrated from a View of the Universe, and of Man's Situation in it. This was followed, in 1754, by his *Essay on Deformity*; in which he rallies his own imperfection in this respect with much liveliness and good humour. "Bodily deformity (says he), is very rare. Among 558 gentle-

men in the House of Commons, I am the only one that is so. Thanks to my worthy constituents, who never objected to my person, and I hope never to give them cause to object to my behaviour." The same year, he translated Hawkins Browne *De Immortalitate Animi*. In 1755, he translated and modernized some Epigrams of Martial; but survived this publication only a short time, dying June 19. the same year. A little time before, he had been appointed keeper of the Records in the Tower; and it is said that his attention and assiduity during the few months he held that office were eminently serviceable to his successors.—He left a son, who inherited the imperfect form of his father. This gentleman went into the service of the East India company, where he acquired rank, fortune, and reputation; but being one of those who opposed Cossim Ally Kawn, and unfortunately falling into his hands, was, with other gentlemen, ordered to be put to death at Patna, Oct. 5. 1763.

HAYES (Charles, Esq;), a very singular person, whose great erudition was so concealed by his modesty, that his name is known to very few, though his publications are many. He was born in 1678, and became distinguished in 1704 by *A Treatise of Fluxions*, folio: the only work to which he ever set his name. In 1710, came out a small 4to pamphlet of 19 pages, intitled, *A new and easy Method to find out the Longitude, from observing the Altitudes of the Celestial Bodies*: and, in 1723, *The Moon, a Philosophical Dialogue*; tending to show, that the moon is not an opaque body, but has original light of her own. During a long course of years, the management of the late Royal African company lay in a manner wholly upon Mr Hayes, he being annually either sub-governor or deputy-governor; notwithstanding which, he continued his pursuit after general knowledge. To a skill in the Greek and Latin as well as modern languages, he added the knowledge of the Hebrew; and published several pieces, relating to the translation and chronology of the scriptures. The African company being dissolved in 1752, he retired to Down in Kent, where he gave himself up to study. May 1753, he began to compile in Latin his *Chronographia Asiatica & Ægyptiaca*, which he lived to finish, but not to publish; which, however, was published afterwards. August 1758, he left his house in Kent, and took chambers in Gray-Inn, where he died, December 18. 1760, in his 82d year. The title of his posthumous works runs thus: *Chronographia Asiatica & Ægyptiaca Specimen*; in quo, 1. *Origo Chronologiae LXX Interpretum investigatur.* 2. *Conspectus totius operis exhibetur*, 8vo.

HAYNAULT. See HAINAULT.

HAYS, particular nets for taking rabbits, hares, &c. common to be bought in shops that sell nets, and they may be had larger or shorter as you think fit; from 15 to 20 fathoms is a good length, and for depth a fathom.

As rabbits often straggle abroad about mid-day for fresh grass, where you perceive a number gone forth to any remote brakes or thickets, pitch two or three of these hays about their burrows; lie close there: but in case you have not nets enough to inclose all their burrows, some may be stopped up with stones, &c. Then set out with the coney-dog to hunt up and down at a good

Hayes

Hays.

Hayward
||
Hazole.

good distance, and draw on by degrees to the man who is with you, and lies close by the hay, who may take them as they bolt into it.

HAYWARD, the person who keeps the common herd or cattle of a town. He is appointed by the lord's court; and his office is to see that the cattle neither break nor crop the hedges of inclosed grounds.

HAYWARD (Sir John), an eminent English historian and biographer in the beginning of the 17th century, was educated in the university of Cambridge, where he took the degree of doctor of laws. In 1610, he was appointed one of the historiographers of a college then at Chelsea; and, in 1619, received the honour of knighthood. He wrote, 1. The lives of the three Norman kings of England, William I. and II. and Henry I. 2. The first part of the life and reign of king Henry IV. 3. The life and reign of king Edward VI.; and several theological works. He died in 1627.

HAZAEEL, an officer belonging to Benhadad king of Syria, caused that prince to be put to death, and reigned in his stead. He defeated Joram, Jehu, and Jehoahaz, kings of Israel; and, after his death, was succeeded by Benhadad his son, 852 B. C.

HAZARD, or **CHANCE**, in gaming. See **GAMING**.

HAZARD, a game on dice, without tables, is very properly so called; since it speedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can stand round the largest round table.

Two things are chiefly to be observed, viz. main and chance; the latter belonging to the castor, and the former, or main, to the other gamesters. There can be no main thrown above nine, nor under five; so that five, six, seven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, six to seven, seven to six, eight to five; and nine and ten a chance to five, six, seven, and eight: in short, four, five, six, seven, eight, nine, and ten, are chances to any main, if any of these nick it not. Now nicks are either when the chance is the same with the main, as five and five, or the like; or six and twelve, seven and eleven, eight and twelve. Here observe, that twelve is out to nine, seven, and five; eleven is out to nine, eight, six, and five: and ames-ace and duce-ace, are out to all mains whatever.

HAZLE, or **HAZEL**, in botany. See **CORYLUS**.

The kernels of the fruit have a mild, farinaceous, oily taste, agreeable to most palates. Squirrels and mice are fond of them, as well as some birds, such as jays, nutcrackers, &c. A kind of chocolate has been prepared from them, and there are instances of their having been formed into bread. The oil expressed from them is little inferior to the oil of almonds; and is used by painters and by chemists for receiving and retaining odours. The charcoal made of the wood is used by painters in drawing.—Some of the Highlanders, where superstition is not totally subsided, look upon the tree itself as unlucky; but are glad to get two of the nuts naturally conjoined, which is a good omen. These they call *cno-chomblaich*, and carry them as an efficacious charm against witchcraft.

Evelyn tells us, that no plant is more proper for

thickening of copses than the hazle, for which he directs the following expeditious method. Take a pole of hazle (ash or poplar may also be used) of 20 or 30 feet in length, the head a little lopped into the ground, giving it a chop near the ground to make it succumb; this fastened to the earth with a hook or two, and covered with some fresh mould at a competent depth (as gardeners lay their carnations), will produce a great number of suckers, and thicken and furnish a copse speedily.

HAZLE-Earth, or **Hazley-Earth**, a kind of red loam, which is said to be an excellent mixture with other sorts of earth; uniting what is too loose, cooling what is too hot, and gently retaining the moisture.

Witch-HAZEL. See **HAMAMALIS**.

HEAD, the uppermost or foremost part of the body of an animal. See **ANATOMY**, Part I. sect. ii.

HEAD-Ach, a most troublesome sensation in the head, produced by various causes, and attended with different symptoms, according to its different degrees and the place where it is seated. See (the *Index* subjoined to) **MEDICINE**.

Dragon's HEAD, in astronomy, is the ascending node of the moon or other planet.

HEAD of a Ship, an ornamental figure erected on the continuation of a ship's stem, as being expressive of her name, and emblematical of war, navigation, commerce, &c.

HEAD, is also used in a more enlarged sense to signify the whole front or forepart of the ship, including the bows on each side: the head therefore opens the column of water through which the ship passes when advancing. Hence we say, head-sails, head-sea, head-way, &c.

Thus, fig. 1. Plate CCXXVI. represents one side of the fore-part or head of a 74 gunship, together with part of the bow, keel, and gunnel. The names of the several pieces, exhibited therein, are as follow:

AA Fore-part of the keel, with *aa* the two false keels beneath it.

AC the stem.

a a The cat-head.

bb The supporter of the cat-head.

cc The knight-head, or bollard-timber, of which there is one on each side, to secure the inner end of the bowsprit.

dd The haufe-holes.

ee The naval-hoods, *i. e.* thick pieces of plank laid upon the bow to strengthen the edges of the haufe-holes.

f The davit-chock, by which the davit is firmly wedged while employed to fish the anchor.

g The bulk-head, which terminates the forecastle on the fore-side, being called the *beak-head bulk-head* by shipwrights,

H The gun-ports of the lower deck.

b The gun-ports of the upper deck and forecastle.

I, I, The channels, with their dead-eyes and chain-plates.

i The gripe, or fore-foot, which unites the keel with the stem, forming a part of either.

kk These dotted lines represent the thickness and descent of the different decks from the fore-part of the ship towards the middle. The lowest of the three dotted

Hazle
||
Head.

Head.

ted lines / expresses the convexity of the beams, or the difference between the height of the deck in the middle of its breadth and at the ship's side. This is also exhibited more clearly in the *MIDSHIP-Frame*; where the red curve of the beam is delineated. N. B. These lines must be always parallel to the lines which terminate the gun-ports above and below.

mm The timbers of the head, and part of the bowsprit.

X The rails of the head which lie across the timbers.

QZ Fore-part of the main-wale.

R X Fore-part of the channel-wale.

UC The load water-line.

Fig. 2. represents a head-view of a ship, with the projection of her principal timbers, and all her planks laid on one side.

It is evident that the fore-part of a ship is called its *head*, from the affinity of motion and position it bears to a fish, and in general to the horizontal situation of all animals whilst swimming.

By the *HEAD*; the state of a ship, which is laden deeper at the fore-end than the after-end.

HEAD-Borow, or *HEAD-Borough*, signifies the person who is the chief of the frank-pledge, and had anciently the principal direction of those within his own pledge. He was also called *burrow-head*, *burshoulder*, now *borsholder*, *third-borow*, *tything-man*, *chief-pledge*, and *borow-elder*, according to the diversity of speech in different places. This office is now usually called a *high-constable*. The head-borow was the chief of ten pledges: the other nine were called *hand-borows*, or *plegii manuales*, &c.

HEAD-Mould-shot, a disease in children, wherein the sutures of the skull, generally the coronal, *ride*; that is, have their edges shot over one another; and are so close locked together, as to compress the internal parts, the meninges, or even the brain itself. The disease usually occasions convulsions, and is supposed to admit of no cure from medicine, unless room could be given by manual operation or a divulsion of the sutures.

The head-mould-shot is the disorder opposite to the horse-shoe head.

HEAD-Pence, an exaction of a certain sum formerly collected by the sheriff of Northumberland from the inhabitants of that county, without any account to be made to the king. This was abolished by the statute 23 Hen. VI. cap. 7.

HEAD-Tin, in metallurgy, is a preparation of tin-ore toward the fitting it for working into metal. When the ore has been pounded and twice washed, that part of it which lies uppermost, or makes the surface of the mass in the tub, is called the *head-tin*; this is separated from the rest, and after a little more washing becomes fit for the blowing-house.

HEAD-Fast, a rope employed to fasten a ship to a wharf, chain, or buoy, or to some other vessel alongside.

HEAD-Land, a name frequently given to a cape or promontory.

HEAD-Dress, amongst the Jewish, Grecian, and Roman ladies, as among ourselves, was various, according to the different periods of time, and the fluctuation of fashion. In general, it principally consisted of their hair differently tricked out. It was usually divided

before, with a bodkin, into two equal parts; sometimes it was covered with a net, or put into a kind of purse, or tied behind in the form of a knot, or bound back and plaited with ribbands. It was washed with great care; essence and perfumes were applied to it, and gold-dust sometimes made use of as powder. Pearls and jewels made a part of their ornaments; and pendants were worn in the ear. To cover the defect of hair, perukes were made use of by the gentlemen of Rome. And we read that Otho had a covering of false hair, because he had not much of his own. See *HAIR*, *JEWELS*.

Both Grecian and Roman ladies wore *têtes*. But whether they ever built up their heads so high as the English, or our continental neighbours, will admit of a dispute.

HEADMOST, the situation of any ship or ships which are the most advanced in a fleet, or line of battle.

HEAD-Rope, that part of the bolt-rope which terminates any of the principal sails on the upper edge, which is accordingly sewed thereto. See the article *BOLT-ROPE*.

HEAD-Sails, a general name for all those sails which are extended on the fore-mast and bowsprit, and employed to command the fore-part of the ship: such are the fore-sail, fore-top-sail, fore-top-gallant-sail, jib, fore-stay-sail, and the sprit-sail with its top-sail. This term is used in opposition to *after-sails*, viz. all those which are extended on the mizen-mast, and on the stays between the mizen and main masts.

HEAD-to-wind; the situation of a ship or boat, when her head is turned to windward.

HEAD-Way, the motion of advancing at sea. It is generally used when a ship first begins to advance; or when it is doubtful whether she is in a state of rest or motion. It is in both senses opposed to retreating, or moving with the stern foremost. See the article *STERN-WAY*.

HEALFANG, *HEALSFANG*, or *HALSFANG*, in our ancient customs, signifies *collisfrigium*, or the punishment of the pillory. The word is compounded of two Saxon words; *halp*, neck, and *pangen* "to contain:" *Pena scilicet qua alicui collum stringatur*. The heal-fang, however, cannot signify a pillory in the charter of Canutus, De Forestis, cap. xiv. *Et pro culpa solvat regi duos solidos, quos Dani vocant halfefang*.

HEALFANG is also taken for a pecuniary punishment or mulct, to commute for standing in the pillory; and is to be paid either to the king or the chief lord. *Qui falsum testimonium dedit, reddat regi vel terre domino heal-fang*.

HEALING, in its general sense, includes the whole process of curing or removing a disorder, and recovering health. In this sense medicine is defined the art of healing. In its more restrained sense, as used in surgery, &c. healing denotes the uniting or consolidating the lips of a wound or ulcer. The medicines proper for this intention are called *incarnatives*, *agglutinatives*, *vulneraries*, &c.

HEALING, in architecture, denotes the covering the roof of a building. The healing is various; as of lead, tiles, slate, Horshamstone, shingles, or reed and straw.

HEALTH, is a right disposition of the body, and of

Health
||
Heart.

of all its parts; consisting in a due temperature, a right conformation, just connection, and ready and free exercise of the several vital functions.

Health admits of latitude, as not being the same in all subjects, who may yet be said to enjoy health.

That part of medicine which shows the means of preserving health, is termed *hygiene*. See MEDICINE.

The Greeks and Romans deified Health, representing it under the figure of a woman, whom they supposed to be the daughter of Æsculapius. We find the name of the goddess *Salus*, or Health, on many medals of the Roman emperors, with different inscriptions; as, *SALUS PUBLICA*, *SALUS REIPUBLICÆ*, *SALUS AUGUSTI*, &c.

Methods of preserving the HEALTH of Mariners. See MARINER.

HEAM, in beasts, denotes the same with *after birth* in women. Thyme, penny-royal, winter-savory, and common hore-hound, boiled in white-wine, and given to a mare, are esteemed good to expel the heam. Dittany, applied in a pessary, expels the heam, as well as the dead foal; so also do fennel, hops, favin, angelica, &c.

HEARING, the act or faculty of perceiving sounds. Hearing is reckoned among our external senses. Its organ is the ear, and particularly the auditory nerve diffused through the same; and its object, certain motions or vibrations of the air. Hence hearing may be more scientifically defined, a sensation, whereby, from a due motion impressed on the fibrillæ of the auditory nerve, and communicated thence to the sensory, the mind perceives and gets the idea of sounds. See ANATOMY, n° 141.

HEARING in different animals. See COMPARATIVE-ANATOMY, ENTOMOLOGY, and ICHTHYOLOGY.

HEARNE (Thomas), a celebrated antiquarian, eminent for his writings and editions of MSS. His father was parish-clerk of Little Waltham in Berkshire, where he was born in 1680. He had a liberal education by the patronage of a neighbouring gentleman; and even from a boy discovered a strong propensity to the study of antiquities. He did great services to the Bodleian library, and died in 1735.

HEARSE, among hunters, a hind in the second year of her age. See HUNTING.

HEARSE is the name of a well-known carriage, used for conveying the dead to the grave. The word is also used by Shakespeare in his Henry VI. for a monument erected over a grave.

HEART, in anatomy, a musculous part of the animal body, situated in the thorax, on the anterior part of the diaphragm, between the two laminæ of the mediastinum, wherein the veins all terminate, and from which all the arteries arise; and which, by its alternate contraction and dilatation, is the chief instrument of the

circulation of the blood, and the principle of life. See ANATOMY, n° 121, 122.

Heart.

Several ingenious persons have from time to time attempted to make estimates of the force of the blood in the heart and arteries; who have as widely differed from each other, as they have from the truth, for want of a sufficient number of data to argue upon. This set the truly ingenious Dr Hales upon making proper experiments, in order to ascertain the force of the blood in the veins and arteries of several animals.

If, according to Dr Keil's estimate, the left ventricle of a man's heart throws out in each systole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be = 0.4187, then dividing the former by this, the quotient 3.9 is the length of the cylinder of blood which is formed in passing thro' the aorta in each systole of the ventricle; and in the 75 pulses of a minute, a cylinder of 292.5 inches in length will pass: this is at the rate of 1462 feet in an hour. But the systole of the heart being performed in one third of this time, the velocity of the blood in that instant will be thrice as much, viz. at the rate of 4386 feet in an hour, or 73 feet in a minute. And if the ventricle throws out one ounce in a pulse, then in the 75 pulses of a minute, the quantity of blood will be equal to 4.4lb. 11 oz. and, in 34 minutes, a quantity equal to a middle-sized man, viz. 158 lb. will pass through the heart. But if, with Dr Harvey and Dr Lower, we suppose two ounces of blood, that is, 3.276 cubic inches, to be thrown out at each systole of the ventricle, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, viz. 17 minutes.

If we suppose, what is probable, that the blood will rise $7\frac{1}{2}$ feet high in a tube fixed to the carotide artery of a man, and that the inward area of the left ventricle of his heart is equal to 15 square inches, these multiplied into $7\frac{1}{2}$ feet, give 1350 cubic inches of blood, which presses on that ventricle, when it first begins to contract, a weight equal to 15.5 pounds.

What the doctor thus calculates, from supposition, with regard to mankind, he actually experimented upon horses, dogs, fallow-does, &c. by fixing tubes in orifices opened in their veins and arteries; by observing the several heights to which the blood rose in these tubes, as they lay on the ground; and by measuring the capacities of the ventricles of the heart and orifices of the arteries. And, that the reader may the more readily compare the said estimates together, he has given a table of them, ranged in the following order.

TABLE.

Heart
||
Heat.

Heart
||
Heat.

The several animals.	Weight of each.	Height of the blood in the tube from the jugular vein.	Height of the blood in tubes fixed to arteries.	Capacity of the left ventricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantities of blood equal to the weight of the animal, in what time.	How much in a minute.	Weight of the blood sustained by the left ventricle contracting.	No of pulses in a minute.	Area of transverse section of descending aorta.	Area of the transverse section of ascending aorta.

HEART-burn, a disease usually called *cardialgia* by physicians. In surfeits, or upon swallowing without due mastication; when meats are eat tough and fat, or with farinaceous substances unfermented; or when by any accident the saliva is vitiated, too scanty, or not intimately mixed with the food, the fermentation becomes tumultuous, the stomach swells with air, and this extraordinary commotion being attended with an unusual heat, brings on the uneasiness called the *heart-burn*; which is remedied by whatever promotes a greater secretion of saliva, or helps to mix it with our aliment. The testaceous powders, as oyster-shells, crabs eyes, chalk, &c. are the usual remedies for the heart-burn.

HEARTH, that part of the pavement of a room on which the fire is immediately placed.

HEARTH-Money. See *CHIMNEY-Money*.

HEAT, in physiology, has a double meaning; being put either for that peculiar sensation which is felt on the approach of burning bodies, or for the cause of that sensation; in which last sense it is synonymous with *FIRE*. This mode of speaking, however, is inaccurate, and, by confounding the effect with the cause, sometimes produces obscurity: it were to be wished therefore that the word *heat* was used only to denote the effect; and *fire*, or some other term, to denote the cause of that effect.

The disputes which formerly were so much agitated in the learned world concerning the nature of heat, viz. whether it consisted merely in the motion of the terrestrial particles of bodies, or in that of a subtile fluid, are now mostly ceased, and it is almost univer-

sally believed to be the effect of a fluid. Unluckily, however, from the promiscuous use of the words *fire* and *heat*, an opinion seems to have gained ground, that there is in nature a fluid essentially *hot*; and that wherever the opposite sensation prevails, the former fluid is in part absent. Hence have arisen numberless speculations concerning the attraction, absorption, and capacities of bodies for heat; all of which being built on a false principle, have served no other purpose but to involve this part of natural philosophy in obscurity and confusion. Under the articles *CHEMISTRY*, *COMBUSTION*, *ELECTRICITY*, &c. it is so fully shown that *heat* properly so called is not a fluid, but the *modification* of a fluid, that it is superfluous to say any more on the subject at present. This being admitted, it will evidently follow, that *heat* can neither be absorbed nor attracted; neither can any body have a greater capacity for it than another, except in proportion to its bulk, which allows a larger quantity of the fluid to enter and to assume the particular motion which constitutes heat. From some of Dr Black's experiments indeed it would appear at first view, that heat was *absorbed*, or *attracted* in the strictest sense of the word: but this must be attributed merely to the transferring of the modification of the fluid from one substance to another, without regarding whether it is the identical quantity of fluid which acts as heat in one substance that is transferred to the other, or whether only by some unknown means a similar motion is produced in another portion of the same. At any rate, however, some word must be made use of to express this operation; and *absorption* or *attraction* will answer the purpose

Heat.

purpose as well as any others: but still we ought to remember, that these are inaccurate; and when we begin to argue from them as if they fully and exactly determined the mode in which the fluid acts, or rather is acted upon (for both these words suppose heat to be passive, and not active); we must certainly err. As to the phrases *capacity for containing heat*, *absolute heat*, &c. they are still more inaccurate than the words *absorption* and *attraction*, and cannot convey any distinct idea; whence the systems founded upon the explanations of these terms, assumed *gratis dictum* without the least proof, have never been able to support themselves, but are liable to endless and insuperable objections.

It is by no means indeed easy, nay we may boldly say that it is absolutely impossible, for human genius to investigate all the phenomena of this subtle and invisible element. All that can be done is, to discover a few general rules according to which the fluid acts in certain cases. From these we can only reason analogically to cases where its action is less obvious. But we are not to expect that by reasoning in this manner we can solve every phenomenon: nor can it be any recommendation to an hypothesis, merely that it solves *some* phenomena, unless we were able by its means to solve them all; but this no wise man will pretend to do, nay, not even to *know* them all. It appears exceedingly erroneous therefore to invent solutions of certain phenomena, and then to argue for the truth of the hypothesis from the facility with which the phenomena are explained by it. The true and proper method of proceeding in this case is to lay down certain principles established from the obvious phenomena of nature, and to reason from them fairly as far as we can; but where this ends, our knowledge must stop, and we cannot by any means proceed farther upon a sure foundation.

The only general principles as yet certainly established from obvious phenomena upon this subject are the following: 1. Heat and cold are found to expel one another. Hence we ought to conclude, that heat and cold are both *positives*; for a negative can neither be expelled nor accumulated. 2. Heat is *visibly* occasioned by the rays of the sun concentrated, and likewise by the fluid of electricity concentrated. If *fire*, therefore, properly so called, be the cause of heat, than which nothing can be more evident to our senses, we are certainly intitled to conclude, that both the light of the sun and the electric fluid are *elementary fire*. Hence also we conclude their identity; for two different substances cannot by any means produce constantly the same effect when put in the same circumstances, which both light and electricity do in this case, merely by *concentration*, or discharging a great quantity of the fluid upon a small portion of any terrestrial body. 3. Heat expands bodies in every direction: whence we conclude, that the fluid, when producing heat, acts from a centre towards a circumference; and by analogy, that when it produces *cold* it acts from a circumference towards a centre. 4. It appears from undeniable experiments, that heat, somehow or other, is the cause of fluidity. As the action of the fluid has already been shown, when it produces heat, to be from a centre to a circumference, it follows, that when the expansive action of the fluid is confined within the surface of any body,

5

this may be called its *latent* heat; because it extends not beyond the surface, and therefore cannot affect the thermometer, or be known to us as heat by the sense of feeling. But when this expansive action is transferred from the internal parts of the substance to the surface, it then affects the thermometer, and the body is said to become *hotter* at the same time that it congeals or is said to be *frozen*. This is what some philosophers call the conversion of the *latent* into *sensible* heat; others, the alteration of the *capacity*: but whatever term we give to the *effect*, the cause must remain the same, *viz.* the opposite actions of the same fluid; the expansive power in some cases counteracting or overcoming the condensing one, and *vice versa*. 5. Though sometimes the expansive action is sufficiently strong to produce fluidity *naturally*, and in most cases may be made so strong *artificially* as to make bodies fluid, yet in all cases it is not so. A certain degree of expansive power exists in all bodies whatever, and this by philosophers is called the *specific heat* of the body. 6. Whatever is called the *cooling* of any body is only the diminution of the expansive action upon its surface, or, if we may use the expression, on the surface of its particles. This is accomplished by an opposite power or modification of the fluid taking place on the outside; but when this becomes sufficiently strong to penetrate the whole substance, it then expels part of the fluid acting in the opposite direction, and then some change takes place in the texture of the body. It is, however, impossible to speak very perspicuously upon this subject, as the subtilty and indivisibility of the fluid render all reasonings upon it very precarious. 7. It is altogether impossible to calculate the quantity of absolute heat contained in any substance, because this depends on the proportion betwixt the quantity of fluid acting expansively and that acting in the opposite direction in the same. These two must some way or other counterbalance each other throughout the whole system of nature; and we may say with certainty, that any substance in which the one exists without the other, is none of those subject to the investigation of our senses, and all speculations concerning it must be vain. 8. When the fluid contained in any substance is vehemently agitated, this naturally produces an expansion in it; and therefore bodies become hot by violent friction, percussion, &c. In these cases, however, we have no right to say that the fluid is *expelled*, but only that its mode of action is altered; for this is constantly sufficient to produce heat, and in this indeed the very essence of heat consists. 9. When the expansive action of elementary fire within any substance becomes greater than is consistent with the cohesion of that substance, it is dissipated or resolved into vapour. This, however, may be done in such a manner that the heat still acts upon the separated parts of the body without spending any of its force upon external substances. Hence vapour continues to exist in a temperature much below that in which it was originally produced; nay, will sometimes be excessively cold to the touch, when it really contains as much heat, though in a *latent* state, as before. 10. When this latent heat is transferred to external bodies, the vapour then ceases to be vapour, or is *condensed*, and in some cases returns to its original state; in others, it is productive of light and vehement sensible heat:

whence

Heat.

Heat.

whence all the phenomena of DISTILLATION, EVAPORATION, FLAME, IGNITION, COMBUSTION, &c.

These are the principal facts which can be looked upon as *established* with regard to *heat* considered in a philosophical view. In common discourse it is always spoken of as a certain substance distinct from all others, and may properly enough be reckoned so with regard to all the purposes of life. In this sense, heat is accumulated by certain bodies in a much greater proportion than others. Dr Franklin made the experiment with pieces of cloth of various colours laid upon snow and exposed to the sunshine, and in all cases found that the pieces dyed with the darkest colours sunk deepest in the snow. Mr Cavallo examined the matter more accurately; first by observing the height to which a thermometer with a blackened bulb rose in comparison with one of clear glass, and then by comparing the heights of different thermometers whose bulbs were painted of various colours. Having therefore constructed two thermometers whose scales exactly corresponded with each other, he fixed them both upon the same frame, about an inch asunder, having the balls quite detached from the frame; and in this manner exposed them to the light of the sun or of a lamp. When these were exposed to the sun or kept in the shade, with the glass of both bulbs clear, they showed precisely the same degree; and the difference between the degree shown by the thermometers when exposed to the sun and when kept in the shade, at about the same time of the day, was very trifling.

The ball of one of the thermometers being painted black, and that of the other left clean, they showed different degrees of temperature on being exposed to the sun; the difference sometimes amounting to 10° : but was never constant; varying according to the clearness of the sun's light as well as of the air, and likewise according to the different degrees of temperature in the atmosphere.

On keeping the thermometer with the painted ball on the inside of a window, Mr Cavallo observed that strong day-light had an effect in raising the mercury as well as the sun's light. To ascertain this, he cleaned the bulb of the painted thermometer, and blackened that of the other; but the effect was constant, *viz.* the quicksilver in the tube of the thermometer, whose ball was painted black, was constantly higher than the other whenever they were exposed to the strong day-light. The difference was commonly about one-third of a degree, but sometimes it amounted to three-fourths, or even to a whole degree; and the experiment answered even when the sun was hid by clouds, which seems to indicate that every degree of light is accompanied with a corresponding one of heat.

By this consideration Mr Cavallo was induced to try whether, by directing the concentrated light of the moon upon the blackened bulb of a thermometer, it would be raised higher than a clean one standing in the same. The experiment was several times tried with a large lens, and afterwards with a burning mirror of 18 inches diameter; yet sometimes for want of proper means of observing the height of the mercury in the tubes of the thermometers, sometimes for want of a continued clear light of the moon, or in short from some unfavourable circumstance or other, he was never able to make a fair and decisive trial of this experiment.

N^o 149.

Heat.

Making trial of the heat of a lamp, he found that it also had a considerable effect. The ball of one being blackened, and both set at two inches distance from the flame of a lamp, they both rose from 58 to $65\frac{1}{2}$ deg. and the thermometer which was blackened to $67\frac{1}{2}$. Another time the uncoloured thermometer rose to $67\frac{1}{2}$, and the coloured one to $68\frac{1}{2}$. From a number of trials it at last appeared, that the difference at this distance from the lamp amounted generally to about a degree. When the thermometers were removed farther than two inches from the lamp, the difference decreased; and at the distance of about 14 or 15 inches it vanished entirely.

On this occasion Mr Cavallo had an opportunity of making a curious observation concerning the decrease of heat at different distances from the centre. "It is mathematically true, that emanations which proceed from a centre, and expand in a sphere, must become more and more rare in proportion to the squares of the distances from the centre. Thus it is said, that the intensity of light proceeding from a luminous body, at the double, treble, quadruple, &c. distance from that body, must be respectively four, nine, sixteen, times, &c. less dense. The same thing may be said of heat; but with respect to the latter, it appeared, that its intensity did not decrease exactly in the duplicate proportion of the distances from the flame of the lamp, but showed a very odd irregularity. It seemed to decrease faster than the duplicate proportion of the distances for the space of two inches and a half or three inches, after which it decreased much slower; but whether this proceeded from some different state of the air's purity at different distances from the flame of the lamp, or from the vapours coming from the flame, I cannot take upon me to determine."

Mr Cavallo next made some experiments upon thermometers, the balls of which were painted of various colours. His view was to examine with precision the degrees of heat imbibed by differently coloured substances, in order to determine whether they kept any proportion to the spaces occupied by the prismatic colours in the prismatic spectrum, or if they followed any other law. In these experiments he met with considerable difficulties, chiefly arising from the different nature of the colours with which the bulbs were painted. By reason of this diversity the bulbs could not be made equally smooth, which occasioned a considerable difference in the effect; as he found by painting two bulbs of thermometers with the same colour, only making the one smooth and the other rough.

To avoid this inconvenience, he attempted to make thermometers with tubes of differently coloured glass; but when a ball was formed with any of these, the glass of the ball was so thin, that it differed very little from that which was entirely colourless. He then included the thermometers in boxes, where the rays entered through coloured glasses; but here the rays were not only far from being homogeneous, but there was such a difference in the transparency of some of the coloured glasses, that this method proved also ineffectual. The least ambiguous method, therefore, was that of painting the balls of the thermometers with water-colours, taking care to lay them on as equally and smooth as possible. In this manner the experiments were repeated, using sometimes a dozen of thermometers

Heat. thermometers at once, whose balls were painted with various colours, and were exposed to the sun: but from a vast number of experiments, and some weeks observation, it could only be deduced, that if the colours with which the balls of the thermometers were painted had any considerable resemblance to those of the prism, those which were nearest to the violet showed a greater degree of heat than the others; but they were all, even that painted with white lead, in some intermediate degree between the blackened thermometer and that which was left quite clear. If the colours had not the proper density, the effects were different: thus, a thermometer painted with a light blue stood lower than another painted with good carmine.

In the course of his thermometrical experiments, Mr Cavallo likewise discovered a new method of determining the expansion of mercury by weight, which seemed capable of being carried to a greater degree of exactness than any other hitherto proposed. Having first blown a ball to a capillary tube, such as are commonly used for thermometers, he weighed it, and found the weight when empty to be 79.25 grains; and he observes, that in this experiment it is a precaution absolutely necessary to have the glass as accurately cleaned as possible. Some mercury was then introduced into the stem of the thermometer, taking care that none of it entered the ball; and by adapting a scale of inches to the tube, observed that 4.3 inches of it were filled with the mercury. The thermometer was now weighed again; and from this the weight of the glass being subtracted, the remainder, viz. 0.24 gr. showed the weight of that quantity of quicksilver which filled the 4.3 inches of the tube. Now the ball of the thermometer, and also part of the tube, were entirely filled with quicksilver; and in order to find out the weight of the mercury contained in it, the thermometer was weighed for the last time; and the weight of the glass being subtracted from this, the remainder, viz. 32.05 grains, showed the weight of the whole quantity of quicksilver contained in the thermometer.

By comparing this instrument with a graduated thermometer of Fahrenheit, and by applying a scale of inches, he found, that 20° on the new thermometer was equal to 1.37 inches. But 0.24 grains was the weight of as much mercury as filled 4.3 inches of the tube. Therefore, by the rule of proportion, it will be found, that the weight of as much quicksilver as fills 1.33 inches of the tube, viz. the length of 20°, is equal to 0.0742 of a grain nearly; and that the weight of as much quicksilver as fills a length of the tube equivalent to one degree, is equal to 0.00371 grains. Now it is clear, that the weight of the whole quantity of quicksilver contained in the thermometer is to the weight of as much as fills the length of one degree of the tube, as the bulk of the whole quantity of quicksilver in a given degree of heat to the increase of bulk that the same whole quantity of quicksilver acquires when heated but one degree; viz. 32.05 grains is to 0.00371 grains as 1 to 0.0011+. By which experiment it appears, that one degree of Fahrenheit's thermometer increases the bulk of mercury not above eleven hundredth thousandth parts. A small deviation from mathematical exactness is indeed produced by the difference of weight between the quicksilver of the tube

VOL. VIII. Part I.

when first weighed and when it is afterwards heated to one degree; but by an easy calculation it will be found, that this difference is so exceedingly small that it cannot be perceived with our most exact instruments either of weight or measure.

On repeating this experiment with other thermometers, each process varied a little from the other; which irregularity, Mr Cavallo thinks, was certainly owing to the imperfection of his scales: but by taking a mean of various experiments, it appears, that one degree of heat, according to Fahrenheit's thermometer, increases the bulk of a quantity of quicksilver in the temperature of 50° by about nine parts in 100,000; that is, if the bulk of any quantity of quicksilver in the temperature of 50° be 100,000, it will be 100,009 in the temperature of 51°.

In making experiments of this kind, it is necessary to have the bores of the tubes absolutely cylindrical; and the scales should be so exact as to turn with the hundredth part of a grain when charged with half an ounce weight.

HEAT of Burning Bodies. See COMBUSTION.

HEAT of Chemical Mixtures. This is a phenomenon necessarily resulting from the change of form produced in the different substances which are mixed together; and the manner in which it happens may be easily understood from the example of oil of vitriol and water. If equal quantities of concentrated vitriolic acid and water are mixed together, a very great degree of heat immediately takes place; inasmuch, that if the vessel which contains the mixture is made of glass it will probably break; and after it is cold, the mixture will be found to have shrunk in its dimensions, or will occupy less space than the bulk of the water and acid taken separately. In this case we know that the water, while in its fluid state, hath as much latent heat as it can contain; i. e. the elementary fire within it expands or separates its parts from each other, as much as is consistent with the constitution of the body. If any more is added, it cannot be absorbed, or direct its force upon the particles of the water without raising them in vapour: of consequence, part of this additional expansive power will be employed in the formation of vapour, and the rest will be discharged upon the neighbouring bodies, i. e. will be converted into *sensible* heat. The vitriolic acid, in its concentrated state, contains a great quantity of latent heat, which is necessary to preserve its fluidity. But when it is mixed with the fluid water, the latent heat contained in the latter is abundantly sufficient for both: of consequence, the great expansive power in the oil of vitriol itself becomes now totally useless, and therefore exerts its force upon the neighbouring bodies; and when the mixture returns to the original temperature of the oil of vitriol and water, it shows a loss of substance by its diminution in bulk. This may serve to explain all cases in chemistry where heat or cold is produced: and it will generally be found, that where bodies, by being mixed together, produce heat, they shrink in their dimensions; but when they produce cold, they are enlarged.

Methods of Measuring HEAT. See THERMOMETER.

Expansion of Metals by HEAT. See PYROMETER.

Degrees of HEAT which Animals are capable of bearing.

—The ancients were of opinion, that all countries lying

Heat. lying within the tropics were uninhabitable by reason of their heat: but time has discovered their mistake; and it is now found, that no part of the world is too hot for mankind to live in. The learned professor Boerhaave, in his chemistry, relates certain experiments made with great accuracy by the celebrated Fahrenheit, and others, at his desire, on this subject, in a sugar-baker's office; where the heat, at the time of making the experiments, was up to 146 degrees of Fahrenheit's thermometer. A sparrow, subjected to air thus heated, died, after breathing very laboriously, in less than seven minutes. A cat resisted this great heat somewhat above a quarter of an hour; and a dog about 28 minutes, discharging before his death a considerable quantity of a ruddy-coloured foam, and exhaled a stench so peculiarly offensive, as to throw one of the assistants into a fainting fit. This dissolution of the humours, or great change from a natural state, the professor attributes not to the heat of the stove alone, which would not have produced any such effect on the flesh of a dead animal; but likewise to the vital motion, by which a still greater degree of heat, he supposes, was produced in the fluids circulating through the lungs, in consequence of which the oils, salts, and spirits of the animal became so highly exalted.

Messieurs Du-Hamel and Tillet having been sent into the province of Augomois, in the years 1760 and 1761, with a view of endeavouring to destroy an insect which consumed the grain of that province, effected the same in the manner related in the Memoirs for 1761, by exposing the affected corn, with the insects included in it, in an oven, where the heat was sufficient to kill them without injuring the grain. This operation was performed at Rochefoucault, in a large public oven, where, for economical views, their first step was to assure themselves of the heat remaining in it on the day after bread had been baked in it. This they did, by conveying in a thermometer on the end of a shovel, which, on its being withdrawn, indicated a degree of heat considerably above that of boiling water: but M. Tillet, convinced that the thermometer had fallen several degrees in drawing to the mouth of the oven, and appearing under some embarrassment on that head, a girl, one of the attendants on the oven, offered to enter, and mark with a pencil the height at which the thermometer stood within the oven. The girl smiled on M. Tillet's appearing to hesitate at this strange proposition; and entering the oven, with a pencil given her for that purpose, marked the thermometer, after staying two or three minutes, standing at 100 degrees of Reaumur's scale, or, to make use of a scale better known in this country, at near 260 degrees of Fahrenheit's. M. Tillet began to express an anxiety for the welfare of his female assistant, and to press her return. This female salamander, however, assuring him that she felt no inconvenience from her situation, remained there 10 minutes longer; that is, near the time when Boerhaave's cat parted with her nine lives, under a much less degree of heat; when the thermometer standing at 288 degrees, or 76 degrees above that of boiling water, she came out of the oven, her complexion indeed considerably heightened, but her respiration by no means quick or laborious. After M. Tillet's return to Paris, these

experiments were repeated by Mons. Marantin, commissaire de guerre, at Rochefoucault, an intelligent and accurate observer, on a second girl belonging to the oven, who remained in it, without much inconvenience, under the same degree of heat, as long as her predecessor; and even breathed in air heated to about 325 degrees for the space of five minutes.

M. Tillet endeavoured to clear up the very apparent contrariety between these experiments and those made under the direction of Boerhaave, by subjecting various animals, under different circumstances, to great degrees of heat. From his experiments, in some of which the animals were swaddled with clothes, and were thereby enabled to resist for a much longer time the effects of the extraordinary heat, he infers, that the heat of the air received into the lungs was not, as was supposed by Boerhaave, the only or principal cause of the anxiety, laborious breathing, and death, of the animals on whom his experiments were made; but that the hot air, which had free and immediate access to every part of the surface of their bodies, penetrated the substance on all sides, and brought on a fever, from whence proceeded all the symptoms: on the contrary, the girls at Rochefoucault, having their bodies in great measure protected from this action by their clothes, were enabled to breathe the air, thus violently heated, for a long time without great inconvenience. In fact, we should think too, that the bulk of their bodies, though not thought of much consequence by M. Tillet, appears to have contributed not a little to their security. In common respiration, the blood, in its passage through the lungs, is cooled by being brought into contact with the external inspired air: In the present experiments, on the contrary, the vesicles and vessels of the lungs receiving at each inspiration an air heated to 300 degrees, must have been continually cooled and refreshed, as well as the subcutaneous vessels, by the successive arrival of the whole mass of blood contained in the interior parts of the body, whose heat might be supposed at the beginning of the experiment not to exceed 100 degrees. Not to mention, that M. Tillet's two girls may not possibly have been subjected to so great a degree of heat as that indicated by the thermometer; which appears to us to have always remained on the shovel, in contact with the earth.

These experiments soon excited other philosophers to make similar ones, of which some very remarkable ones are those of Dr Dobson at Liverpool, who gives the following account of them in the Philosophical Transactions, vol. lxxv.

"I. The sweating-room of our public hospital at Liverpool, which is nearly a cube of nine feet, lighted from the top, was heated till the quicksilver stood at 224° on Fahrenheit's scale, nor would the tube of the thermometer indeed admit the heat to be raised higher. The thermometer was suspended by a string fixed to the wooden frame of the sky-light, and hung down about the centre of the room. Myself and several others were at this time inclosed in the stove, without experiencing any oppressive or painful sensation of heat proportioned to the degree pointed out by the thermometer. Every metallic about us soon became very hot.

"II. My friend Mr Park, an ingenious surgeon of this place, went into the stove heated to 202°. Af-

Heat. ter ten minutes, I found the pulse quickened to 120. And to determine the increase of the animal-heat, another thermometer was handed to him, in which the quicksilver already stood at 98° ; but it rose only to $99\frac{1}{2}$, whether the bulb of the thermometer was inclosed in the palms of the hands or received in the mouth (A). The natural state of this gentleman's pulse is about 65.

"III. Another gentleman went through the same experiment in the same circumstances, and with the same effects.

"IV. One of the porters to the hospital, a healthy young man, and the pulse 75, was inclosed in the stove when the quicksilver stood at 210° ; and he remained there, with little inconvenience, for 20 minutes. The pulse, now 164, and the animal-heat, determined by another thermometer as in the former experiments, was $101\frac{1}{2}$.

"V. A young gentleman of a delicate and irritable habit, whose natural pulse is about 80, remained in the stove ten minutes when heated to 224° . The pulse rose to 145, and the animal heat to 102° . This gentleman, who had been frequently in the stove during the course of the day, found himself feeble, and disposed to break out into sweats for 24 hours after the experiment.

"VI. Two small tin vessels, containing each the white of an egg, were put into the stove heated to 224° . One of them was placed on a wooden seat near the wall, and the other suspended by a string about the middle of the stove. After ten minutes, they began to coagulate; but the coagulation was sensibly quicker and firmer in that which was suspended, than in that which was placed on the wooden seat. The progress of the coagulation was as follows: it was first formed on the sides, and gradually extended itself; the whole of the bottom was next coagulated; and last of all, the middle part of the top.

"VII. Part of the shell of an egg was peeled away, leaving only the film which surrounds the white; and part of the white being drawn out, the film sunk so as to form a little cup. This cup was filled with some of the *albumen ovi*, which was consequently detached as much as possible from every thing but the contact of the air and of the film which formed the cup. The lower part of the egg stood upon some light tow in a common gallipot, and was placed on the wooden seat in the stove. The quicksilver in the thermometer still continued at 224° . After remaining in the stove for an hour, the lower part of the egg which was covered with the shell was firmly coagulated, but that which was in the little cup was fluid and transparent. At the end of another hour it was still fluid, except on the edges where it was thinnest; and here it was still transparent; a sufficient proof that it was dried, not coagulated.

"VIII. A piece of bees-wax, placed in the same situation with the *albumen ovi* of the preceding experiment, and exposed to the same degree of heat in

Heat. the stove, began to melt in five minutes: another piece suspended by a string, and a third piece put into the tin vessel and suspended, began likewise to liquefy in five minutes."

Even these experiments, though more accurate than the former, do not show the utmost degrees of heat which the human body is capable of enduring. Some others, still more remarkable (as in them the body was exposed to the heat without clothes), by Drs Fordyce and Blagden, are also recorded in the Philosophical Transactions. They were made in rooms heated by flues in the floor, and by pouring upon it boiling water. There was no chimney in them, nor any vent for the air, excepting through crevices at the door. In the first room were placed three thermometers, one in the hottest part of it, another in the coolest part, and a third on the table, to be used occasionally in the course of the experiment. Of these experiments, the two following may be taken as a specimen.

"About three hours after breakfast, Dr Fordyce having taken off all his clothes, except his shirt, and being furnished with wooden shoes tied on with lisle, went into one of the rooms, where he staid five minutes in a heat of 90° , and begun to sweat gently. He then entered another room, and stood in a part of it heated to 110° . In about half a minute his shirt became so wet that he was obliged to throw it aside, and then the water poured down in streams over his whole body. Having remained in this heat for ten minutes, he removed to a part of the room heated 120° ; and after staying there 20 minutes, found that the thermometer placed under his tongue, and held in his hand, stood just at 100° , and that his urine was of the same temperature. His pulse had gradually risen to 145 pulsations in a minute. The external circulation was greatly increased, the veins had become very large, and an universal redness had diffused itself all over the body, attended with a strong feeling of heat; his respiration, however, was little affected. He concluded this experiment by plunging in water heated to 100° ; and after being wiped dry, was carried home in a chair; but the circulation did not subside for two hours.

"Dr Blagden took off his coat, waistcoat, and shirt, and went into one of the rooms, as soon as the thermometer had indicated a degree of heat above that of boiling water. The first impression of this hot air upon his body was exceedingly disagreeable, but in a few minutes all his uneasiness was removed by the breaking out of a sweat. At the end of 12 minutes he left the room very much fatigued, but no otherwise disordered. His pulse beat 136 in a minute, and the thermometer had risen to 220 degrees.

In others of these experiments it was found, that a heat even of 260° of Fahrenheit's thermometer could be submitted to with tolerable ease. But it must be observed, that in these great heats every piece of metal they carried about with them became intolerably hot.

X x 2

hot.

(A) The scale of the thermometer, which was suspended by the string about the middle of the room, was of metal; this was the only one I could then procure on which the degrees ran so high as to give any scope to the experiment. The scale of the other thermometer, which was employed for ascertaining the variations in the animal-heat, was of ivory.

Heat.

hot. Small quantities of water placed in metalline vessels quickly boiled; but in a common earthen vessel it required an hour and an half to arrive at a temperature of 140° , nor could it ever be brought near the boiling point. Neither durst the people, who with impunity breathed the air of this very hot room at 264 degrees, bear to put their fingers into the boiling water, which indicated only a heat of 212° . So far from this, they could not bear the touch of quicksilver heated only to 120° , and could but just bear spirit of wine at 130° .

Animal-HEAT. Of this there are various degrees; some animals preserving a heat of 100° or more in all the different temperatures of the atmosphere; others keep only a few degrees warmer than the medium which surrounds them; and in some of the more imperfect animals, the heat is scarcely one degree above the air or water in which they live.

The phenomenon of animal-heat hath, from the earliest ages, been the subject of philosophical discussion; and, like most other subjects of this nature, its cause is not yet ascertained. The best treatises that have appeared on the subject are those of Dr Dugud Leslie, published in 1778; and Mr Adair Crawford, in 1779. From the first of these performances, the following account of the different opinions on this subject is extracted.

1
Opinions of
the ancients
concerning
animal-
heat.

"The ancients possessed not the requisites for minutely investigating the science of nature; and, prone to superstition, attributed every phenomenon which eluded their investigation, to the influence of a supernatural power. Hippocrates, the father and founder of medicine, accounted animal heat a mystery, and bestowed on it many attributes of the Deity. In treating of that subject, he says in express terms, "what we call heat, appears to me to be something immortal, which understands, sees, hears, and knows every thing present and to come."—Aristotle seems to have considered the subject particularly, but nothing is to be met with in his works that can be said to throw light upon it.—Galen tells us that the dispute between the philosophers and physicians of his time was, "whether animal-heat depended on the motion of the heart and arteries; or whether, as the motion of the heart and arteries was innate, the heat was not also innate." Both these opinions, however, he rejects; and attempts a solution of the question on his favourite system, namely, the peripatetic philosophy: but his leading principles being erroneous, his deductions are of course inadmissible.

2
Of the mo-
derna.

"To enter into a minute detail of all the opinions offered by the moderns on the cause of animal-heat, would far exceed our limits. Most of them, however, may be referred to one or other of the three general causes of heat, viz. mixture, fermentation, and mechanical means, each of which we shall particularly consider.

"1. *Chemical mixture.* When chemical philosophy first came into vogue, and prevailed in the theory as well as practice of medicine, almost every operation in the animal machine was said to be the effect of ferment or mixture. From observing, that on the mixing of certain bodies far below the temperature of the human body, a degree of heat sometimes rising to actual inflammation was produced; they, without fur-

ther investigation, pronounced mixture the sole cause of animal heat. Various, however, were the opinions, not only respecting the place where the mixture happened, but also concerning the nature of the fluids of which it consisted. Van Helmont, Sylvius, and several others, supposed that the mixture took place in the intestinal tube; and ascribed it to an effervescence between the pancreatic juice and the bile. Others discovered acids in one place, and alkalies in another; but the general opinion for near two centuries was, That acedent fluids taken in, meeting with others of an alkaline nature already prepared in the body, gave rise to the degree of heat peculiar to animals. But those who are in the least acquainted with the laws of the animal economy, need not be told that these opinions are mere conjectures, founded on facts gratuitously assumed. No experiments have shown either an acedency or alkalescency in the bile that is sufficient to unite with the other animal juices, and generate the heat of animals. But though we should admit the supposition in its full extent, still it would by no means be sufficient to account for the stability of animal heat in different climates and seasons; its equality all over the body when in health; its partial increase in topical inflammations; or hardly indeed for any one phenomenon attending its production.

"Since, then, it appears that the fluids supposed to be mixed, the place in which the mixture is made, and every other circumstance relating to it, are neither ascertained nor seconded by analogy, none will, we presume, hesitate to reject every hypothesis of the cause of animal heat founded on the effects of mixture.

"2. *Fermentation.* When a more accurate and extensive knowledge of the various operations of nature had convinced physiologists of the absurdity of explaining the vital functions of animals, and the several changes which take place in the living body by the effects of chemical mixture, fermentation was substituted in its stead. All had observed, that fermentation was generally accompanied by heat; and few were ignorant, that that identical process, or one extremely similar to it, was constantly going forward in living animals; and it was not without some appearance of truth, that physiologists attributed animal heat to that cause.

"Formerly there were various modifications of this opinion; but of late it has been chiefly confined to one species of fermentation, viz. the putrefactive, which indeed is more consentaneous to experience and sound philosophy. For although animal substances are either directly or indirectly produced from vegetables, as all animals live on vegetables, or on animals that have lived on them; and though they may be ultimately resolved into the same principles; yet they are certainly combined in a different manner: for they constitute compounds, the natures of which are essentially different; and of the three stages of fermentation, the vinous, acetous, and putrid, the last is the only one to which they show a tendency. Milk indeed tends to the acetous, and even to the vinous fermentation; but as it can hardly be considered as perfectly animalized, it ought not to be considered as an exception to the general position. And though it be readily admitted, that animal matter is extremely apt to putrefy, and that even
in

Heat.

Heat.

in the living body there is a tendency to that process; yet it may be shown, that the degree to which it takes place can have little or no share in generating the heat of animals. In the first place, the effect of any degree of putrefaction in producing heat, is to this day so ill ascertained, that, with many ingenious philosophers, it is altogether problematical, whether or not animal substances, during the putrefactive process, do ever generate heat. Neither M. Beaume nor Dr Pearson, who made several accurate experiments with a view to ascertain this point, could, by the assistance of the most sensible thermometers, discover the least difference betwixt the temperature of the putrefying mixtures and the surrounding medium; and were the putrefaction of animal substances readily attended with the generation of heat, we might expect to find it greater in proportion to the bulk of the putrefying mass. This, however, is not the case; for it has often been found, that the largest masses of animal matter, such as the carcase of a large whale, laid out and exposed to the air in such a putrid condition as to affect all the neighbourhood with an intolerable stench, did not to the persons handling it feel sensibly hotter than the circumambient air. But what at once overturns every thing that can be advanced in favour of the generation of animal heat on the principles of putrefaction is, that heat is far more considerable in a living than in a dead body; and no rational physiologist will deny, that the putrid fermentation is going forward more rapidly in the latter than in the former.

“3. *The mechanical generation of heat.* This opinion first took its rise from an observation, that animal heat generally keeps pace with the state of the circulation: while the action of the heart and arteries continues unimpaired, a high degree of animal heat is produced; but when that action becomes more languid, the heat of the animal is diminished also. This, till very lately, was the favourite opinion of physicians, and was introduced immediately after Harvey had discovered the circulation of the blood, and indeed seems to be supported by many striking facts. Physiologists looked upon it as a matter almost capable of mathematical demonstration; yet they could not agree whether the heat of animals is occasioned by the friction of the blood against the vessels which contain it, or by the internal friction and agitation of the particles among one another. Various hypotheses accordingly were framed, and many ingenious arguments brought in support of them: but all suppositions of the mechanical kind are overthrown by some thermometrical observations of De Haen and others, from which it appeared, that the heat of the body was sometimes greater than is usual with healthy people, at the time the person was just expiring, when the action of the vessels was very weak; nay, even after he was dead, when it had entirely ceased. The abovementioned physician relates two very remarkable cases of this kind. In the one, he found that the temperature of his patient, which during the course of an inflammatory fever had never exceeded 103 degrees, at the time he expired, and for two minutes after, stood at 106. From the other it appeared, that the heat of a person who was dying of a lingering distemper, rose in the last agony from 100 to 101, and continued there stationary for two

hours; and, even at the expiration of 15 hours, had only fallen to 85°, though the surrounding medium did not exceed 60°. The examples also of those who are suffocated by fixed air, entirely overturn not only the mechanical system, but almost every other which hath yet appeared on the subject. [See the article BLOOD, n° 31.]

“One or other of the abovementioned hypotheses continued to be adopted by physicians, till Dr Cullen attempted a solution on a new set of principles; but, attentive to the diffidence with which novel opinions ought to be broached, he delivered his as little more than a mere conjecture. ‘May it not (says he) be supposed, that there is some circumstance in the vital principle of animals, which is in common to those of the same class, and of like economy; and which determines the effect of motion upon the vital principle to be the same, though the motion acting upon it may be in different circumstances?’—The doctor was driven to this supposition from the difficulty he found in explaining how so many animals of a different age, size, and temperament, should possess very nearly the same degree of heat; and in which it is impossible to show, that the motion of the blood in all its circumstances is exactly the same; or that in the different animals in which the degree of heat is considerably different, the motion of the circulating mass is in each correspondent to the difference of temperature. But, granting that the degree of heat does not always obtain in an exact ratio with the motion of the blood, and that this is an insuperable objection to its mechanical generation; yet there appear no plausible grounds for supposing that the effect of motion may be the same, while the motion acting upon it is in different circumstances. By this Dr Cullen means, that the different temperature of different animals is owing to a difference of the vital principle, inasmuch that the velocity of the blood may be the same in a frog as in a man; and yet, in consequence of the different vital principle, the heat produced may be different. The facts upon which he seems to lay the greatest stress are, That neither where the surrounding medium considerably surpasses the temperature of the living body, nor where it is far below it, is there any sensible change in the heat of animals. These, and some similar facts, in appearance countenance his hypothesis; yet we have no solid reason for imagining the principle of life to be different in different animals. And how are we to conceive, that the same degree of motion should in one class of animals always produce a certain degree of heat, and in another class as regularly a different one? A proposition of such a nature should, no doubt, require the most obvious facts and conclusive arguments to establish it; but, in the present instance, we do not perceive any probable reason, even from analogy. Besides, to say that the principle of life can generate heat or cold, independent of chemical or mechanical means, is contrary to experience, and seems in itself absurd.

“In the 66th volume of the Philosophical Transactions, Dr Hunter, after reciting some experiments concerning animal heat, asserts, That certain animals entirely destitute of nerves, are endowed with a power of generating their own heat; and this he brings as

Heat.

Dr Cullen's
opinion,
with ob-
jections.

Instit. of
Medicine,
p. 224.

Heat.

an *argumentum crucis* against those who account the nervous system the seat of animal-heat. If this is really a fact, it must, no doubt, have all the weight he ascribes to it; but it is plain that no stress can be laid upon it, unless it was better ascertained, which it is evident it never can be. For though we can positively assert that nerves exist where we see them, yet we cannot affirm with equal certainty that they do not also exist where we are not able to discover them. For all anatomists allow, that there are thousands of nervous filaments so finely interwoven into the composition of the more perfect animals of every size, that they elude not only the knife and naked eye, but even the best optical instruments hitherto invented. Since then we admit the presence of nerves in one tribe of animals, though we can only perceive them in their effects; what solid reason have we to deny them in another, in which we have the very same evidence, viz. certain indication, of sense and motion?

4
Dr Black's
opinion.

"Another theory, and perhaps the best supported which hath yet appeared on the subject, is that of Dr Black. That excellent chemist having observed, that not only breathing animals are of all others the warmest, but also that there subsists such a close and striking connection between the state of respiration and the degree of heat in animals, that they appear to be in an exact proportion to one another, was led to believe, that animal heat depends on the state of respiration; that it is all generated in the lungs by the action of the air upon the principle of inflammability, in a manner little dissimilar to what he supposed to occur in actual inflammation; and that it is thence diffused by means of the circulation over the rest of the vital system.

"This opinion is supported by many forcible arguments. 1. It is pretty generally known to naturalists, that a quantity of mephitic phlogisticated air is constantly exhaling from the lungs of living animals.— Since, therefore, atmospherical air, by passing through the lungs, acquires the very same properties as by passing through burning fuel, or by being exposed to any other process of phlogistication, it is obvious, that the change which the common air undergoes in both cases must be attributed to one and the same cause, viz. its combination with phlogiston. 2. It has likewise been urged in favour of the same hypothesis, that the celerity with which the principle of inflammability is separated in respiration, is very closely connected with the degree of heat peculiar to each animal. Thus, man, birds, and quadrupeds, vitiate air very fast; serpents, and all the amphibious kind, very slowly; and the latter are of a temperature inferior to the former, and breathe less frequently. 3. The most cogent arguments that have been brought in support of this opinion are, that no heat is generated till the function of respiration is established; and that the foetus *in utero* derives all its heat from the mother."

Upon this theory our author makes the following observations, which we shall give in his own words.

5
Objections
to it.

"These arguments may, perhaps, on a superficial view of the question, appear conclusive; but a sound reasoner, who shall coolly and impartially weigh every circumstance, will, I am confident, allow that they only afford a very ambiguous and imperfect evidence of

the doctrine they are meant to establish: and the subsequent animadversions on Dr Black's theory at large, will, it is hoped, suffice to show, that it is not only founded on dubious and controvertible principles, but that it is, in every point of light, clogged with unsurmountable difficulties.

"I. Many and various are the proofs which evince the improbability of the lungs being the source or laboratory of animal heat: for, though it be granted, that there subsists a very striking connection between the state of respiration and the degree of heat in animals, and that they are even in proportion to one another; yet it by no means ensues, that the former is positively the cause of the latter. For, were that really the case, it is obvious, that those animals which are destitute of the organs of respiration would generate no heat. That, however, is not true in fact: for those fishes which are even destitute of gills, appear from various experiments to be warmer than the ordinary temperature of the element in which they live; an irrefragable proof that the function of respiration is not absolutely necessary to the production of heat in animals.

"II. If the heat of living animals be generated solely in the lungs, two things necessarily follow: the first, That it can only be communicated to the other parts of the body through the channel of the arterial system; the second, That the heat must decrease as it recedes from its supposed centre. And a clear and satisfactory evidence of both these points will, no doubt, be deemed requisite to render Dr Black's opinion in any degree probable. So far, however, are we from meeting with those positive and convincing proofs which we had reason to expect, that we are not presented with a single plausible argument in favour of either of the points. On the contrary, it is more conformable to facts, that the venal blood is, if not warmer, at least as warm as the arterial. Dr Stevenson, an ingenious and accurate physiologist, with a view to ascertain this matter, laid bare the jugular vein and carotid artery of a calf, and then tied and cut them off at once, in order to let equal quantities of blood flow, in a given time, into vessels of an equal capacity, in each of which he had placed a well-adjusted thermometer; the result of the experiment was, that the thermometer immersed in the venous blood rose several degrees above that placed in the arterial. But though it is probable that there is not such a difference as that experiment seems to make, yet several reasons incline me to think, that the venous blood, instead of being colder, as Dr Black maintains, is in fact somewhat warmer, than the arterial; and what entirely overturns his opinion is, that no experiment, though many have been made, has ever shown that the temperature of the blood is higher in the left venticle of the heart than in the right, which must necessarily be the case, were all the heat of the animal body generated in the lungs.

"III. Having thus rendered it improbable that the generation of animal-heat should be entirely confined to the lungs, we shall venture a step farther, and endeavour to show, that the vital fluid, so far from acquiring all its heat in the pulmonary system, communicates no inconsiderable portion of what it had received in the course of the circulation to the air alternately

Heat.

Heat.

ternately entering into that organ and issuing from it. Various are the arguments which tend to evince this opinion. Were the blood heated in the lungs, we should certainly need less of their function in a warm than in a cold atmosphere: but we are taught by experience, that when the air is extremely hot, and we wish to be cooled, we breathe full and quick; and that when it is intensely cold, our respiration is slow and languid; which, were the blood heated in the lungs by the action of the air upon it, surely should not be the case. It is therefore more consonant with reason and experience, that the air which we inspire, by carrying off a quantity of evolved phlogiston from the lungs, rather contributes to diminish than increase the heat of breathing animals. Respiration, for this reason, has been very properly compared, by an ingenious physiologist, Dr Duncan of Edinburgh, to the blowing of bellows on a hot body. In both cases a considerable degree of heat is communicated to the air: but in neither can the air be said to generate any heat; for if it did, the heat of breathing animals should increase in proportion to the quantity of air inhaled, and a piece of inert matter heated to a certain degree should become hotter by ventilation.

“IV. The foetus *in utero*, according to Dr Black's hypothesis, generates no heat. The arguments by which he supports that position, how ingenious soever they may be, seem not sufficiently cogent to produce conviction; and as the question from its nature hardly admits of any direct experiment, our reasoning upon it must necessarily be analogical. Hence arises our embarrassment; for, as the discovering of analogies depends on the quickness and fertility of fancy, and the truth of all analogical ratiocination on the acuteness and nicety of judgment, two powers of the soul seldom united in an eminent degree, we cannot wonder that arguments of this kind, which to one man seem unanswerable, should to another appear futile.

“The only plausible objection to the generation of heat in the foetus, is, the supposition that it would in a short time accumulate in such a manner as to become incompatible with life.

“This argument, however, is more specious than solid; for, granting that the circulation which is carried on between the foetus and the mother, transmits very nearly the temperature of her blood, that by no means entirely supercedes the necessity of heat being generated in it. Various reasons lead to this opinion.—It is an axiom, that heat decreases as it recedes from the source from which it sprang. Now, if we admit for a moment Dr Black's opinion, and believe the heat of animals to be generated solely in the lungs, is it not obvious, that before it reaches the uterus, passes through the very minute tubes by which that organ is connected to the placenta, circulates through the umbilical vessels, and pervades the extreme parts of the foetus, it must be too much diminished to support that equilibrium which obtains in every part of the living system. Besides, as the foetus *in utero* may properly enough be accounted a part of the mother,

the same objections that are brought against the generation of heat in it would hold equally good against the production of heat in any part or organ of her body, except the lungs. But such a multitude of accurate thermometrical observations have evinced the partial increase of heat in local inflammations, that no room is left to doubt, that in every individual part of the vital frame heat is generated; and if the foetus be, from any cause whatever, liable to topical inflammation, a thing which no physiologist has ever pretended to deny, what shadow of reason is there for doubting that such affections are accompanied with the same effects before as after birth, and consequently with a partial increase of heat?”

Our author having now, as he supposes, refuted the opinions of others, after showing that heat, though ^{6.} generated, cannot accumulate in the foetus, proceeds to lay down his own theory, which depends on the following principles.

1. That the blood does contain phlogiston.
2. That this phlogiston is evolved, extricated; or brought into a state of activity and motion by the action of the blood-vessels to which it is subjected in the course of circulation
3. That the evolution of phlogiston is a cause which throughout nature produces heat, whether that heat be apparently excited by mixture, fermentation, percussion, friction, inflammation, ignition, or any similar cause.
4. That this heat, which must be produced in consequence of the evolution of the phlogiston from the blood of different animals, is in all probability equal to the highest degree of heat which these animals in any case possess (B).

The first and second of these propositions will readily be granted: but the third is liable to a very great objection, namely, that from putrefying bodies, phlogiston is evolved in quantity sufficient to reduce to their metallic form the calces of some metals exposed to the vapour, as Dr Dugud hath acknowledged; yet he himself affirms, that no sensible heat is produced by putrefying animal substances. To this he is obliged to reply, that phlogiston is extricated more slowly from mixtures undergoing the putrid fermentation, than from such as are undergoing the vinous and acetous ones; and that the volatile alkali produced from putrefying substances likewise hinders the action of the phlogiston. But the first part of this answer is not proved, and is what he himself calls only a *probable conjecture*. Neither doth the second appear to be well founded: for putrefying substances, urine excepted, afford but little volatile alkali; and even putrid urine itself, which affords such a large portion, is not colder than other putrid matters.

It is however needless to insist farther on this theory, since his fundamental principle, namely, That the venous blood is warmer than the arterial, hath been shown to be false by Mr Adair Crawford, of whose hypothesis we must now give an account.

This gentleman, who, in his general doctrine of heat, seems to agree with Dr Irvin of Glasgow, begins with ^{8.} Mr Crawford's theory.

(B) These theories, inserted in the last edition of this work, we thought it proper to retain, as there seems still a possibility of the phlogistic doctrine regaining its ground, though now threatened with being expelled from the system of nature. A particular account of the dispute concerning PHLOGISTON is given under that article.

Heat.

an explanation of his terms. The words *heat* and *fire*, he tells us, are ambiguous. *Heat* in common language has a double signification. It is used indiscriminately to express a sensation of the mind, and an unknown principle, whether we call it a *quality* or a *substance*, which is the exciting cause of that sensation. The latter, he, with Dr Irvin, calls *absolute heat*; the former, *sensible heat*. The following are the general facts upon which his experiments are founded.

1. Heat is contained in great quantities in all bodies when at the common temperature of the atmosphere.

2. Heat has a constant tendency to diffuse itself over all bodies, till they are brought to the same degree of sensible heat.

3. If the parts of the same homogeneous body have the same degree of sensible heat, the quantities of absolute heat will be proportionable to the bulk or quantity of matter. Thus the quantity of absolute heat contained in two pounds of water, must be conceived to be double of that which is contained in one pound, when at the same temperature.

4. The mercurial thermometer is an accurate measure of the comparative quantities of absolute heat which are communicated to the same homogeneous bodies or separated from them, as long as such bodies continue in the same form. If therefore the sensible heat of a body, as measured by the mercurial thermometer, were to be diminished the one half, or the one third, or in any given proportion, the absolute heat would be diminished in the same proportion.

5. The comparative quantities of absolute heat which are communicated to different bodies, or separated from them, cannot be determined in a direct manner by the thermometer. Thus, if the temperature of a pound of mercury be raised one degree, and that of a pound of water one degree, as indicated by the thermometer, it does not by any means follow, that equal quantities of absolute heat have been communicated to the water and the mercury. [See HEAT and THERMOMETER.]—If a pint of mercury at 100° be mixed with an equal bulk of water at 50° , the change produced in the heat of the mercury will be to that produced in the water as three to two: from which it may be inferred, that the absolute heat of a pint of mercury is to that of an equal bulk of water as two to three; or, in other words, that the comparative quantities of their absolute heats are reciprocally proportionable to the changes which are produced in their sensible heats, when they are mixed together at different temperatures. This rule, however, does not apply to those mixtures which generate sensible heat or cold by chemical action.

From the above position, says Mr Crawford, it follows, that equal weights of heterogeneous substances, as air and water, having the same temperature, may contain unequal quantities of absolute heat. There must, therefore, be certain essential differences in the nature of bodies, in consequence of which some have the power of collecting and retaining the element of fire in greater quantities than others, and these differences he calls throughout his treatise the *capacities* of bodies for containing heat.

Having premised these general facts, our author gives an account of a number of experiments made,

No 149.

Heat.

in order to ascertain the quantity of absolute heat contained in different bodies. These experiments were made by mixing the bodies to be examined with water, heated to different degrees; and by the temperature of the mixture, he found the proportion of the capacity of the bodies for containing heat, to water, and, of consequence, to one another. Thus he found the capacity of wheat for containing heat to be to that of water as 1 to 2.9; and, of consequence, the absolute heats of the two substances to be in the same proportion. The absolute heat of oats to that of water he found as 1 to $2\frac{1}{2}$; of barley, as 1 to 2.4; of beans, as 1 to 1.6; of flesh, as 1 to 1.3; of milk, as 1 to 1.1; and of a mixture of venous and arterial blood from a sheep, as 25.4 to 24.4. By other experiments he determined, that the absolute heat of venous blood was to that of water only as 100 to 112, whereas the absolute heat of arterial blood was to that of water as 100 to 97.08.

By experiments made with air of different kinds contained in bladders, and immersed in water, he found that the absolute heat of atmospherical air was exceedingly great, being to that of water as 18.6 to 1; that of dephlogisticated air was still greater, being to the heat of common atmospherical air as 4.6 to 1. The heat of phlogisticated and fixed air was much less; that of the latter, particularly, being to the heat of atmospherical air only as 1 to 67.

From other experiments made on metals, Mr Crawford concludes, that the absolute heat of tin, in its metallic state, is to that of water as 1 to 14.7; but the heat of calcined tin is to that of water as 1 to 10.4. In like manner, the heat of iron was to that of water only as 1 to 8; but that of the calx of iron was to the heat of water as 1 to 3.1, &c. And from these experiments he is of opinion, that the more phlogiston that is added to any body, the less is its capacity for containing heat.

From these experiments our author deduces the following theory of animal heat.—“It has been proved, that the air, which is expired from the lungs of animals, contains less absolute heat than that which is inhaled in inspiration. It has been shown, particularly, that in the process of respiration, atmospherical air is converted into fixed air; and that the absolute heat of the former is to that of the latter as 67 to 1.

“Since therefore the fixed air which is exhaled by expiration is found to contain only the one sixty-seventh part of the heat which was contained in the atmospherical air previous to inspiration, it follows, that the latter must necessarily deposit a very great proportion of its absolute heat in the lungs. It has moreover been shown, that the absolute heat of florid arterial blood is to that of venous as $11\frac{1}{2}$ to 10. And hence, as the blood, which is returned by the pulmonary vein to the heart, has the quantity of its absolute heat increased, it is evident that it must have acquired this heat in its passage through the lungs. We may conclude, therefore, that in the process of respiration, a quantity of absolute heat is separated from the air and absorbed by the blood.

“That heat is separated from the air in respiration, is farther confirmed by the experiment with phlogisticated air; from which, compared with Dr Priestley’s dis-

Heat. discoveries, it is manifest, that the power of any species of air in supporting animal life, is nearly in proportion to the quantity of absolute heat which it contains, and is consequently proportionable to the quantity which it is capable of depositing in the lungs.

"The truth of this conclusion will perhaps appear in a clearer light from the following calculation, by which we may form some idea of the quantity of heat yielded by atmospherical air when it is converted into fixed air, and also of that which is absorbed during the conversion of venous into arterial blood.

"We have seen, that the same heat which raises atmospherical air one degree, will raise fixed air nearly 67 degrees; and consequently that the same heat which raises atmospherical air any given number of degrees, will raise fixed air the same number of degrees multiplied by 67. In the Petersburg experiment of freezing quicksilver, the heat was diminished 200 degrees below the common temperature of the atmosphere. We are therefore certain, that atmospherical air, when at the common temperature of the atmosphere, contains at least 200 degrees of heat. Hence, if a certain quantity of atmospherical air, not in contact with any body that would immediately carry off the heat, should suddenly be converted into fixed air, the heat which was contained in the former would raise the latter 200 degrees multiplied by 67, or 13400 degrees. And the heat of red-hot iron being 1050, it follows that the quantity of heat, which is yielded by atmospherical air when it is converted into fixed air, is such (if it were not dissipated) as would raise the air so changed to more than 12 times the heat of red-hot iron.

"If therefore the absolute heat which is disengaged from the air in respiration, were not absorbed by the blood, a very great degree of sensible heat would be produced in the lungs.

"Again, it has been proved, that the same heat which raises venous blood 115 degrees, will raise arterial only 100 degrees; and consequently, that the same heat which raises venous blood any given number of degrees, will raise arterial a less number, in the proportion of 100 to 115, or 20 to 23. But we know that venous blood contains at least 230 degrees of heat. Hence, if a certain quantity of venous blood, not in contact with any body that would immediately supply it with heat, should suddenly be converted into arterial, the heat which was contained in the former would raise the latter only $\frac{20}{23}$ or 230 degrees, or 200 degrees; and consequently the sensible heat would suffer a diminution equal to the difference between 230 and 200, or 30 degrees. But the common temperature of blood is 96: when, therefore, venous blood is converted into arterial in the lungs, if it were not supplied by the air with a quantity of heat proportionable to the change which it undergoes, its sensible heat would be diminished 30 degrees, or it would fall from 96 to 66.

"That a quantity of heat is detached from the air, and communicated to the blood, in respiration, is moreover supported by the experiments with metals and their calces: from which it appears, that when bodies are joined to phlogiston, they lose a portion of their absolute heat; and that, when the phlogiston is again

disengaged, they reabsorb an equal portion of heat from the surrounding bodies.

"Now it has been demonstrated by Dr Priestley, that in respiration, phlogiston is separated from the blood, and combined with the air. During this process, therefore, a quantity of absolute heat must necessarily be disengaged from the air by the action of the phlogiston; the blood, at the same moment, being left at liberty to unite with that portion of heat which the air had deposited.

"And hence animal heat seems to depend upon a process similar to a chemical elective attraction. The air is received into the lungs, containing a great quantity of absolute heat. The blood is returned from the extremities, highly impregnated with phlogiston. The attraction of the air to the phlogiston is greater than that of the blood. This principle will, therefore, leave the blood to combine with the air. By the addition of the phlogiston, the air is obliged to deposit a part of its absolute heat; and as the capacity of the blood is at the same moment increased by the separation of the phlogiston, it will instantly unite with that portion of heat which had been detached from the air.

"We learn from Dr Priestley's experiments with respect to respiration, that arterial blood has a strong attraction to phlogiston: it will consequently, during the circulation, imbibe this principle from those parts which retain it with least force, or from the putrescent parts of the system: and hence the venous blood, when it returns to the lungs, is found to be highly impregnated with phlogiston. By this impregnation, its capacity for containing heat is diminished. In proportion, therefore, as the blood, which had been dephlogisticated by the process of respiration, becomes again combined with phlogiston in the course of the circulation, it will gradually give out that heat which it had received in the lungs, and diffuse it over the whole system.

"Thus it appears, that, in respiration, the blood is continually discharging phlogiston and absorbing heat; and that, in the course of circulation, it is continually imbibing phlogiston and emitting heat.

"It may be proper to add, that as the blood, by its impregnation with phlogiston, has its capacity for containing heat diminished; so, on the contrary, those parts of the system from which it receives this principle, will have their capacity for containing heat increased, and will consequently absorb heat.

"Now if the changes in the capacities, and the quantities of matter changed in a given time, were such, that the whole of the absolute heat separated from the blood were absorbed, it is manifest that no part of the heat which is received in the lungs would become sensible in the course of the circulation.

"That this, however, is not the case, will, I think, be evident from the following considerations:

"We know that sensible heat is produced by the circulation of the blood; and we have proved by experiment, that a quantity of absolute heat is communicated to that fluid in the lungs, and is again disengaged from it in its progress through the system. If, therefore, the whole of the absolute heat, which is separated from the blood, were absorbed by those parts

Heat.

of the system from which it receives the phlogiston, it would be necessary to have recourse to some other cause, to account for the sensible heat which is produced in the circulation. But, by the rules of philosophizing, we are to admit no more causes of natural things than such as are both true and sufficient to explain the appearances; for nature delights in simplicity, and affects not the pomp of superfluous causes.

"We may, therefore, safely conclude, that the absolute heat which is separated from the air in respiration, and absorbed by the blood, is the true cause of animal-heat.

"It must nevertheless be granted, that those parts of the system which communicate phlogiston to the blood, will have their capacity for containing heat increased; and therefore, that a part of the absolute heat which is separated from the blood will be absorbed.

"But from the quantity of heat, which becomes sensible in the course of the circulation, it is manifest that the portion of heat which is thus absorbed is very inconsiderable.

"It appears, therefore, that the blood, in its progress through the system, gives out the heat which it had received from the air in the lungs: a small portion of this heat is absorbed by those particles which impart the phlogiston to the blood; the rest becomes redundant, or is converted into moving and sensible heat."

The subject
still uncertain.

Mr Crawford's theory, which doth not essentially differ from Dr Black's, seems to be the best that hath yet appeared. There is, however, one difficulty which seems common to them all, and which, even on Mr Crawford's principles, seems not to admit of solution. If animal heat entirely depends on something peculiar to a living body, why doth it sometimes continue after life hath ceased? If heat depends on the evolution of phlogiston by the action of the blood-vessels, according to Dr Dugud, why should it remain when these vessels cease to act, as, according to Dr Dugud himself, it sometimes doth? If, according to Mr Crawford, it is every moment attracted from the air, why is it not always in proportion to the respiration? Or, if fixed air contains such a small proportion of absolute heat as, by Mr Crawford's experiments, it seems to do, why doth it impart such a strong and lasting degree of heat to the bodies of those who are killed by it? See BLOOD, n^o 31.

Other objections have been made by Mr Pearson, which are related in the Medical Journal. They are founded on some appearances found on the dissection of morbid bodies; where it has been found that the pulmonary artery, and even the lungs themselves, have been totally destroyed by disease, and yet the person has survived for some time. In these cases, however, it is probable, that the blood had still an opportunity of absorbing the vital principle from the air, which might make those produce heat also by some mechanism unknown to us. The whole of Dr Crawford's doctrine of latent heat has also been attacked in a Treatise by Mr Leopold Vacca Berlinghieri. His objections are derived from the calculations of Dr Crawford himself; but our limits will not admit of our entering into this dispute.

Internal HEAT of the Earth. That there is a very

considerable degree of heat always felt in digging to great depths in the earth, is agreed upon by all naturalists: but the quantity of this heat hath seldom been measured in any part; much less is it known, whether in digging to an equal depth in different parts of the earth, the heat is found always the same. In digging mines, wells, &c. they find that at a little depth below the surface it feels cold. A little lower it is colder still, as being beyond any immediate influence of the sun's rays; inasmuch that water will freeze almost at any season of the year: but when we go to the depth of 40 or 50 feet, it begins to grow warm, so that no ice can bear it; and then the deeper we go, still the greater the heat, until at last respiration grows difficult, and the candles go out.

This heat of the earth hath been variously explained. Some have had recourse to an immense body of fire lodged in the centre of the earth, which they consider as a central sun, and the great principle of the generation, vegetation, nutrition, &c. of fossil and vegetable bodies. But Mr Boyle, who had been at the bottom of some mines himself, suspects that this degree of heat, at least in some of them, may arise from the peculiar nature of the minerals generated therein. To confirm this, he instances a mineral of a vitriolic kind, dug up in large quantities in many parts of England, which by the bare affusion of common water will grow so hot, that it will almost take fire.—These hypotheses are liable to the following objections. 1. If there is within the earth a body of actual fire, it seems difficult to show why that fire should not consume and moulder away the outer shell of earth, till either the earth was totally destroyed, or the fire extinguished. 2. If the internal heat of the earth is owing to the action of water upon mineral substances, that action through time must have ceased, and the heat have totally vanished; but we have no reason to think that the heat of the earth is any thing less just now than it was a thousand years ago. The phenomenon is easily explained by the propositions laid down under the article HEAT. If heat is nothing else than a certain mode of action in the ethereal fluid, or the matter of light, by which it flows out from a body in all directions as radii drawn from the centre to the circumference of a circle; it will then follow, that if an opaque body absorbs any considerable quantity of light, it must necessarily grow hot. The reason of this is plain. The body can hold no more than a certain quantity of ethereal matter; if more is continually forcing itself in, that which has already entered must go out. But it cannot easily get out, because it is hindered by the particles of the body among which it is detained. It makes an effort therefore in all directions to separate these particles from each other; and hence the body expands, and the effort of the fluid to escape is felt when we put our hands on the body, which we then say is *hot*. Now, as the earth is perpetually absorbing the ethereal matter, which comes from the sun in an immense stream, and which we call his *light*, it is plain, that every pore of it must have been filled with this matter long ago. The quantity that is lodged in the earth, therefore, must be continually endeavouring to separate its particles from each other, and consequently must make it hot. The atmosphere, which is perpetually receiving that portion of the ethereal matter which

Heat.

Heat,
Heath.

which issues from the earth, counteracts the force of the internal heat, and cools the external surface of the earth, and for a considerable way down; and hence the earth for 20 or 30 feet down, shows none of that heat which is felt at greater depths. See HEAT.

HEAT, in medicine. Great heats are not so much the immediate, as the remote, cause of a general sickness, by relaxing the fibres, and disposing the juices to putrefaction; especially among soldiers and persons exposed the whole day to the sun: for the greatest heats are seldom found to produce epidemic diseases, till the perspiration is stopped by wet clothes, fogs, dews, damps, &c. and then some bilious or putrid distemper is the certain consequence, as fluxes and ardent intermitting fevers. Nevertheless, it must be allowed, that heats have sometimes been so great as to prove the more immediate cause of particular disorders; as when centinels have been placed without cover or frequent reliefs in scorching heats; or when troops march or are exercised in the heat of the day; or when people imprudently lie down and sleep in the sun. All these circumstances are apt to bring on distempers, varying according to the season of the year. In the beginning of summer, these errors produce inflammatory fevers; and in autumn, a remitting fever or dysentery. To prevent, therefore, the effects of immoderate heats, commanders have found it expedient so to order the marches, that the men come to their ground before the heat of the day; and to give strict orders, that none of them sleep out of their tents, which, in fixed encampments, may be covered with boughs to shade them from the sun. It is likewise a rule of great importance to have the soldiers exercised before the cool of the morning is over; for by that means not only the sultry heats are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Lastly, in very hot weather, it has often been found proper to shorten the centinels duty, when obliged to stand in the sun.

HEATH, in botany. See ERICA.

Berry-bearing HEATH. See EMPETRUM.

HEATH (James), an English historian, was born 1629 at London; where his father, who was the king's cutler, lived. He was educated at Westminster school, and became a student of Christ-church, Oxford, in 1646. In 1648, he was ejected from thence by the parliament visitors for his adherence to the royal cause; lived upon his patrimony till it was almost spent; and then marrying, was obliged to write books and correct the press in order to maintain his family. He died of a consumption and dropsy at London in August 1664, and left several children to the parish. His principal publications were, 1. A brief Chronicle of the late Intestine War in the Three Kingdoms of England, Scotland, and Ireland, &c. 1661, 8vo; afterwards enlarged by the author, and completed from 1637 to 1663, in four parts, 1663, in a thick 8vo. To this was again added a continuation from 1663 to 1675 by John Philips, nephew by the mother to Milton, 1676, folio. 2. Flagellum: or, The Life and Death, Birth and Burial, of Oliver Cromwell, the late Usurper, 1663. The third edition came out with additions in 1665, 8vo. 3. A New Book of Loyal English Martyrs and Confessors, who have endured

the Pains and Terrors of Death, Arraignment, &c. for the Maintenance of the just and legal Government of these Kingdoms both in Church and State, 1663, 12mo. The reason why such writers as our author continue to be read, and will probably always be read, is not only because *Historia quoquo modo scripta delectat*; but also because in the meanest historian there will always be found some facts, of which there will be no cause to doubt the truth, and which yet will not be found in the best. Thus Heath, who perhaps had nothing but pamphlets and newspapers to compile from, frequently relates facts that throw light upon the history of those times, which Clarendon, though he drew every thing from the most authentic records, has omitted.

HEATH (Thomas), an alderman of Exeter, and father of John Heath, Esq; one of the judges of the Common pleas, was author of An Essay towards a new English Version of the Book of Job from the original Hebrew, with some account of his Life, 1755, 8vo.—His brother Benjamin, a lawyer of eminence, and town clerk of Exeter, was likewise an author; and wrote, 1. An Essay towards a demonstrative Proof of the Divine Existence, Unity, and Attributes; to which is premised, A short Defence of the Argument commonly called *a priori*, 1740. 2. The Case of the County of Devon with respect to the Consequences of the New Excise Duty on Cyder and Perry. Published by the direction of the Committee appointed at a General Meeting of that County to superintend the Application for the Repeal of that Duty, 1763, 4to. 3. *Nota five Lectiones ad Tragicorum Græcorum veterum, Æschyli, &c.* 1752, 4to; a work which places the author's learning and critical skill in a very conspicuous light. The same solidity of judgment apparent in the preceding, distinguished the author's last production. 4. A Revival of Shakespeare's Text, wherein the alterations introduced into it by the more modern editors and critics are particularly considered, 1765, 8vo.

HEATHENS, in matters of religion. See PAGANS.

HEAVEN, literally signifies the expanse of the firmament, surrounding our earth, and extended every way to an immense distance.

HEAVEN, among Christian divines and philosophers, is considered as a place in some remote part of infinite space, in which the omnipresent Deity is said to afford a nearer and more immediate view of himself, and a more sensible manifestation of his glory, than in the other parts of the universe. This is often called the *empyrean*, from that splendor with which it is supposed to be invested; and of this place the inspired writers give us the most noble and magnificent descriptions.

The Pagans considered heaven as the residence only of the celestial gods, into which no mortals were admitted after death, unless they were deified. As for the souls of good men, they were consigned to the *elysian fields*. See *ELYSIAN-Fields*.

HEAVEN, among astronomers, called also the *æthereal* and *starry heaven*, is that immense region wherein the stars, planets, and comets, are disposed. See *ASTRONOMY, passim*.

Heath
||
Heaven.

Heaven,
Hebdoma-
dary.

This is what Moses calls the *firmament*, speaking of it as the work of the second day's creation; at least it is thus the word *קִמְיָה* is usually rendered by his interpreters; though somewhat abusively, to countenance their own notion of the heavens being firm or solid. The word, it is certain, properly signifies no more than expanse or extension; a term very well adapted by the prophet to the impression which the heavens make on our senses; whence, in other parts of scripture, the heaven is compared to a curtain, or a tent stretched out to dwell in. The LXX first added to this idea of expansion that of firm or solid; rendering it by *σπεραιμα*, according to the philosophy of those times; in which they have been followed by the modern translators.

The later philosophers, as Des Cartes, Kircher, &c. have easily demonstrated this heaven not to be solid, but fluid; but they still suppose it full, or perfectly dense, without any vacuity, and cantoned out into many vortices. — But others have overturned not only the solidity, but the supposed plenitude, of the heavens. Sir Isaac Newton has abundantly shown the heavens void of almost all resistance, and, consequently, of almost all matter: this he proves from the phenomena of the celestial bodies; from the planets persisting in their motions without any sensible diminution of their velocity; and the comets freely passing in all directions towards all parts of the heavens.

Heaven, taken in a general sense, for the whole expanse between our earth and the remotest regions of the fixed stars, may be divided into two very unequal parts, according to the matter found therein; viz. the atmosphere, or aerial heaven, possessed by air; and the æthereal heaven, possessed by a thin, unresisting medium, called *æther*.

HEAVEN is more particularly used, in astronomy, for an orb, or circular region, of the æthereal heaven.

The ancient astronomers assumed as many different heavens as they observed different motions therein. These they supposed all to be solid, as thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion. Thus we had seven heavens for the seven planets; viz. the heavens of the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. The eighth was for the fixed stars, which they particularly called the *firmament*. Ptolemy adds a ninth heaven, which he called the *primum mobile*. After him two crystalline heavens were added by king Alphonsus, &c. to account for some irregularities in the motions of the other heavens; and lastly, an empyrean heaven was drawn over the whole, for the residence of the Deity; which made the number twelve. But others admitted many more heavens, according as their different views and hypotheses required. Eudoxus supposed 23, Calippus 30, Regiomontanus 33, Aristotle 47, and Fracastor no less than 70. It must be added, however, that the astronomers did not much concern themselves whether the heavens they thus allow of were real or not; provided they served a purpose in accounting for any of the celestial motions, and agreed with the phenomena.

HEBDOMADARY, HEBDOMADARIUS, or HEBDOMADIUS, a member of a chapter or convent, whose week it is to officiate in the choir, to rehearse the anthems and prayers, and to perform the usual

functions which the superiors perform at solemn feasts, and other extraordinary occasions. The word is formed of the Greek *εβδομας*, which signifies the number seven; of *πτα*, seven.

The hebdomadary generally collates to the benefices which become vacant during his week; though it is usually looked upon as an abuse.

In cathedrals, the hebdomadary was a canon or prebendary, who had the peculiar care of the choir, and the inspection of the officers for his week.

In monasteries, the hebdomadary is he who waits at table for a week, or other stated period; directs and assists the cook, &c.

HEBDOME, a solemnity of the ancient Greeks, in honour of Apollo, in which the Athenians sung hymns to his praise, and carried in their hands branches of laurel. The word signifies the *seventh day*, this solemnity being observed on the seventh day of every lunar month.

HEBE, in ancient mythology, a goddess, the idea of whom, among the Romans, seems to have been much the same with that of eternal youth, or an immortality of bliss; agreeably to which, she is represented on a gem, in the great duke's collection at Florence, with a young airy look, and drinking out of a little bowl; or, according to Milton's expression, "Quaffing immortality and joy." She is fabled to have been a daughter of Jupiter and Juno. According to some she was the daughter of Juno only, who conceived her after eating lettuces. As she was fair and always in the bloom of youth, she was called the goddess of youth, and made by her mother cup-bearer to all the gods. She was dismissed from her office by Jupiter, because she fell down in an indecent posture as she was pouring nectar to the gods at a grand festival; and Ganymedes, the favourite of Jupiter, succeeded her as cup-bearer. She was employed by her mother to prepare her chariot, and to harness her peacocks whenever requisite. When Hercules was raised to the rank of a god, he was reconciled to Juno by marrying her daughter Hebe, by whom he had two sons, Alexiares and Anicetus. As Hebe had the power of restoring gods and men to the vigour of youth, she, at the instance of her husband, performed that kind of office to Iolaus his friend. Hebe was worshipped at Sicyon, under the name of Dia, and at Rome under that of Juventas.

HEBENSTRETIA, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 48th order, *aggregata*. The calyx is emarginated, and divided below; the corolla unilabiate; the lip rising upwards, and quadrifid; the capsule dispermous; the stamina inserted into the margin of the limb of the corolla.

HEBER, the son of Salah, and father of Peleg, from whom the Hebrews derived their name, according to Josephus, Eusebius, Jerome, Bede, and most of the interpreters of the sacred writings; but Huet bishop of Avranches, in his Evangelical Demonstration, has attempted to prove, that the Hebrews took their name from the word *heber*, which signifies *beyond*, because they came from beyond the Euphrates. Heber is supposed to have been born 2281 years B. C. and to have lived 464 years.

HEBRAISM, an idiom, or manner of speaking, peculiar.

Hebdome
Hebraism.

Hebrew. peculiar to the Hebrew language. See the next article.

HEBREW, something relating to the Hebrew. See HEBREWS. Thus we say, *HEBREW Bible*. See BIBLE.

HEBREW Character. There are two kinds of Hebrew characters: the ancient, called also the *square*; and the modern, or rabbinical characters.

1. The square Hebrew takes its denomination from the figure of its characters, which stand more square, and have their angles more exact and precise than the other. This character is used in the text of holy scripture, and their other principal and most important writings. When both this and the rabbinical character are used in the same work, the former is for the text, or the fundamental part; and the latter for the accessory part, as the gloss, notes, commentaries, &c.

The best and most beautiful characters of this kind, are those copied from the characters in the Spanish manuscripts; next, those from the Italian manuscripts; then those from the French; and lastly, those of the Germans, whose characters are much the same, with respect to the other genuine square Hebrew characters, that the Gothic or Dutch characters are with respect to the Roman.

Several authors contend, that the square character is not the real ancient Hebrew character, written from the beginning of the language to the time of the Babylonish captivity; but that it is the Assyrian, or Chaldee character, which the Jews assumed, and accustomed themselves to, during the captivity, and retained afterwards. They say, that the Jews, during their captivity, had quite disused their ancient character; so that Ezra found it necessary to have the sacred books transcribed into the Chaldean square character. These authors add, that what we call the Samaritan character, is the genuine ancient Hebrew. Of this opinion are Scaliger, Bochart, Casaubon, Vossius, Grotius, Walton, Capellus, &c. and among the ancients Jerome and Eusebius. On this side it is urged, that the present characters are called Assyrian by the ancient Jewish writers of the Talmud, and therefore must have been brought from Assyria; but to this argument it is replied, that there were two sorts of characters anciently in use, viz. the sacred or present square character, and the profane or civil, which we call Samaritan; and that the sacred is called Assyrian, because it first began in Assyria to come into common use. It is farther alleged, that the Chaldee letters, which the Jews now use, were unknown to the ancient Jews before the captivity, from Dan. i. 4. Moreover, it is inferred from 2 Kings, xvii. 28. whence we learn that a Jewish priest was sent to teach the Samaritans the worship of Jehovah; on which occasion he must have taught them the law; and yet no mention occurs of his teaching them the language or character that the law was then written in, the character which the Samaritans used. But the chief argument is taken from some ancient Jewish shekels, with a legend on one side "The shekel of Israel," and on the other "Jerusalem the holy," both in Samaritan characters. These shekels, it is said, must have been coined before the division of the two kingdoms of Judah and Israel, or at least before the Assyrian captivity, because the Samaritans never afterwards reckoned Jerusalem holy.

On the other side, or for the primitive antiquity of the square character, are the two Buxtorfs, Leusden, Calovius, Hottinger, Spanheim, Lightfoot, &c. They urge, from Matthew v. 18. that *jod* is really the least of the consonants in the present Hebrew, whereas it is one of the largest characters in the Samaritan alphabet: but Walton replies, that if our Saviour here speaks of the least letter of the alphabet, we can only infer, that the Chaldee character was used in our Saviour's time, which is not denied by those who maintain the Samaritan to be the original. They also allege, that the Jews were too obstinate and superstitious to allow their sacred character to be altered; but if this was done under the direction and authority of Ezra, the argument will be much invalidated. Farther, they say that Ezra could not alter the ancient character, because it was impossible to make the alterations in all their copies. This argument, however, is contradicted by fact; since the old English black letter is actually changed for the Roman. They say, likewise, that Ezra was not disposed to profane the sacred writings with a heathen character: but this supposes that Ezra was so superstitious as to imagine, that there was some peculiar sanctity in the shape of the letters. Moreover, the advocates for this opinion appeal to ancient coins found in Judæa, with a legend in the Chaldee or Assyrian character. But the genuineness of these coins is much suspected.

The learned Jesuit Souciet maintains, with great address, that the ancient Hebrew character is that found on the medals of Simon, and others, commonly called *Samaritan medals*; but which, he asserts, were really Hebrew medals, struck by the Jews, and not the Samaritans.

Buxtorf endeavours to reconcile these two opinions, by producing a variety of passages from the rabbies to prove, that both these characters were anciently used; the present square character being that in which the tables of the law, and the copy deposited in the ark, were written; and the other character being used in the copies of the law which were written for private and common use, and in civil affairs in general; and that after the captivity, Ezra enjoined the former to be used by the Jews on all occasions, leaving the latter to the Samaritans and apostates. But it can hardly be allowed by any who consider the difference between the Chaldee and Samaritan characters, with respect to convenience and beauty, that they were ever used at the same time. After all, it is of no great moment which of these, or whether either of them, were the original characters; since it appears, that no change of the words has arisen from the manner of writing them, because the Samaritan and Jewish Pentateuch almost always agree after so many ages. It is most probable that the form of these characters has varied in different periods; this appears from the testimony of Montfaucon, in his *Hexapla Origenis*, vol. i. p. 22. &c. and is implied in Dr Kennicott's making the characters in which manuscripts are written one test of their age.

2. The modern, or rabbinical, is a good neat character, formed of the square Hebrew, by rounding it, and retrenching most of the angles or corners of the letters, to make it the more easy and flowing. The letters used by the Germans are very different from the rabbinical.

Hebrew. rabbinical character used every where else, though all formed alike from the square character, but the German in a more slovenly manner than the rest.—The rabbins frequently make use either of their own, or the square Hebrew character, to write the modern languages in. There are even books in the vulgar tongues printed in Hebrew characters; instances whereof are seen in the French king's library.

HEBREW Language, that spoken by the Hebrews, and wherein the Old Testament is written.

This appears to be the most ancient of all the languages in the world, at least we know of none older; and some learned men are of opinion, that this is the language in which God spoke to Adam in Paradise. Dr Sharpe adopts the opinion that the Hebrew was the original language; not indeed that the Hebrew is the unvaried language of our first parents, but that it was the general language of men at the dispersion; and however it might have been improved and altered from the first speech of our first parents, it was the original of all the languages, or almost all the languages, or rather dialects, that have since arisen in the world.

The books of the Old Testament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of these is extremely sublime: it appears perfectly regular, and particularly so in its conjugations. Indeed, properly speaking, it has but one conjugation; but this is varied in each seven or eight different ways, which has the effect of so many different conjugations, and affords a great variety of expressions to represent by a single word the different modifications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be expressed without a periphrasis.

The primitive words, which are called *roots*, have seldom more than three letters or two syllables.

In this language there are 22 letters, only five of which are usually reckoned vowels, which are the same with ours, viz. *a, e, i, o, u*; but then each vowel is divided into two, a long and a short, the sound of the former being somewhat grave and long, and that of the latter short and acute: it must however be remarked, that the two last vowels have sounds that differ in other respects besides quantity and a greater or less elevation. To these 10 or 12 vowels may be added others, called *semi-vowels*, which serve to connect the consonants, and to make the easier transitions from one to another. The number of accents in this language are indeed prodigious: of these there are near 40, the use of some of which, notwithstanding all the inquiries of the learned, are not yet perfectly known. We know, in general, that they serve to distinguish the sentences like the points called *commas, semicolons, &c.* in our language; to determine the quantity of the syllables; and to mark the tone with which they are to be spoken or sung. It is no wonder, then, that there are more accents in the Hebrew than in other languages, since they perform the office of three different things, which in other languages are called by different names.

As we have no Hebrew but what is contained in the Scripture, that language to us wants a great many

Hebrew. words; not only because in those primitive times the languages were not so copious as at present; but also on this account, that the inspired writers had no occasion to mention many of the terms that might be in the language.

The Chaldee, Syriac, Ethiopic, &c. languages, are by some held to be only dialects of the Hebrew; as the French, Italian, Spanish, &c. are dialects of the Latin. It has been supposed by many very learned men, that the Hebrew characters or letters were often used hieroglyphically, and that each had its several distinct sense understood as a hieroglyphic. Neuman, who seems to have taken infinite pains to find out this secret meaning of these letters, gives the following explication: * *aleph*, he says, is a character denoting motion, readiness, and activity; א *beth*, signifies, 1. Matter, body, substance, thing; 2. Place, space, or capacity; and, 3. In, within, or contained: ג *gimel*, stands for flexion, bending, or obliquity of any kind: ד *daleth*, signifies any protrusion made from without, or any promotion of any kind: ה *he*, stands for presence, or demonstrative essence of any thing: ו *vau*, stands for copulation or growing together of things: ז *zain*, expresses vehement protrusion and violent compression, such as is occasioned by at once violently discharging and constringing a thing together; it also signifies sometimes the straitening of any figure into a narrow point at the end: ח *cheth*, expresses association, society, or any kind of composition or combination of things together: ט *teth*, stands for the withdrawing, drawing back, or recess of any thing: י *jod*, signifies extension and length, whether in matter or in time: כ *caph*, expresses a turning, curvedness, or concavity: ל *lamech*, stands for an addition, access, impulse, or adversation, and sometimes for pressure: מ *mem*, expresses amplitude, or the amplifying any thing in whatever sense; in regard to continuous qualities, it signifies the adding length, breadth, and circumference; and in disjunct qualities it signifies multitude: נ *nun*, signifies the propagation of one thing from another, or of the same thing from one person to another: ס *samech*, expresses cincture and coarctation: ע *ain*, stands for observation, objection, or obviation: פ *pe*, stands for a crookedness or an angle of any figure: צ *tsade*, expresses contiguity and close succession: ק *koph*, expresses a circuit or ambit: ר *resh*, expresses the egress of any thing, as also the exterior part of a thing, and the extremity or end of any thing: ש *shin*, signifies the number three, or the third degree, or the utmost perfection of any thing: ת *tau*, expresses a sequel, continuation, or succession of any thing.

According to this explication, as the several particular letters of the Hebrew alphabet separately signify the ideas of motion, matter, space, and several modifications of matter, space, and motion, it follows, that a language, the words of which are composed of such expressive characters, must necessarily be of all languages the most perfect and expressive, as the words formed of such letters, according to their determinate separate significations, must convey the idea of all the matters contained in the sense of the several characters, and be at once a name and a definition, or succinct description of the subject, and all things material

Hebrew
||
Hebrides.

rial as well as spiritual, all objects in the natural and moral world, must be known as soon as their names are known, and their separate letters considered.

The words *urim* and *thummim* are thus easily explained and found, perhaps the most apposite and expressive words that were ever formed.

Rabbinical, or *modern HEBREW*, is the language used by the rabbins in the writings they have composed. The basis or body hereof is the Hebrew and Chaldee, with divers alterations in the words of these two languages, the meanings whereof they have considerably enlarged and extended. Abundance of things they have borrowed from the Arabic: the rest is chiefly composed of words and expressions, chiefly from the Greek; some from the Latin; and others from the other modern tongues; particularly that spoken in the place where each rabbin lived or wrote.

The rabbinical Hebrew must be allowed to be a very copious language. M. Simon, in his *Hist. Crit. du Vieux Testam.* liv. iii. chap. 27. observes, that there is scarce any art or science but the rabbins have treated thereof in it. They have translated most of the ancient philosophers, mathematicians, astronomers, and physicians; and have written themselves on most subjects: they do not want even orators and poets. Add, that this language, notwithstanding it is so crowded with foreign words, has its beauties visible enough in the works of those who have written well in it.

HEBREWS, the descendants of Heber, commonly called *Jews*. See *HEBER* and *JEWS*.

HEBREWS, or *Epistle to the Hebrews*, a canonical book of the New Testament.

Though St Paul did not prefix his name to this epistle, the concurrent testimony of the best authors ancient and modern afford such evidence of his being the author of it, that the objections to the contrary are of little or no weight.

The Hebrews, to whom this epistle was wrote, were the believing Jews of Palestine; and its design was to convince them, and by their means all the Jewish converts wheresoever dispersed, of the insufficiency and abolishment of the ceremonial and ritual law.

HEBRIDES, the general name of some islands lying to the north-west of Scotland, of which kingdom they constitute a part. They are situated between the 55th and 59th degrees of latitude, are supposed to be about 300 in number, and to contain 48,000 inhabitants. The names of the largest are *SKIE*, *MULL*, *ILAY*, and *ARRAN*. Of these islands Mr Pennant hath given the following history.

"All the accounts left us by the Greek and Roman writers are enveloped with obscurity: at all times brief even in their descriptions of places they had easiest access to, and might have described with the most satisfactory precision; but in remote places, their relations furnish little more than hints, the food for conjecture to the visionary antiquary.

"That Pytheas, a traveller mentioned by Strabo, had visited Great Britain, I would wish to make only *apocryphal*. He asserts that he visited the remoter parts; and that he had also seen Thule, the land of romance amongst the ancients: which all might pretend to have seen; but every voyager, to swell his fame, made the island he saw last the Ultima Thule of his travels. If Pytheas had reached these parts, he might have ob-

served, floating in the seas, multitudes of gelatinous animals, the *medusa* of Linnæus, and out of these have formed his fable. He made his *THULE* a composition of *neither earth, sea, nor air; but like a composition of them all*: then, catching his simile from what floated before him, compares it to the *lungs* of the sea, the Aristotelian idea of these bodies; and from him adopted by naturalists, successors to that great philosopher. Strabo very justly explodes these absurd tales; yet allows him merit in describing the climate of the places he had seen. As a farther proof of his having visited the Hebrides, he mentions their unfriendly sky, that prohibits the growth of the finer fruits; and that the natives are obliged to carry their corn under shelter, to beat the grain out, lest it should be spoiled by the defect of sun and violence of the rains. This is the probable part of his narrative; but when the time that the great geographer wrote is considered, at a period that these islands had been neglected for a very long space by the Romans, and when the difficulties of getting among a fierce and unfriendly nation must be almost insuperable, doubts innumerable respecting the veracity of this relater must arise. All that can be admitted in favour of him is, that he was a great traveller: and that he might have either visited Britain from some of the nations commercing with our isle; or received from them accounts, which he afterwards dressed out, mixed with the ornaments of fable. A traffic must have been carried on with the very northern inhabitants of our islands in the time of Pytheas; for one of the articles of commerce mentioned by Strabo, the ivory bits, were made either of the teeth of the walrus, or of a species of whale native of the northern seas.

"The geographer Mela, who flourished in the reign of Claudius, is the next who takes notice of our lesser islands. He mentions the *Orcades* as consisting of 30; the *Æmodæ* of seven. The Romans had then made a conquest of the former, and might have seen the latter: but, from the words of the historian, it is probable that the *Shetland* islands were those intended; for he informs us, that the "*Æmodæ* were carried out over against Germany:" the site of the Hebrides will not admit this description, which agrees very well with the others; for the ancients extended their Germany, and its imaginary islands, to the extreme north.

"Pliny the elder is the next that mentions these remote places. He lived later than the preceding writers, and of course his information is fuller; by means of intervening discoveries, he has added ten more to the number of the *Orcades*; is the first writer that mentions the *Hœbudes*, the islands in question; and joins in the same line the *Æmodæ*, or, as it is in the best editions more properly written, the *Acmodæ*, or extreme point of the Roman expeditions to the north, as the *Shetland* isles in the highest probability were. Pliny and Mela agree in the number of the *Æmodæ*, or *Acmodæ*: the former makes that of the *Hœbudes* 30; an account extremely near the truth, deducting the little isles, or rather rocks, that surround most of the greater, and many of them so indistinct as scarcely to be remarked, except on an actual survey.

"Solinus succeeds Pliny. If he, as is supposed, was cotemporary with Agricola, he has made very ill use of the light he might have received from the expeditions of that great general: his officers might have

Hebrides. furnished the historian with better materials than those he has communicated. He has reduced the number of the Hœbudes to five. He tells us, that "the inhabitants were unacquainted with corn: that they lived only on fish and milk: that they had one king, as the islands were only separated from each other by narrow straits: that their prince was bound by certain rules of government, to do justice; and was prevented by poverty from deviating from the true course, being supported by the public, and allowed nothing that he could call his own, not even a wife; but then he was allowed free choice, by turns one out of every district, of any female that caught his affection; which deprived him of all ambition about a successor.

"By the number of these islands, and by the minute attention given by the historian to the circumstance of their being separated from each other by very narrow straits, I should imagine, that which is now called the *Long Island*, and includes Lewis, North Uist, Benbecula, South Uist, and Barra, to have been the five Hœbudes of Solinus; for the other great islands, such as Skie, &c. are too remote from each other to form the preceding very characteristic description of that chain of islands. These might naturally fall under the rule of one petty prince; almost the only probable part of Solinus's narrative.

"After a long interval appears Ptolemy, the Egyptian geographer. He also enumerates five Ebudæ; and has given each a name: the Western *Ebuda*, the Eastern, *Ricina*, *Maleos*, *Epidium*. Camden conjectures them to be the modern Skie, Lewis, Rathry or Racline, Mull, and Ilay: and I will not controvert his opinion.

"The Roman historians give very little light into the geography of these parts. Tacitus, from whom most might have been expected, is quite silent about the names of places; notwithstanding he informs us, that a fleet by the command of Agricola performed the circumnavigation of Britain. All that he takes notice of is the discovery and the conquest of the Orkneys: it should seem, that with the biographers of an ambitious nation, nothing seemed worthy of notice but what they could dignify with the glory of victory.

"It is very difficult to assign a reason for the change of name from *Ebudæ* to *Hebrides*: the last is modern; and seems, as the annotator on Dr Macpherson supposes, to have arisen from the error of a transcriber, who changed the *u* into *ri*.

"From all that has been collected from the ancients, it appears, that they were acquainted with little more of the Hebrides than the bare names: it is probable, that the Romans, either from contempt of such barren spots, from the dangers of the seas, the violence of the tides, and horrors of the narrow sounds, in the inexperienced ages of navigation, never attempted their conquest, or saw more of them than what they had in sight during the few circumnavigations of Great Britain, which were expeditions more of ostentation than of utility.

"The inhabitants had probably for some ages their own governors; one little king to each island, or to each groupe, as necessity required. It is reasonable to suppose, that their government was as much divided as that of Great Britain, which, it is well

Nº 150.

known, was under the direction of numbers of petty princes before it was reduced under the power of the Romans.

"No account is given in history of the time these islands were annexed to the government of Scotland. If we may credit our Saxon historians, they appear to have been early under the dominion of the Picts; for Bede and Adamnanus inform us, that soon after the arrival of St Columba in their country, Brude, a Pictish monarch, made the saint a present of the celebrated island of Iona. But neither the holy men of this island, nor the natives of the rest of the Hebrides, enjoyed a permanent repose after this event. The first invasion of the Danes does not seem to be easily ascertained. It appears that they ravaged Ireland, and the isle of Rathry, as early as the year 735. In the following century, their expeditions became more frequent: Harold Harfager, or the *light-haired*, pursued, in 875, several petty princes, whom he had expelled out of Norway; who had taken refuge in the Hebrides, and molested his dominions by perpetual descents from those islands. He seems to have made a rapid conquest: he gained as many victories as he fought battles; he put to death the chief of the pirates, and made an indiscriminate slaughter of their followers. Soon after his return, the islanders repossessed their ancient seats: and, in order to repress their insults, he sent Ketil the *flat-nosed* with a fleet and some forces for that purpose. He soon reduced them to terms, but made his victories subservient to his own ambition: he made alliances with the reguli he had subdued; he formed intermarriages, and confirmed to them their old dominions. This effected, he sent back the fleet to Harold; openly declared himself independent; made himself prince of the Hebrides; and caused them to acknowledge him as such, by the payment of tribute and the badges of vassalage. Ketil remained, during life, master of the islands; and his subjects appear to have been a warlike set of freebooters, ready to join with any adventurers. Thus when Eric, son of Harold Harfager, after being driven out of his own country, made an invasion of England, he put with his fleet into the Hebrides, received a large reinforcement of people fired with the hopes of prey, and then proceeded on his plan of rapine. After the death of Ketil, a kingdom was in aftertimes composed out of them, which, from the residence of the little monarch in the isle of Man, was styled that of *Man*. The islands became tributary to that of Norway for a considerable time, and princes were sent from thence to govern; but at length they again shook off the yoke. Whether the little potentates ruled independent, or whether they put themselves under the protection of the Scottish monarchs, does not clearly appear; but it is reasonable to suppose the last, as Donald-bane is accused of making the Hebrides the price of the assistance given him by the Norwegians against his own subjects. Notwithstanding they might occasionally seek the protection of Scotland, yet they never were without princes of their own: policy alone directed them to the former. From the chronicles of the kings of Man we learn, that they had a succession of princes.

"In 1089 is an evident proof of the independency of the islanders on Norway; for, on the death of Lagman,

man,

Hebrides. nan, one of their monarchs, they sent a deputation to O'Brian king of Ireland, to request a regent of royal blood to govern them during the minority of their young prince. They probably might in turn compliment in some other respects their Scottish neighbours: the islanders must have given them some pretence to sovereignty; for,

"In 1093, Donald-bane, king of Scotland, calls in the assistance of Magnus the Barefooted, king of Norway, and bribes him with the promise of all the islands. Magnus accepts the terms; but at the same time boasts, that he does not come to invade the territories of others, but only to resume the ancient rights of Norway. His conquests are rapid and complete; for, besides the islands, by an ingenious fraud he adds Cantyre to his dominions.

"The Hebrides continued governed by a prince dependent on Norway, a species of viceroy appointed by that court; and who paid, on assuming the dignity, ten marks of gold, and never made any other pecuniary acknowledgment during life: but if another viceroy was appointed, the same sum was exacted from him. These viceroys were sometimes Norwegians, sometimes natives of the isles. In 1097 we find, that Magnus deposes a nobleman of the name of *Inge-mund*: in after times we learn, that natives were appointed to that high office. Thus were the Hebrides governed, from the conquest by Magnus, till the year 1263, when Acho, or Haquin, king of Norway, by an unfortunate invasion of Scotland, terminating in his defeat at Largs, so weakened the powers of his kingdom, that his successor Magnus IV. was content to make a cession of the islands to Alexander III.; but not without stipulating for the payment of a large sum, and of a tribute of 100 merks for ever, which bore the name of the *annual of Norway*. Ample provision was also made by Magnus in the same treaty, for the security of the rights and properties of his Norwegian subjects, who chose to continue in the isles; where many of their posterity remain to this day.

"Notwithstanding this revolution, Scotland seems to have received no real acquisition of strength. The islands still remained governed by powerful chieftains, the descendants of Somerled, thane of Heregaidel, or Argyle, who, marrying the daughter of Olave, king of Man, left a divided dominion to his sons Dugal and Reginald: from the first were descended the Macdougals of Lorn; from the last, the powerful clan of the Macdonalds. The lordship of Argyle, with Mull, and the islands north of it, fell to the share of the first; Ilay, Cantyre, and the southern isles, were the portion of the last: a division that formed the distinction of the Sudereys and Nordereys, (as farther noticed in the article LONA).

"These chieftains were the scourges of the kingdom: they are known in history but as the devastations of a tempest; for their paths were marked with the most barbarous desolation. Encouraged by their distance from the seat of royalty, and the turbulence of the times, which gave their monarchs full employ, they exercised a regal power, and often assumed the title; but are more generally known in history by the style of the *lords of the isles*, or the earls of Ross; and sometimes by that of the *Great Macdonald*.

"Historians are silent about their proceedings,

from the retreat of the Danes, in 1264, till that of 1335, when John, lord of the isles, withdrew his allegiance. In the beginning of the next century his successors were so independent, that Henry IV. entered into a formal alliance with the brothers Donald and John. This encouraged them to commit fresh hostilities against their natural prince. Donald, under pretence of a claim to the earldom of Ross, invaded and made a conquest of that county; but penetrating as far as the shire of Aberdeen, after a fierce but undecided battle with the royal party, thought proper to retire, and in a little time to swear allegiance to his monarch James I. But he was permitted to retain the county of Ross, and assume the title of earl. His successor, Alexander, at the head of 10,000 men, attacked and burnt Inverness; at length, terrified with the preparations made against him, he fell at the royal feet, and obtained pardon as to life, but was committed to strict confinement.

"His kinsman and deputy, Donald Balloch, resenting the imprisonment of his chieftain, excited another rebellion, and destroyed the country with fire and sword: but on his flight was taken and put to death by an Irish chieftain, with whom he sought protection.

"These barbarous inroads were very frequent with a set of banditti, who had no other motive in war but the infamous inducement of plunder.

"In the reign of James II. in the year 1461, Donald, another petty tyrant, an earl of Ross, and lord of the isles, renewed the pretence of independency; surprised the castle of Inverness; forced his way as far as Athol; and obliged the earl and countess, with the principal inhabitants, to seek refuge in the church of St Bridget, in hopes of finding security from his cruelty by the sanctity of the place: but the barbarian and his followers set fire to the church, put the ecclesiastics to the sword, and, with a great booty, carried the earl and countess prisoners to his castle of Claig, in the island of Ilay. In a second expedition, immediately following the first, he suffered the penalty of his impiety: a tempest overtook him, and overwhelmed most of his associates; and he, escaping to Inverness, perished by the hands of an Irish harper: his surviving followers returned to Ilay, conveyed the earl and countess of Athol to the sanctuary they had violated, and expiated their crime by restoring the plunder, and making large donations to the shrine of the offended saint.

"John, successor to the last earl of Ross, entered into alliance with Edward IV. and sent ambassadors to the court of England, where Edward empowered the bishop of Durham and earl of Winchester to conclude a treaty with him, another Donald Balloch, and his son and heir John. They agreed to serve the king with all their power, and to become his subjects: the earl was to have 100 marks sterling for life in time of peace, and 200l. in time of war; and these island allies, in case of the conquest of Scotland, were to have confirmed to them all the possessions benorth of the Scottish sea; and in case of a truce with the Scottish monarch, they were to be included in it. But about the year 1476, Edward, from a change of politics, courted the alliance of James III. and dropt his new allies. James, determined to subdue this rebel-

Hebrides. lious race, sent against them a powerful army under the earl of Athol; and took leave of him with this good wish, *Furth, Fortune, and fill the fetters*; as much as to say, "Go forth, be fortunate, and bring home many captives:" which the family of Athol have used ever since for its motto. Ross was terrified into submission; obtained his pardon; but was deprived of his earldom, which by act of parliament was then declared unalienably annexed to the crown: at the same time the king restored to him Knapdale and Cantyre, which the earl had resigned; and invested him anew with the lordship of the isles, to hold them of the king by service and relief.

"Thus the great power of the isles was broken: yet for a considerable time after, the petty chieftains were continually breaking out into small rebellions, or harassed each other in private wars; and tyranny seems but to have been multiplied. James V. found it necessary to make the voyage of the isles in person in 1536, seized and brought away with him several of the most considerable leaders, and obliged them to find security for their own good behaviour and that of their vassals. The names of these chieftains were (according to Lindesay), *Mydyart, Mac-connel, Mac-loyd, of the Lewis; Mac-niel, Mac-lane, Mac-intosh, John Mudyart, Mac-kay, Mac-kenzie*, and many others: but by the names of some of the above, there seem to have been continental as well as insular malecontents. He examined the titles of their holdings; and finding several to have been usurped, reunited their lands to the crown. In the same voyage he had the glory of causing a survey to be taken of the coasts of Scotland, and of the islands, by his pilot Alexander Lindesay; which were published in 1583, at Paris, by Nicholas de Nicholay geographer to the French monarch.

"The troubles that succeeded the death of James occasioned a neglect of these insulated parts of the Scottish dominions, and left them in a state of anarchy. In 1614, the Mac-donalds made a formidable insurrection, oppugning the royal grant of Cantyre to the earl of Argyle and his relations. The petty chieftains continued in a sort of rebellion; and the sword of the greater, as usual in weak governments, was employed against them: the encouragement and protection given by them to pirates, employed the power of the Campbells during the reign of James VI. and the beginning of that of Charles I. (A).

"But the turbulent spirit of the old times continued even to the present age. The heads of clans were by the divisions, and a false policy that predominated in Scotland during the reign of William III. flattered with an unreal importance: instead of being treated as bad subjects, they were courted as desirable allies: instead of feeling the hand of power, money was allowed to bribe them into the loyalty of the times. They would have accepted the subsidies, notwithstanding they detested the prince that offered them. They were taught to believe themselves of such consequence, that in these days turned to their destruction. Two recent

rebellions gave legislature a late experience of the folly of permitting the feudal system to exist in any part of its dominions. The act of 1748, for abolishing heritable jurisdictions, at once deprived the chieftains of all power of injuring the public by their commotions. Many of these *Reguli* second this effort of legislature, and neglect no opportunity of rendering themselves hateful to their unhappy vassals, the former instruments of their ambition."

"The situation of these islands in the great Atlantic Ocean renders the air cold and moist in the greater part of them. In the most northerly isles the sun, at the summer solstice, is not above an hour under the horizon at midnight, and not longer above it at mid-day in the depth of winter. The soil of the Hebrides varies also in different isles, and in different parts of the same island: some are mountainous and barren, producing little else than heath, wild myrtle, fern, and a little grass; while others, being cultivated and manured with sea-weed, yield plentiful crops of oats and barley.

"Lead mines have been discovered in some of these islands, but not worked to much advantage; others have been found to contain quarries of marble, limestone, and free-stone; nor are they destitute of iron, talc, crystals, and many curious pebbles, some of which emulate the Brazilian topaz.

"With respect to vegetables, over and above the plentiful harvests of corn that the natives earn from agriculture, and the pot-herbs and roots that are planted in gardens for the sustenance of the people, these islands produce spontaneously a variety of plants and simples, used by the islanders in the cure of their diseases; but there is hardly a shrub or tree to be seen, except in a very few spots, where some gentlemen have endeavoured to rear them with much more trouble than success.

"The animals, both of the land and sea, domestic and wild, quadrupeds, fowls, and fishes, found in and about these islands, are of the same species, size, and configuration, with those of the ORKNEYS.

"The people inhabiting these islands are of the same race with those who live in the Highlands of Scotland; speak the same language, wear the same habit, and observe the same customs. [See the article HIGHLANDS.]

"The commodities which may be deemed the staples of this country are black cattle, sheep, and fish, which they sell to their fellow-subjects of Scotland. Part of the wool they work up into knit-socks, coarse cloth, and that variegated stuff called *tartan*. They likewise salt mutton in the hide, and export it in boats or barklings to different parts of the main-land. Cod, ling, mackarel, whiting, haddock, and soles, are here caught in abundance, together with a small red cod, remarkably voracious, of a very delicate flavour: there are likewise two kinds of white fish, which seem to be peculiar to this coast, known by the names of *lithe* and *cea*, esteemed good eating. But the greatest treasure the ocean pours forth is the prodigious quantity of herrings,

(A) In the beginning of the last century the islanders were continually harassing Ireland with their plundering invasions, or landing there to support rebellions: at length it was made treason to receive these Hebridian Redshanks as they were styled.

Hebrides. rings, which, at one season of the year, swarm in all the creeks and bays along the western shore of Scotland. These are counted the largest, fattest, and finest herrings caught in any part of the northern seas. This fishery employs a great number of hands, and brings a considerable advantage to the kingdom. The fish are caught, cured, barrelled up, and exported: but whether from want of skill, or a proper salt for pickling, the Scotch-cured herrings of this coast, though superior to all others in their natural state, are counted inferior to those which are dressed and pickled by the Dutch fishermen.

“How mean and contracted soever the commerce and produce of these islands may be at present, they are perhaps more capable of improvement in both articles than any part of the British dominions in Europe. The inhabitants are so little skilled in husbandry, that the soil, though generally good in the low grounds, yields nothing but scanty crops of oats and barley; and great tracts of land lie altogether uncultivated. If a very small number of judicious farmers would settle in some of the most considerable islands, they would soon raise such harvests as would enrich themselves; employ and maintain all the idle people, a great number of whom are obliged to repair to foreign countries for subsistence; afford sufficient bread for the inhabitants, and even supply the barren parts of the opposite continent. The soil in many places would produce wheat, and almost every where would give good pasturage, insomuch that, with proper culture, the people might provide hay and fodder for their cattle, which during the severity of the winter die in great numbers for want of provision. Improvements of this kind would be the more easily made, as the sea-shore abounds with shells for lime and sea-weeds for manure; and the labourers would be easily subsisted by the fish that swarm not only in the ocean which surrounds these islands, but likewise in the numerous lakes and rivers of fresh water. Martin declares, that he knew 100 families in this country maintained by as many little farms, the rent of each not exceeding 5s. one sheep, and a few pecks of oats.

“The commerce of these islands might be extended in such a manner as to render them a staple of trade, and an excellent nursery for seamen. They are furnished with an infinite number of bays, creeks, and harbours, for the convenience of navigation: the inhabitants are numerous, strong, active, and every way qualified for the life of a mariner. The sea affords myriads of fish for exportation: the lands might afford plenty of pasturage for black cattle, horses, and sheep, as well as plenteous harvests of corn and other grain: woollen and linen manufactures might be prosecuted to great advantage, where labour is cheap and provisions are reasonable. The islands afford good stone and lime; and some parts of the opposite main land, timber for building. They have plenty of fuel, not only for the ordinary purposes of life, but also for salt-pans, which might be erected on different parts of the coast; and for burning sea-ware for the use of a glass or soap manufacture. Finally, the situation of these islands is so commodious for trade, that the navigator is immediately in the open sea, and almost in the neighbourhood of Denmark, Sweden, Hamburgh, Holland; nay, with a favourable wind, he can reach the

coasts of France and Spain in a week's sailing; if he is bound for the British plantations, or indeed for any part of the known globe, he is at once disencumbered of the land, and prosecutes his voyage through the open sea without obstruction or difficulty.”

To the neglected state of these islands, and to their great importance in various natural respects, the attention of government has been called within these few years by the representation and efforts of different patriotic noblemen and gentlemen, and a regular establishment has been formed under the name of the British Society for extending the Fisheries and improving the Sea-coasts of the Kingdom; in consequence of which many useful plans for the improvement of those islands have been adopted, and are gradually carrying into execution.

New HEBRIDES, a cluster of islands lying in the Great South Sea, or Pacific Ocean. The northern islands of this archipelago were first discovered by that great navigator Quiros in 1606, and not without reason considered as a part of the southern continent, which at that time, and till very lately, was supposed to exist. They were next visited by M. de Bougainville in 1768, who, besides landing on the island of Lepers, did no more than discover that the land was not connected, but composed of islands, which he called the *Great Cyclades*. Captain Cook, besides ascertaining the extent and situation of these islands, added the knowledge of several in this group which were before unknown. He explored the whole cluster; and thinking himself thereby intitled to affix to them a general appellation, he named them the *New Hebrides*. They are situated between latitudes of 14 deg. 25. min. and 20 deg. 4 min. south; and between 166 deg. 41 min. and 170 deg. 21 min. east longitude; and extend 125 leagues in the direction of north-north-west and south-south-east. The most northern part of this archipelago was called by M. de Bougainville the *Peak of the Etoile*. The whole cluster consists of the following islands; some of which have received names from the different European navigators; others retain the names which they bear among the natives, viz. *Tierra del Esperitu Santo*, *Mallicollo*, *St Bartholomew*, *Isle of Lepers*, *Aurora*, *Whitsuntide*, *Ambrym*, *Immer*, *Apee*, *Three Hills*, *Sandwich*, *Montagu*, *Hinchinbrook*, *Shepherd*, *Eorramanga*, *Irronan*, *Annatom*, and *Tanna*.

HEBRON (anc. geog.), a very ancient city situated in the hilly country of the tribe of Judah to the south. Its more ancient name was *Kiriath Arba*, or *Cariath Arba*. In antiquity this city vied with the most ancient cities of Egypt, being seven years prior to Zoan, translated *Tanis* by the Seventy. Josephus makes it not only older than Tanis, but even than Memphis. It stood to the west of the lake Asphaltites, and was for some time the royal residence of David. After the captivity it fell into the hands of the Edomites, as did all the south country of Judea. It is now called *Habroun*, situated seven leagues to the south of Bethlehem. The Arabs call it *El-kalil*, “the well beloved;” which is the epithet they usually apply to Abraham, whose sepulchral grotto they still show. Habroun is seated at the foot of an eminence, on which are some wretched ruins, the misshapen remains of an ancient castle. The adjacent country is a sort of oblong hollow, five or six leagues

Hebron
||
Hecatesia.

leagues in length, and not disagreeably varied by rocky hillocks, groves of fir-trees, stunted oaks, and a few plantations of vines and olive trees. These vineyards are not cultivated with a view to make wine, the inhabitants being such zealous Mahometans as not to permit any Christians to live among them: they are only of use to procure dried raisins, which are badly prepared, though the grapes are of an excellent kind. The peasants cultivate cotton likewise, which is spun by their wives, and sold at Jerusalem and Gaza. They have also some soap manufactories, the kali for which is sold them by the Bedouins; and a very ancient glass-house, the only one in Syria. They make there a great quantity of coloured rings, bracelets for the wrists and legs, and for the arms above the elbows, besides a variety of other trinkets, which are sent even to Constantinople. In consequence of these manufactures, Mr Volney informs us, Habroun is the most powerful village in all this quarter; and is able to arm 800 or 900 men, who adhere to the faction Kaifi, and are the perpetual enemies of the people of Bethlehem. This discord, which has prevailed throughout the country from the earliest times of the Arabs, causes a perpetual civil war. The peasants are incessantly making inroads on each other's lands, destroying their corn, dourra, sesamum, and olive trees, and carrying off their sheep, goats, and camels. The Turks, who are every where negligent in repressing similar disorders, are the less attentive to them here, since their authority is very precarious. The Bedouins, whose camps occupy the level country, are continually at open hostilities with them; of which the peasants avail themselves to resist their authority, or do mischief to each other, according to the blind caprice of their ignorance or the interest of the moment. Hence arises an anarchy which is still more dreadful than the despotism which prevails elsewhere, while the mutual devastations of the contending parties render the appearance of this part of Syria more wretched than that of any other.

HEBRUS (anc. geog.), the largest river of Thrace, rising from mount Scombrus; running in two channels till it comes to Philippopolis, where they unite. It empties itself at two mouths into the Ægean Sea, to the north of Samothrace. It was supposed to roll its waters upon golden sands. The head of Orpheus was thrown into it after it had been cut off by the Ciconian women.

HECATE (fab. hist.), a daughter of Perseus and Asteria, the same as Proserpine or Diana. She was called Luna in heaven, Diana on earth, and Hecate or Proserpine in hell; whence her name of *Diva triformis*, *tergemina*, *triceps*. She was supposed to preside over magic and enchantments. She was generally represented like a woman, with the head of a horse, a dog, or a boar; and sometimes she appeared with three different bodies, and three different faces, with one neck. Dogs, lambs, and honey, were generally offered to her, especially in ways and cross roads; whence she obtained the name of *Trivia*. Her power was extended over heaven, the earth, sea, and hell; and to her kings and nations supposed themselves indebted for their prosperity.

HECATESIA, a yearly festival observed by the Stratonicensians in honour of Hecate. The Athenians paid also particular worship to this goddess, who was

deemed the patroness of families and of children. From this circumstance the statues of the goddesses were erected before the doors of the houses; and upon every new moon a public supper was always provided at the expence of the richest people, and set in the streets, where the poorest of the citizens were permitted to retire and feast upon it, while they reported that Hecate had devoured it. There were also expiatory offerings, to supplicate the goddesses to remove whatever evils might impend on the head of the public, &c.

HECATOMB, in antiquity, a sacrifice of an hundred beasts of the same kind, at an hundred altars, and by an hundred priests or sacrificers.--The word is formed of the Greek *εκατομβη*, which properly signifies a sumptuous or magnificent sacrifice.—Others derive it from the Greek *εκατον* *centum*, “a hundred,” and *βους* *bos*, “bullock,” &c.; on which footing the hecatomb should be a sacrifice of 100 bullocks.—Others derive the word from *εκατον* and *πους* *pes*, “foot;” and on that principle hold, that the hecatomb might consist of only 25 four footed beasts. They add, that it did not matter what kind of beasts were chose for victims, provided the quota of feet were but had.

Pythagoras is said to have sacrificed a hecatomb to the muses of 100 oxen, in joy and gratitude for his discovering the demonstration of the 47th proposition of the first book of Euclid, viz. that in a rectangled triangle the square of the hypotenuse is equal to the squares of the two other sides.

For the origin of hecatombs: Strabo relates, that there were 100 cities in Laconia, and that each city used to sacrifice a bullock every year for the common safety of the country; whence the institution of the celebrated sacrifice of 100 victims, called *hecatombs*. Others refer the origin of hecatombs to a plague, where-with the 100 cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to so splendid a sacrifice.

Julius Capitolinus relates, that for a hecatomb they erected 100 altars of turf, and on these sacrificed 100 sheep and 100 hogs. He adds, that when the emperors offered sacrifices of this kind, they sacrificed 100 lions, 100 eagles, and 100 other beasts of the like kind.

HECATOMBÆON was the first month of the Athenian year, consisting of 30 days; beginning on the first new moon after the summer solstice, and consequently answering to the latter part of our June and the beginning of July. It had its name from the great number of hecatombs sacrificed in it. See HECATOMB.

HECATOMPOLIS (anc. geog.), a surname of the island of Crete, from its 100 cities. The territory of Laconia also had anciently this name for the same reason; and the custom of these 100 cities was to sacrifice a hecatomb annually.

HECATOMPYLOS (anc. geog.), the metropolis of Parthia, and royal residence of Arsaces, situated at the springs of the Araxes. Thebes in Egypt had also the same name from its 100 gates.

HECK, an engine to take fish. A salmon heck is a grate for catching that sort of fish.

HECKLE, among hemp-dressers. See HATCHEL.

HECLA, a volcano of Iceland, and one of the most furious in the world, situated on the southern part of island. See ICELAND.

It was visited in the year 1772 by Dr Van Troil, a Swedish

Hecatomb
||
Hecla.

Hecla.

Swedish gentleman, along with Mr (now Sir Joseph) Banks, Dr Solander, and Dr James Lind of Edinburgh. On their first landing they found a tract of land 60 or 70 miles in extent entirely ruined by lava, which appeared to have been in the highest state of liquefaction. Having undertaken a journey to the top of the mountain, they travelled 300 or 360 English miles over an uninterrupted tract of lava; and had at length the pleasure of being the first who had arrived at the summit of the mountain.

Hecla, according to the accounts of these gentlemen, is situated in the southern part of the island, about four miles from the sea-coast, and is divided into three parts at the top, the middle point being the highest; and, according to an exact observation with Ramsden's barometer, is 5000 feet above the level of the sea. They were obliged to quit their horses at the first opening from which the fire had burst. They describe this as a place with lofty glazed walls and high glazed cliffs, unlike any thing which they had ever seen before.

A little higher up they found a large quantity of grit and stones; and still farther on another opening, which, though not deep, descended lower than that of the highest point. Here they imagined they plainly discerned the effects of boiling water; and not far from thence the mountain began to be covered with snow, excepting some spots which were bare. The reason of this difference they soon perceived to be the hot vapour ascending from the mountain. As they ascended higher they found these spots become larger; and about 200 yards below the summit, a hole about a yard and an half in diameter was observed, from whence issued so hot a steam, that they could not measure the degree of heat with the thermometer. The cold now began to be very intense; Fahrenheit's thermometer, which, at the foot of the mountain was at 54, now fell to 24; the wind also became so violent, that they were sometimes obliged to lie down for fear of being blown down the most dreadful precipices. On the very summit they experienced at the same time a high degree of heat and cold; for, in the air, Fahrenheit's thermometer stood constantly at 24, but when set on the ground, rose to 153; the barometer stood at 22.247. Though they were very much inclined to remain here for some time, it could by no means be done with safety; for which reason they were obliged to descend very quickly.

The mountain seems to be made up, not of lava, but of sand, grit, and ashes; which are thrown up with the stones partly discoloured, and partly melted by the fire. Several sorts of pumice stones were found on it, among which was one with some sulphur. Sometimes the pumice was so much burnt, that it was as light as tow. Its form and colour was sometimes very fine, but at the same time so soft, that it was difficult to remove it from one place to another. The common lava was found both in large pieces and small bits; as likewise a quantity of black jasper burned at the extremities, and resembling trees and branches. Some slate of a strong red colour was observed among the stones thrown out by the volcano. In one place the lava had taken the form of chimney-stacks half broken down.—As they descended the mountain they observed three openings. In one, every thing looked as red as brick; from another, the lava had flowed in a stream about 50 yards

broad, and after proceeding for some way, had divided into three large branches. Further on they perceived an opening, at the bottom of which was a mount in form of a sugar-loaf, in throwing up of which the fire appeared to have exhausted itself.

We have already observed, that our travellers were the first who ascended to the top of this mountain. The reason that no one before them had ever done so was partly founded in superstition, and partly the steepness and difficulty of the ascent, which was greatly facilitated by an eruption in 1766. Most kinds of lava found in other volcanic countries are to be met with about Hecla, or other Iceland volcanoes; as the grey, dark perforated kind, similar to the Derbyshire loadstone; the Iceland agate, pumex vitreus both the *niger* and *viridis*. Some have conjectured this to be the lapis obsidianus of the ancients, which they formed into statues.

The lava is seldom found near the openings whence the eruptions proceed, but rather loose grit and ashes; and indeed the greater part of the Icelandic mountains consist of this matter; which, when it is grown cold, generally takes an arched form. The upper crust frequently grows hard and solid, whilst the melted matter beneath it continues liquid. This forms great cavities, whose walls, bed, and roof, are of lava, and where great quantities of stalactite lava are found. There are a vast number of these caves in the island, some of which are very large, and are made use of by the inhabitants for sheltering their cattle. The largest in the island is 5034 feet long, and from 50 to 54 in breadth, and between 34 and 36 in height.—There are some prodigious clefts left by the eruptions, the largest of which is called *Almeneggaa*, near the water of Tingalla, in the southwestern part of the island. It is 105 feet broad and very long. The direction of the chasm itself is from north to south. Its western wall, from which the other has been perpendicularly divided, is 107 feet six inches in height, and consists of many strata, of about 10 inches each in height, of lava grown cold at different times. The eastern wall is only 45 feet four inches in height, and that part of it which is directly opposite to the highest part of the other side is no more than 36 feet 5 inches high.

HECTIC FEVER. See (the *Index* subjoined to) MEDICINE.

HECTOR, the son of Priam and Hecuba, and the father of Astyanax, is celebrated for the valour with which he defended the city of Troy against the Greeks. He was killed by Achilles, who dragged his body, fastened to his chariot, thrice round the walls of Troy, and afterwards restored it to Priam for a large ransom. See TROY.

HEDERA, IVY, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method giving name to the 46th order, *Hederacea*. There are five oblong petals; the berry is pentaspermous, girt by the calyx.

Species. 1. The helix, or common ivy, grows naturally in many parts of Britain; and, where it meets with any support, will rise to a great height, sending out roots on every side, which strike into the joints of walls or the bark of trees. If there is no support, they trail on the ground, and take root all their length, so that they closely cover the surface, and are difficult to eradicate.

Hecla.

Hedera.

Hedges. eradicate. While these stalks are fixed to any support, or trail upon the ground, they are slender and flexible; but when they have reached to the top of their support, they shorten and become woody, forming themselves into large bushy heads, and their leaves are larger, more of an oval shape, and not divided into lobes like the lower leaves, so that it hath a quite different appearance. There are two varieties of this species, one with silver-striped leaves, the other with yellowish leaves on the tops of the branches; and these are sometimes admitted into gardens. 2. The *quinquefolia*, or Virginia creeper, is a native of all the northern parts of America. It was first brought to Europe from Canada; and has been long cultivated in the British gardens, chiefly to plant against walls or buildings to cover them: which these plants will do in a short time; for they will shoot almost 20 feet in one year, and will mount up to the top of the highest building: but as the leaves fall off in autumn, the plants make but an indifferent appearance in winter, and therefore are proper only for such situations as will not admit of better plants; for this will thrive in the midst of cities, and is not injured by smoke or the closeness of the air.

Culture. The first species is easily propagated by its trailing branches, and will thrive in almost any soil or situation. The second may be propagated by cuttings; which if planted in autumn in a shady border will take root, and by the following autumn will be fit to plant in those places where they are designed to remain.

Uses. The roots of the ivy are used by leather-cutters to whet their knives upon. Apricots and peaches covered with ivy during the month of February, have been observed to bear fruit plentifully. The leaves have a nauseous taste; Haller says, they are given to children in Germany as a specific for the atrophy. The common people of England apply them to issues; and an ointment made from them is in great esteem among the Highlanders of Scotland as a ready cure for burns. The berries have a little acidity. When fully ripe, a dose of them has been recommended in the plague. In warm climates, a resinous juice exudes from the stalks, which is said to be a powerful resolvent and discutient, and an excellent ingredient in plasters and ointments adopted for those purposes. Horses and sheep eat the plant; goats and cows refuse it.—Caspar Bauhine and Tournefort mention a sort of ivy that grows in many of the islands of the Archipelago, to which they have given the name of the *poet's ivy*, because the ancients are said to have made crowns of this plant for adorning the brows of their poets. By others it is called *hedera dionysias*, because they made use of the same sort of ivy in their public rejoicings and feasts in honour of Bacchus. The berries are of a fine gold colour, whence this species has been termed by others *chrysocarpus*.

HEDERACEÆ, (from *hedera* "ivy.") The name of the 46th order in Linnæus's fragments of a natural method, consisting of ivy, and a few other genera, which from their general habit and appearance seem nearly allied to it. See BOTANY, p. 468.

HEDGES, in agriculture, are either planted to make fences round inclosures, or to divide the several parts of a garden. When they are designed as out-

ward fences, they are planted either with hawthorn, crabs, or black-thorn: but those hedges which are planted in gardens, either to surround wilderness-quarters, or to screen the other parts of a garden from sight, are planted according to the fancy of the owner; some preferring ever-greens, in which case the holly is best; next the yew, then the laurel, *laurustinus*, *phillyrea*, &c. Others prefer the beech, the hornbeam, and the elm.

Before planting, it is proper to consider the nature of the land, and what sort of plants will thrive best in it; and also, what is the soil from whence the plants are to be taken. As for the size, the sets ought to be about the thickness of one's little finger, and cut within about four or five inches of the ground; they ought to be fresh taken up, straight, smooth, and well-rooted. Those plants that are raised in the nursery are to be preferred.

In planting outside hedges, the turf is to be laid, with the grass-side downwards, on that side of the ditch the bank is designed to be made; and some of the best mould should be laid upon it to bed the quick, which is to be set upon it a foot asunder. When the first row of quick is set, it must be covered with mould; and when the bank is a foot high, you may lay another row of sets against the spaces of the former, and cover them as you did the others: the bank is then to be topped with the bottom of the ditch, and a dry or dead-hedge laid, to shade and defend the under-plantation. Stakes should then be driven into the loose earth, so low as to reach the firm ground: these are to be placed at about two feet and a half distance: and in order to render the hedge yet stronger, you may edder it, that is, bind the top of the stakes with small long poles, and when the eddering is finished, drive the stakes anew.

The quick must be kept constantly weeded, and secured from being cropped by cattle; and in February it will be proper to cut it within an inch of the ground, which will cause it strike root afresh, and help it much in the growth.

The crab is frequently planted for hedges; and if the plants are raised from the kernels of the small wild crabs, they are much to be preferred to those raised from the kernels of all sorts of apples without distinction; because the plants of the true small crab never shoot so strong as those of the apples, and may therefore be better kept within the proper compass of an hedge.

The black-thorn, or sloe, is frequently planted for hedges: and the best method of doing it, is to raise the plants from the stones of the fruit, which should be sown about the middle of January, if the weather will permit, in the place where the hedge is intended; but when they are kept longer out of the ground, it will be proper to mix them with sand, and keep them in a cool place. The same fence will do for it when sown, as when it is planted.

The holly is sometimes planted for hedges; but where it is exposed, there will be great difficulty in preventing its being destroyed: otherwise, it is by far the most beautiful plant; and, being an ever-green, will afford much better shelter for cattle in winter than any other sort of hedge. The best method of raising these hedges, is to sow the stones in the place where the hedge

4 Black thorn.

5 Holly.

Hedges. hedge is intended; and, where this can be conveniently done, the plants will make a much better progress than those that are transplanted: but these berries should be buried in the ground several months before they are sown. The way to do this, is to gather the berries about Christmas, when they are usually ripe, and put them into large flower-pots, mixing some sand with them; then dig holes in the ground, into which the pots must be sunk, covering them over with earth, about ten inches thick. In this place they must remain till the following October, when they should be taken up, and sown in the place where the hedge is intended to be made. The ground should be well trenched, and cleared from the roots of all bad weeds, bushes, trees, &c. Then two drills should be made, at about a foot distance from each other, and about two inches deep, into which the seeds should be scattered pretty close, lest some should fail. When the plants grow up, they must be carefully weeded: and if they are designed to be kept very neat, they should be cut twice a year, that is in May and in August; but if they are only designed for fences, they need only be sheered in July. The fences for these hedges, while young, should admit as much free air as possible: the best sort are those made with posts and rails, or with ropes drawn through holes made in the posts; and if the ropes are painted over with a composition of melted pitch, brown Spanish colour and oil, well mixed, they will last several years.

6
Of garden
hedges.

Hedges for ornament in gardens are sometimes planted with ever-greens, in which case the holly is preferable to any other: next to this, most people prefer the yew; but the dead colour of its leaves renders those hedges less agreeable. The laurel is one of the most beautiful ever-greens; but the shoots are so luxuriant that it is difficult to keep it in any tolerable shape; and as the leaves are large, to prevent the disagreeable appearance given them by their being cut through with the sheers, it will be the best way to prune them with a knife, cutting the shoots just down to a leaf. The laurustinus is a very fine plant for this purpose; but the same objection may be made to this as to the laurel: this, therefore, ought only to be pruned with a knife in April, when the flowers are going off; but the new shoots of the same spring must by no means be shortened. The small-leaved and rough-leaved laurustinus are the best plants for this purpose. The true phillyrea is the next best plant for hedges, which may be led up to the height of 10 or 12 feet; and if they are kept narrow at the top, that there may be not too much width for the snow to lodge upon them, they will be close and thick, and make a fine appearance. The ilex, or ever-green oak, is also planted for hedges, and is a fit plant for those designed to grow very tall.—The deciduous plants usually planted to form hedges in gardens are, The hornbeam, which may be kept neat with less trouble than most other plants. The beech, which has the same good qualities as the hornbeam; but the gradual falling of its leaves in winter causes a continual litter. The small-leaved English elm is a proper tree for tall hedges, but these should not be planted closer than eight or ten feet. The lime-tree has also been recommended for the same purpose; but after they have stood some years, they grow very thin at bottom, and

their leaves frequently turn of a black disagreeable colour.

Many of the flowering shrubs have also been planted in hedges, such as roses, honeysuckles, sweet briar, &c. but these are difficult to train; and if they are cut to bring them within compass, their flowers, which are their greatest beauty, will be entirely destroyed. A correspondent of the society for improving agriculture in Scotland, however, informs us, that he tried with success the eglantine, sweet-briar, or dog-rose, when all the methods of making hedges practised in Essex and Hampshire had been tried in vain. His method was to gather the hips of this plant, and to lay them in a tub till March: the seeds were then easily rubbed out; after which they were sowed in a piece of ground prepared for garden peas. Next year they came up; and the year after they were planted in the following manner. After marking out the ditch, the plants were laid about 18 inches asunder upon the side grass, and their roots covered with the first turfs that were taken off from the surface of the intended ditch. The earth side of these turfs was placed next to the roots, and other earth laid upon the turfs which had been taken out of the ditch. In four or five years these plants made a fence which neither horses nor cattle of any kind could pass. Even in two or three years none of the larger cattle will attempt a fence of this kind. Sheep indeed will sometimes do so, but they are always entangled to such a degree, that they would remain there till they died unless relieved. Old briars dug up and planted soon make an excellent fence; and, where thin, it may be easily thickened by laying down branches, which in one year will make shoots of six or seven feet. They bear clipping very well.

Dr Anderson, who hath treated the subject of hedges very particularly, is of opinion, that some other plants besides those abovementioned might be usefully employed in the construction of hedges. Among these he reckons the common willow. This, he says, by no means requires the wetness of soil which is commonly supposed. "It is generally imagined (says he), that the willow can be made to thrive no where except in wet or boggy ground: but this is one of those vulgar errors, founded upon inaccurate observation, too often to be met with in subjects relating to rural affairs; for experience has sufficiently convinced me, that this plant will not only grow, but thrive, in any rich well-cultivated soil (unless in particular circumstances that need not here be mentioned), even although it be of a very dry nature. It could not, however, in general be made to thrive, if planted in the same manner as thorns; nor would it, in any respect, be proper to train it up for a fence in the same way as that plant. The willow, as a fence, could seldom be successfully employed, but for dividing into separate inclosures any extensive field of rich ground: and, as it is always necessary to put the soil into as good order as possible before a hedge of this kind is planted in it, the easiest method of putting it into the necessary high tilth, will be to mark off the boundaries of your several fields in the winter, or early in the spring, with a design to give a complete fallow to a narrow ridge, six or eight feet broad, in the middle of which the hedge is intended to be planted the ensuing winter. This ridge ought to be frequently ploughed during the summer-season, and

Of the willow.

Hedges. and in autumn to be well manured with dung or lime, or both (for it cannot be made too rich), and be neatly formed into a ridge before winter.

“ Having prepared the ground in this manner, it will be in readiness to receive the hedge, which ought to be planted as early in winter as can be got conveniently done; as the willow is much hurt by being planted late in the spring. But before you begin to make a fence of this kind, it will be necessary to provide a sufficient number of plants: which will be best done by previously rearing them in a nursery of your own, as near the field to be inclosed as you can conveniently have it; for as they are very bulky, the carriage of them would be troublesome if they were brought from any considerable distance. The best kinds of willow for this use, are such as make the longest and strongest shoots, and are not of a brittle nature. All the large kinds of hoop-willows may be employed for this use; but there is another kind with stronger and more taper shoots, covered with a dark green bark when young, which, upon the older shoots, becomes of an ash-gray, of a firm texture, and a little rough to the touch. The leaves are not so long, and a great deal broader than those of the common hoop-willow, pretty thick, and of a dark green colour. What name this species is usually known by, I cannot tell; but as it becomes very quickly of a large size at the root, and is strong and firm, it ought to be made choice of for this purpose in preference to all other kinds that I have seen. The shoots ought to be of two or three years growth before they can be properly used, and should never be less than eight or nine feet in length. These ought to be cut over close by the ground immediately before planting, and carried to the field at their whole length. The planter having stretched a line along the middle of the ridge which was prepared for their reception, begins at one end thereof, thrusting a row of these plants firmly into the ground, close by the side of the line, at the distance of 18 or 20 inches from one another; making them all slant a little to one side in a direction parallel to the line. This being finished, let him begin at the opposite end of the line, and plant another row in the intervals between the plants of the former row; making these incline as much as the others, but in a direction exactly contrary; and then, plaiting these basket-ways, work them into lozenges like a net, fastening the tops by plaiting the small twigs with one another, which with very little trouble may be made to bind together very firmly. The whole, when finished, assumes a very beautiful net-like appearance, and is even at first a tolerable good defence: and, as these plants immediately take root and quickly increase in size, it becomes, after a few years, a very strong fence which nothing can penetrate. This kind of hedge I myself have employed; and find that a man may plant and twist properly about a hundred yards in a day, if the plants be laid down to his hand: and, in a situation such as I have described, I know no kind of fence which could be reared at such a small expence, so quickly become a defence, and continue so long in good order. But it will be greatly improved by putting a plant of eglantine between each two plants of willow, which will quickly climb up and be supported by them; and, by its numerous prickles would effectually

N^o 150.

ally preserve the defenceless willow from being browsed upon by cattle. **Hedges.**

“ As it will be necessary to keep the narrow ridge, upon which the hedge is planted, in culture for one year at least, that the plants of eglantine may not be choked by weeds, and that the roots of the willow may be allowed to spread with the greater ease in the tender mold produced by this means, it will be proper to stir the earth once or twice by a gentle horse hoe in the beginning of summer; and, in the month of June, it may be sowed with turnips, or planted with coleworts, which will abundantly repay the expence of the fallow.”

The same author also gives the following useful directions for planting hedges in situations very much exposed to the weather, and recovering them when on the point of decaying. “ Those who live in an open uncultivated country, have many difficulties to encounter, which others who inhabit more warm and sheltered regions never experience; and, among these difficulties, may be reckoned that of hardly getting hedges to grow with facility. For, where a young hedge is much exposed to violent and continued gusts of wind, no art will ever make it rise with so much freedom, or grow with such luxuriance, as it would do in a more sheltered situation and favourable exposure.

“ But although it is impossible to rear hedges in this situation to so much perfection as in the others, yet they may be reared even there, with a little attention and pains, so as to become very fine fences.

“ It is advisable in all cases, to plant the hedges upon the face of a bank; but it becomes absolutely necessary in such an exposed situation as that I have now described: for the bank, by breaking the force of the wind, screens the young hedge from the violence of the blast, and allows it to advance, for some time at first, with much greater luxuriance than it otherwise could have done.

“ But as it may be expected soon to grow as high as the bank, it behoves the provident husbandman to prepare for that event, and guard, with a wise forecast, against the inconvenience that may be expected to arise from that circumstance.

“ With this view, it will be proper for him, instead of making a single ditch, and planting one hedge, to raise a pretty high bank, with a ditch on each side of it, and a hedge on each face of the bank; in which situation, the bank will equally shelter each of the two hedges while they are lower than it; and, when they at length become as high as the bank, the one hedge will in a manner afford shelter to the other, so as to enable them to advance with much greater luxuriance than either of them would have done singly.

“ To effectuate this still more perfectly, let a row of service-trees be planted along the top of the bank, at the distance of 18 inches from each other, with a plant of eglantine between each two services. This plant will advance, in some degree, even in this exposed situation; and by its numerous shoots, covered with large leaves, will effectually screen the hedge on each side of it, which, in its turn, will receive some support and shelter from them; so that they will be enabled to advance all together, and form, in time, a close, strong, and beautiful fence.

“ The *service* is a tree but little known in Scotland; although

Hedges. although it is one of those that ought perhaps to be often cultivated there in preference to any other tree whatever, as it is more hardy, and, in an exposed situation, affords more shelter to other plants than almost any other tree I know: for it sends out a great many strong branches from the under part of the stem, which, in time, assume an upright direction, and continue to advance with vigour, and carry many leaves to the very bottom, almost as long as the tree exists; so that if it is not pruned, it rises a large close bush, till it attains the height of a forest tree.

"It is of the same genus with the rawn-tree—and has a great resemblance to it both in flower and fruit; its branches are more waving and pliant—its leaves undivided, broad and round, somewhat resembling the elm, but white and mealy on the under side. It deserves to be better known than it is at present.

"But if, from the poorness of the soil in which your hedge is planted, or from any other cause, it should so happen, that, after a few years, the hedge becomes sickly, and the plants turn poor and stunted in appearance, the easiest and only effectual remedy for that disease, is to cut the stems of the plants clean over, at the height of an inch or two above the ground; after which they will send forth much stronger shoots than they ever would have done without this operation. And if the hedge be kept free of weeds, and trained afterwards in the manner above described, it will, in almost every case, be recovered, and rendered fresh and vigorous.

"This amputation ought to be performed in autumn, or the beginning of winter; and in the spring, when the young buds begin to show themselves, the stumps ought to be examined with care, and all the buds be rubbed off, excepting one or two of the strongest and best placed, which should be left for a stem. For if the numerous buds that spring forth round the stem are allowed to spring up undisturbed, they will become in a few years as weak and stunted as before; and the hedge will never afterwards be able to attain any considerable height, strength, or healthfulness.—I have seen many hedges, that have been repeatedly cut over, totally ruined by this circumstance not having been attended to in proper time.

"If the ground for 16 or 20 feet on each side of the hedge be fallowed at the time that this operation is performed, and get a thorough dressing with rich manures, and be kept in high order for some years afterwards by good culture and meliorating crops, the hedge will prosper much better than if this had been omitted, especially if it has been planted on the level ground, or on the bank of a shallow ditch."

II
Of the black alder. Mr Miller greatly recommends the black alder as superior to any other that can be employed in moist soils. It may either be propagated by layers or truncheons about three feet long. The best time for planting these last is in February or the month of March. They ought to be sharpened at their largest end, and the ground well loosened before they are thrust into it, lest the bark should be torn off, which might occasion their miscarriage. They should be set at least two feet deep, to prevent their being blown out of the ground by violent winds after they have made strong shoots; and they should be kept clear of tall weeds until they have got good heads, after which

they will require no farther care. When raised by laying down the branches, it ought to be done in the month of October; and by that time twelvemonth they will have roots sufficient for transplantation, which must be done by digging a hole and loosening the earth in the place where the plant is to stand. The young sets must be planted at least a foot and an half deep; and their top should be cut off to within about nine inches of the ground; by which means they will shoot out many branches. This tree may be trained into very thick and close hedges, to the height of 20 feet and upwards. It will thrive exceedingly on the sides of brooks; for it grows best when part of its roots are in water; and may, if planted there, as is usual for willows, be cut for poles every fifth or sixth year. Its wood makes excellent pipes and staves; for it will last a long time underground or in water: and it is likewise in great estimation among ploughwrights, turners, &c as well as for making several of the utensils necessary for agriculture. Its bark also dies a good black.

12
The birch is another tree recommended by Mr Miller as proper for hedges; and in places where the birch. young plants can be easily procured, he says that the plantation of an acre will not cost 40 shillings, the after expence will not exceed 20 shillings: so that the whole will not come above three pounds. Ash-trees ought never to be permitted in hedges, both because they injure the corn and grass by their wide extended roots, and likewise on account of the property their leaves have of giving a rank taste to butter made from the milk of such cattle as feed upon the leaves. No ash-trees are permitted to grow in the good dairy-counties.

13
Where there are plenty of rough flat stones, the Of hedges fences which bound an estate or farm are frequently raised on made with them. In Devonshire and Cornwall it is the top of common to build as it were two walls with these stones stone-fences. laid upon one another; first two and then one between: as the walls rise they fill the intermediate space with earth, beat the stones in flat to the sides, which makes them lie very firm, and so proceed till the whole is raised to the intended height. Quick hedges, and even large timber trees, are planted upon these walls, and thrive extremely well. Such inclosures are reckoned the best defence that can be had for the ground and cattle; though it can scarce be supposed but they must be disagreeable to the eye, and stand in need of frequent repairs by the stones being forced out of the way by cattle. The best way to prevent this is to build such wall in the bottom of a ditch made wide enough on purpose, and sloped down on each side. Thus the deformity will be hid; and as the cattle cannot stand to face the wall so as to attempt to leap over it, the stones of which it is composed will be less liable to be beaten down. The earth taken out of the ditch may be spread on the adjacent ground, and its sides planted with such trees or underwood as will best suit the soil. By leaving a space of several feet on the inside for timber, a supply of that valuable commodity may be had without doing any injury to the more valuable pasture.

14
The following is an excellent method of making a durable and beautiful fence in grassy places. Dig pieces of turf four or five inches thick, the breadth of grassy places the

Hedges.

the spade, and about a foot in length. Lay these turfs even by a line on one side, with the grass outward, at the distance of ten or twelve inches within the mark at which the ditch afterwards to be dug in the solid ground is to begin. Then lay, in the same manner, but with their grass sides turned out the contrary way, another row of turf, at such a distance as to make a breadth of foundation proportioned to the intended height of the bank. Thus, even though the ground should prove defective, the bank would be prevented from giving way. A ditch may then be dug of what depth and breadth you please; or the ground may be lowered with a slope on each side; and in this case there will be no loss of pasture by the fence; because it may be sowed with hay-seeds, and will bear grass on both sides. Part of the earth taken out of the ditches or slopes will fill the chasm between the rows of turf, and the rest may be scattered over the adjacent ground. Three, four, or more layers of turf, may be thus placed upon one another, and the interval between them filled up as before till the bank is brought to its desired height; only observing to give each side of it a gentle slope for greater strength. The top of this bank should be about two feet and a half wide, and the whole of it filled up with earth except a small hollow in the middle to retain some rain. Quicksets should then be planted along this top, and they will soon form an admirable hedge. By this means a bank four feet high, and a slope only two feet deep, will make, besides the hedge, a fence six feet high, through which no cattle will be able to force their way: for the roots of the grass will bind the turf so together, that in one year's time it will become entirely solid; and it will yet be much stronger when the roots of the quick shall have shot out among it. The only precautions necessary to be observed in making this bank are, 1. Not to make it when the ground is too dry; because, if a great deal of wet should suddenly follow, it will swell the earth so much as perhaps to endanger the falling of some of the outside; which, however, is easily remedied if it should happen. 2. If the slope be such as sheep can climb up, secure the young quicks, at the time of planting them, by a small dead hedge, either on or near the top, on both sides. If any of the quicks should die, which they will hardly be more apt to do in this than in any other situation, unless perhaps in extremely dry seasons, they may be renewed by some of the methods already mentioned.—Such fences will answer even for a park; especially if we place posts and rails, about two feet high, a little sloping over the side of the bank, on or near its top: no deer can creep through this, nor even be able to jump over it. It is likewise one of the best fences for securing cattle; and if the quicks on the bank be kept clipped, it will form a kind of green wall pleasing to the eye.

15
Elms recommended.

In the first volume of the Bath Papers we find elms recommended for fences; and the following method of raising them for this purpose is said to be the best. When elm timber is felled in the spring, sow the chips made in trimming or hewing them green, on a piece of ground newly ploughed, as you would corn, and harrow them in. Every chip which has an eye, or bud-knot, or some bark on it, will immediately shoot like the cuttings of potatoes; and the plants thus

raised having no tap-roots, but shooting their fibres horizontally in the richest part of the soil, will be more vigorous, and may be more safely and easily transplanted, than when raised from seeds, or in any other method. The plants thus raised for elm fences have greatly the advantage of others; as five, six, and sometimes more, stems will arise from the same chip; and such plants, if cut down within three inches of the ground, will multiply their side shoots in proportion, and make a hedge thicker, without running to naked wood, than by any other method yet practised. If kept clipped for three or four years, they will be almost impenetrable.

In the second volume of the same work, we meet with several observations on quick-hedges by a gentleman near Bridgewater. He prefers the white and black thorns to all other plants for this purpose; but is of opinion, that planting timber-trees in them at proper intervals is a very eligible and proper method. He raised some of his plants from haws in a nursery; others he drew up in the woods, or wherever they could be found. His banks were made flat, and three feet wide at the top, with a sloping side next the ditches, which last were dug only two feet below the surface, and one foot wide at bottom. The turfs were regularly laid, with the grass downwards, on that side of the ditch on which the hedge was to be raised, and the best of the mould laid at top. The sets were straight, long, smooth, and even growing ones, planted as soon as possible after taking up. They were planted at a foot distance; and about every 40 feet young fruit-trees or those of other kinds, such as ash, oak, elm, beech, as the soil suited them. A second row of quicksets were then laid on another bed of fresh earth at the same time, and covered with good mould; after which the bank was finished and secured properly from injuries by a dead hedge well wrought together, and fastened by stakes of oak-trees on the top of the bank at three feet distance. Wherever any of the quicksets had failed or were of a dwindling appearance, he had them replaced with fresh ones from the nursery; as well as such of the young trees as had been planted on the top of the bank, and cleared the whole from weeds. Those most destructive to young hedges are the white and black bryony, bindweed, and the traveller's joy. The root of white bryony is as big as a man's leg, and runs very deep: that of black bryony often grows to 30 feet long, and with a kind of tendrils takes hold of the root of the young quick, and chokes it. This root must be dug very deep in order to destroy it. The third is still more destructive to young quicks than the other two, overshadowing the hedge like an arbour. Its root is smaller than that of the two former, but must be dug out very clean, as the least piece left will send up fresh shoots. It is very destructive to hedges to allow cattle to browse upon them, which they are very apt to do; but where cattle of some kind must be allowed access to them, horses will do by far the least mischief.

With regard to the advantage arising from hedges, our author observes, that "if they were of no farther use than as mere fences, it would be the farmer's interest to keep them up carefully; for the better they are, the more secure are his cattle and crops. But if a judicious mixture of cider fruit-trees were planted in hedges,

Hedges.

16

Observations on quick-hedges.

17

Cider fruit-trees recommended in hedges.

Hedges. hedges, the profit arising from them only would abundantly repay the cost of the whole without any loss of ground. It may possibly be objected by some, that the hedges would often be hurt by the boys climbing up to get the fruit: but those who make it should remember, or be told, that the best kinds of cider-fruit are so hard and austere at the time of their being gathered, that nobody can eat them, and even hogs will hardly touch them. But the greatest benefit, where no fruit-trees are planted, arises from the thorns and wood which quick hedges yield for the fire and other purposes."

18
Method of
raising
hornbeam
hedges in
Germany.

The author of the Essays on Husbandry recommends the hornbeam plant as one of the best yet known for making fences, according to the method practised in Germany, where such fences are common. "When the German husbandman (says he) erects a fence of this nature, he throws up a parapet of earth, with a ditch on each side, and plants his hornbeam sets in such a manner, that every two plants may be brought to intersect each other in the form of St Andrew's crosses. In that part where the two plants cross each other, he gently scrapes off the bark, and binds them with straw thwart-wise. Here the two plants consolidate in a kind of indissoluble knot, and push from thence horizontal slanting shoots, which form a sort of living palisado or *Chevaux de frise*; so that such a protection may be called a rural fortification. The hedges being pruned annually, and with discretion, will in a few years render the fence impenetrable in every part.

19
Dr Anderson's
method of
mending
decayed
hedges.

"It sometimes happens (says Dr Anderson) that a hedge may have been long neglected, and be in general in a healthy state, but full of gaps and openings, or so thin and straggling, as to form but a very imperfect sort of fence. On these occasions, it is in vain to hope to fill up the gaps by planting young quicks; for these would always be outgrown, choaked, and starved, by the old plants: nor could it be recovered by cutting clear over by the roots, as the gaps would still continue where they formerly were. The only methods that I know of rendering this a fence are, either to mend up the gaps with dead wood, or to *plash* the hedge; which last operation is always the most eligible where the gaps are not too large to admit of being cured by this means.

"The operation I here call *plashing*, may be defined, 'a wattling made of living wood.' To form this, some stems are first selected, to be left as stakes at proper distances, the tops of which are all cut over at the height of four feet from the root. The straggling side-branches of the other part of the hedge are also lopped away. Several of the remaining plants are then cut over, close by the ground, at convenient distances; and the remaining plants are cut perhaps half through, so as to permit them to be bent to one side. They are then bent down almost to a horizontal position, and interwoven with the upright stakes, so as to retain them in that position. Care ought to be taken, that these be laid very low at those places where there were formerly gaps; which ought to be farther strengthened by some dead stakes or truncheons of willows, which will frequently take root in this case, and continue to live. And sometimes a plant of eglantine will be able to overcome the difficulties it there meets with, strike

root, and grow up so as to strengthen the hedge in a most effectual manner.

Hedges.

"The operator begins at one end of the field, and proceeds regularly forward, bending all the stems in one direction, so that the points rise above the roots of the others, till the whole wattling is completed, to the same height as the uprights.

"An expert operator will perform this work with much greater expedition than one who has not seen it done could easily imagine. And as all the diagonal wattlings continue to live and send out shoots from many parts of their stems, and as the upright shoots that rise from the stumps of those plants that have been cut over quickly rush up through the whole hedge, these serve to unite the whole into one entire mass, that forms a strong, durable, and beautiful fence.

"This is the best method of recovering an old neglected hedge that hath as yet come to my knowledge.

"In some cases it happens that the young shoots of a hedge are killed every winter; in which case it soon becomes dead and unsightly, and can never rise to any considerable height. A remedy for this disease may therefore be wished for.

"Young hedges are observed to be chiefly affected with this disorder; and it is almost always occasioned by an injudicious management of the hedge, by means of which it has been forced to send out too great a number of shoots in summer, that are thus rendered so small and weakly as to be unable to resist the severe weather in winter.

"It often happens that the owner of a young hedge, with a view to render it very thick and close, cuts it over with the shears a few inches above the ground the first winter after planting; in consequence of which, many small shoots spring out from each of the stems that has been cut over:—Each of which, being afterwards cut over in the same manner, sends forth a still greater number of shoots, which are smaller and smaller in proportion to their number.

"If the soil in which the hedge has been planted is poor, in consequence of this management, the branches, after a few years, become so numerous, that the hedge is unable to send out any shoots at all, and the utmost exertion of the vegetative powers enables it only to put forth leaves. These leaves are renewed in a sickly state for some years, and at last cease to grow at all—the branches become covered with fog, and the hedge perishes entirely.

"But if the soil be very rich, notwithstanding this great multiplication of the stems, the roots will still have sufficient vigour to force out a great many small shoots, which advance to a great length, but never attain a proportional thickness. And as the vigour of the hedge makes them continue to vegetate very late in autumn, the frosts come on before the tops of these dangling shoots have attained any degree of woody firmness, so that they are killed almost entirely by it: the whole hedge becomes covered with these long dead shoots, which are always disagreeable to look at, and usually indicate the approaching end of the hedge.

"The causes of the disorder being thus explained, it will readily occur, that the only radical cure is amputation; which, by giving an opportunity to begin

Hedges. with training the hedge anew, gives also an opportunity of avoiding the errors that occasioned it. In this case, care ought to be taken to cut the plants as close to the ground as possible, as there the stems will be less numerous than at any greater height. And particular attention ought to be had to allow very few shoots to arise from the stems that have been cut over, and to guard carefully against shortening them.

"But as the roots, in the case here supposed, will be very strong, the shoots that are allowed to spring from the stems will be very vigorous, and there will be some danger of their continuing to grow later in the season than they ought in safety to do; in which case, some part of the top of the shoot may perhaps be killed the first winter, which ought if possible to be prevented. This can only be effectually done by giving a check to the vegetation in autumn, so as to allow the young shoots to harden in the points before the winter approaches. If any of the leaves or branches of a tree are cut away while it is in the state of vegetation, the whole plant feels the loss, and it suffers a temporary check in its growth in proportion to the loss that it thus sustains. To check, therefore, the vigorous vegetation at the end of autumn, it will be prudent to choose the beginning of September for the time of lopping off all the supernumerary branches from the young hedge, and for clipping off the side-branches that have sprung out from it; which will, in general, be sufficient to give it such a check in its growth at that season, as will prevent any of the shoots from advancing afterwards. If the hedge is extremely vigorous, a few buds may be allowed to grow upon the large stumps in the spring, with a view to be cut off at this season, which will tend to stop the vegetation of the hedge still more effectually.

"By this mode of management, the hedge may be preserved entire through the first winter. And as the shoots become less vigorous every successive season, there will be less difficulty in preserving them at any future period. It will always be proper, however, to trim the sides of a very vigorous hedge for some years while it is young, about the same season of the year, which will tend powerfully to prevent this malady. But when the hedge has advanced to any considerable height, it will be equally proper to clip it during any of the winter-months, before Candlemas."

Lord
Kames's
observa-
tions.

21

Fence for a
deer-park.

Lord Kames, in his work intitled the Gentleman Farmer, gives several directions for the raising and mending of hedges considerably different from those above related. For a deer-park he recommends a wall of stone coped with turf, having laburnums planted close to it. The heads of the plants are to be lopped off, in order to make the branches extend laterally, and interweave in the form of a hedge. The wall will prevent the deer from breaking through; and if the hedge be trained eight feet high, they will not attempt to leap over. He prefers the laburnum plant, because no beast will feed upon it except a hare, and that only when young and the bush tender. Therefore, no extraordinary care is necessary except to preserve them from the hare for four or five years. A row of alders may be planted in front of the laburnums, which no hare nor any other beast will touch. The wall he recommends to be built in the following manner, as being both cheaper and more durable than one construc-

ted entirely of stone. Raise it of stone to the height of two feet and a half from the ground, after which it is to be coped with sod as follows. First, lay on the wall, with the grassy side under, sod cut with the spade four or five inches deep, and of a length equal to the thickness of the wall. Next, cover this sod with loose earth rounded like a ridge. Third, prepare thin sod, cast with the paring spade, so long as to extend, beyond the thickness of the wall, two inches on each side. With these cover the loose earth, keeping the grassy side above; place them so much on the edge, that each sod shall cover part of another, leaving only about two inches without cover: when 20 or 30 yards are thus finished, let the sod be beat with mallets by two men, one on each side of the wall, striking both at the same time. By this operation the sod becomes a compact body that keeps in the moisture, and encourages the grass to grow. Lastly, cut off the ragged ends of the sod on each side of the wall, to make the covering neat and regular. The month of October is the proper season for this operation, because the sun and wind, during summer, dry the sod, and hinder the grass from vegetating. Moist soil affords the best sod. Wet soil is commonly too fat for binding; and, at any rate, the watery plants it produces will not thrive in a dry situation. Dry soil, on the other hand, being commonly ill bound with roots, shakes to pieces in handling. The ordinary way of coping with sod, which is to lay them flat and single, looks as if intended to dry the sod and kill the grass; not to mention that the sod is liable to be blown off the wall by every high wind.

Where the wall itself is to be used as a fence without any hedge, a ditch is to be made on each side, beginning a foot from the root of the wall, and sloping outward to the depth of three feet, or at least two and an half. The ditch should be equally sloped on the other side, so as to be four feet wide. A rood of this fence, including every article, may be done for three shillings or thereabouts; and a field of 10 acres thus inclosed, for about 30 l. which by a stone wall would cost upwards of 50 l. It will also stand many years without any need of reparation; while stone walls require no less than $2\frac{1}{2}$ per cent. of the original cost expended annually to keep them up.

The advantages of a thorn hedge, according to our author, are, that it is a very quick grower, when planted in a proper soil; shooting up six or seven feet in a season. Though tender, and apt to be hurt by weeds when young, it turns strong, and may be cut into any shape. Even when old, it is more disposed than other trees to lateral shoots; and lastly, its prickles make it the most proper of all for a fence. None of these thorns ought to be planted in a hedge till five years of age, and it is of the utmost importance that they be properly trained in the nursery. The best soil for a nursery, his Lordship observes, is between rich and poor. In the latter the plants are dwarfish: in the former, being luxuriant and tender, they are apt to be hurt during the severity of the weather; and these imperfections are incapable of any remedy. An essential requisite in a nursery is free ventilation. "How common (says his Lordship) is it to find nurseries in hollow sheltered places, surrounded with walls and high plantations, more fit for pine-apples than barren

the plants.

Hedges. barren trees! The plants thrust out long shoots, but feeble and tender: when exposed in a cold situation, they decay, and sometimes die. But there is a reason for every thing: the nurseryman's view is to make profit by saving ground, and by imposing on the purchaser tall plants, for which he pretends to demand double price. It is so difficult to purchase wholesome and well nursed plants, that every gentleman farmer ought to raise plants for himself.

25
Of raising
them from
the roots
of old
hedges.

"As thorns will grow pleasantly from roots, I have long practised a frugal and expeditious method of raising them from the wounded roots that must be cut off when thorns are to be set in a hedge. These roots, cut into small parts, and put in a bed of fresh earth, will produce plants the next spring no less vigorous than what are produced from seed; and thus a perpetual succession of plants may be obtained without any more seed. It ought to be a rule, never to admit into a hedge plants under five years old: they deserve all the additional sum that can be demanded for them. Young and feeble plants in a hedge are of slow growth; and, besides the loss of time, the paling necessary to secure them from cattle must be renewed more than once before they become a fence. A thorn hedge may be planted in every month of winter and spring unless it be frost. But I have always observed, that thorns planted in October are more healthy, push more vigorously, and fewer decay, than at any other time. In preparing the thorns for planting, the roots ought to be left as entire as possible, and nothing cut away but the ragged parts.

26
Proper method of
planting.

"As a thorn hedge suffers greatly by weeds, the ground where they are planted ought to be made perfectly clean. The common method of planting, is to leave eight or nine inches along a side of the intended ditch, termed a *scarfement*; and behind the scarfement to lay the surface soil of the intended ditch, cut into square sods two or three inches deep, its grassy surface under. Upon that sod, whether clean or dirty, the thorns are laid, and the earth of the ditch above them. The grass in the scarfement, with what weeds are in the moved earth, soon grow up, and require double diligence to prevent the young thorns from being choked. The following method deserves all the additional trouble it requires. Leaving a scarfement as above of 10 inches, and also a border for the thorns, broad or narrow according to their size; lay behind the border all the surface of the intended ditch, champed small with the spade, and upon it lay the mouldery earth that fell from the spade in cutting the said surface. Cover the scarfement and border with the under earth, three inches thick at least; laying a little more on the border to raise it higher than the scarfement, in order to give room for weeding. After the thorns are prepared by smoothing their ragged roots with a knife, and lopping off their heads to make them grow bushy, they are laid fronting the ditch, with their roots on the border, the head a little higher than the root. Care must be taken to spread the roots among the surface-earth taken out of the ditch, and to cover them with the mouldery earth that lay immediately below. This article is of importance, because the mouldery earth is the finest of all. Cover the stems of the thorns with the next stratum of the ditch, leaving always an inch at the top free. It is no matter how poor this

stratum be, as the plants draw no nourishment from it. Go on to finish the ditch, pressing down carefully every row of earth thrown up behind the hedge, which makes a good solid mound impervious to rain. It is a safeguard to the young hedge to raise this mound as perpendicular as possible; and for that reason, it may be proper, in loose soil, when the mound is raised a foot or so, to bind it with a row of the tough sod, which will support the earth above till it become solid by lying. In poor soil more care is necessary. Behind the line of the ditch the ground intended for the scarfement and border should be summer fallowed, manured, and cleared of all grass roots; and this culture will make up for the inferiority of the soil. In very poor soil, it is vain to think of planting a thorn hedge. In such ground there is a necessity for a stone fence.

"The only reason that can be given for laying thorns as above described, is to give the roots space to push in all directions; even upward into the mound of earth. There may be some advantages in this; but, in my apprehension, the disadvantage is much greater of heaping so much earth upon the roots as to exclude not only the sun, but the rain which runs down the sloping bank, and has no access to the roots. Instead of laying the thorns fronting the ditch, would it not do better to lay them parallel to it; covering the roots with three or four inches of the best earth, which would make a hollow between the plants and the sloping bank? This hollow would intercept every drop of rain that falls on the bank, to sink gradually among the roots. Why at any rate should a thorn be put into the ground sloping? This is not the practice with regard to any other tree; and I have heard of no experiment to persuade me that a thorn thrives better sloping than erect. There occurs, indeed, one objection against planting thorns erect, that the roots have no room to extend themselves on that side where the ditch is. But does it not hold, that when, in their progress, roots meet with a ditch, they do not push onward; but, changing their direction, push downward at the side of the ditch? If so, these downward roots will support the ditch, and prevent it from being mouldered down by frost. One thing is evident without experiment, that thorns planted erect may sooner be made a complete fence than when laid sloping as usual. In the latter case, the operator is confined to thorns that do not exceed a foot or 15 inches; but thorns five or six feet high may be planted erect; and a hedge of such thorns, well cultivated in the nursery, will in three years arrive to greater perfection than a hedge managed in the ordinary way will do in twice that time."

After the hedge is finished, it is absolutely necessary to secure it for some time from the depredations of cattle; and this is by no means an easy matter. "The ordinary method of a paling (says his lordship) is no sufficient defence against cattle: the most gentle make it a rubbing post, and the vicious wantonly break it down with their horns. The only effectual remedy is expensive; viz. two ditches and two hedges, with a mound of earth between them. If this remedy, however, be not palatable, the paling ought at least to be of the strongest kind. I recommend the following as the best I am acquainted with: Drive into the ground strong stakes three feet and an half long, with intervals from

Hedges

an hedge
after it is
planted.

Hedges.

from eight to twelve inches, according to the size of the cattle that are to be inclosed; and all precisely of the same height. Prepare plates of wood sawed out of logs, every plate three inches broad and half an inch thick. Fix them on the head of the stakes with a nail driven down into each. The stakes will be united so firmly, that one cannot be moved without the whole; and will be proof accordingly against the rubbing of cattle. But, after all, it is no fence against vicious cattle. The only proper place for it is the side of a high road, or to fence a plantation of trees. It will indeed be a sufficient fence against sheep, and endure till the hedge itself becomes a fence. A fence thus completed, including thorns, ditching, wood, nails, &c. will not much exceed two shillings every six yards."

28
Of training
up hedges.

His lordship discommends the ordinary method of training hedges by cutting off the top and shortening the lateral branches in order to make it thick and bushy. This, as well as the method of cutting off the stems two or three inches above the ground, indeed produces a great number of shoots, and makes a very thick fence, but which becomes so weak when bare of leaves, that cattle break through it in every part. To determine the best method of proceeding in this case, his lordship made an experiment on three hedges, which were twelve years old at the time he wrote. The first was annually pruned at the top and sides; the sides of the second were pruned, but not the top; and the third was allowed to grow without any pruning. The first, at the time of writing, was about four feet broad, and thick from top to bottom; but weak in the stems, and unable to resist any horned beast: the second was strong in its stems, and close from top to bottom: the third was also strong in its stems, but bare of branches for two feet from the ground; the lower ones having been deprived of air and rain by the thick shade of those above them. Hence he directs that hedges should be allowed to grow till the stems be five or six inches in circumference, which will be in ten or twelve years; at which time the hedge will be fifteen feet or more in height. The lateral branches next the ground must be pruned within two feet of the stem; those above must be made shorter and shorter in proportion to their distance from the ground; and at five feet high they must be cut close to the stem, leaving all above full freedom of growth. By this dressing the hedge takes on the appearance of a very steep roof; and it ought to be kept in that form by pruning. This form gives free access to rain, sun, and air: every twig has its share, and the whole is preserved in vigour. When the stems have arrived at their proper bulk, cut them over at five feet from the ground, where the lateral branches end. This answers two excellent purposes: the first is to strengthen the hedge, the sap that formerly ascended to the top being now distributed to the branches; the next is, that a tall hedge stagnates the air, and poisons both corn and grass near it. A hedge trained in this manner is impenetrable even by a bull.

29
Plashing of
hedges dis-
commended.

With regard to the practice of *plashing* an old hedge recommended by Dr Anderson, his lordship observes that "it makes a good interim fence, but at the long-run is destructive to the plants; and accordingly there is scarcely to be met with a complete good hedge

where plashing has been long practised. A thorn is a tree of long life. If, instead of being massacred by plashing, it were raised and dressed in the way here described, it would continue a firm hedge perhaps 500 years.

"A hedge ought never to be planted on the top of the mound of earth thrown up from the ditch. It has indeed the advantage of an awful situation; but being planted in bad soil, and destitute of moisture, it cannot thrive: it is at best dwarfish, and frequently decays and dies. To plant trees in the line of the hedge, or within a few feet of it, ought to be absolutely prohibited as a pernicious practice. It is amazing that people should fall into this error, when they ought to know that there never was a good thorn-hedge with trees in it. And how should it be otherwise? An oak, a beech, an elm, grows faster than a thorn. When suffered to grow in the midst of a thorn-hedge, it spreads its roots every where, and robs the thorns of their nourishment. Nor is this all: the tree, overshadowing the thorns, keeps the sun and air from them. At the same time, no tree takes worse with being overshadowed than a thorn.

"It is scarce necessary to mention gaps in a hedge, because they will seldom happen where a hedge is trained as above recommended. But in the ordinary method of training, gaps are frequent, partly by the failure of plants, and partly by the trespassing of cattle. The ordinary method of filling up gaps is to plant sweet briar where the gap is small, and a crab where it is large. This method I cannot approve for an obvious reason: a hedge ought never to be composed of plants which grow unequally. Those that grow fast, overtop and hurt the slow growers; and with respect, in particular, to a crab and sweet briar, neither of them thrive under the shade. It is a better method to remove all the withered earth in the gap, and to substitute fresh sappy mould mixed with some lime or dung. Plant upon it a vigorous thorn of equal height with the hedge, which in its growth will equal the thorns it is mixed with. In that view there should be a nursery of thorns of all sizes, even to five feet high, ready to fill up gaps. The best season for this operation is the month of October. A gap filled with sweet briar, or a crab lower than the hedge, invites the cattle to break through and trample the young plants under foot; to prevent which, a paling raised on both sides is not sufficient, unless it be raised as high as the hedge.

"Where a field is too poor to admit of a thorn-hedge, if there be no quantity of stones easily procurable, whins are the only resource. These are commonly placed on the top of a dry earth-dyke, in which situation they seldom thrive well. The following seems preferable. Two parallel ditches three feet wide and two deep, border a space of twelve feet. Within this space raise a bank at the side of each ditch with the earth that comes out of it, leaving an interval between the two banks. Sow the banks with whin seed, and plant a row of trees in the interval. When the whins are pretty well grown, the hedge on one of the banks may be cut down, then the other as soon as it becomes a fence, and so on alternately. While the whins are young, they will not be disturbed by cattle, if passages be left to go out and in. These passages may

Hedges. may be closed up when the hedge is sufficiently strong to be a fence. A whin-hedge, thus managed, will last many years, even in strong frost, unless very severe. There are many whin-hedges in the shire of Kincardine not so skilfully managed, and yet the possessors appear not to be afraid of frost. Such fences ought to be extremely welcome in the sandy grounds of the shire of Moray, where there is scarce a stone to be found. The few earth-fences that are there raised, composed mostly of sand, very soon crumble down."

Mr Bakewell's fences.*

In the fourth volume of Mr Young's Northern Tour, the author recommends the transplanting of old hedges, which his correspondent Mr Beverly says he has tried with prodigious success.

Mr Bakewell, we are told, is very curious in his fences, and plants his quicks in a different manner from what is common in various parts of the kingdom. He plants one row at a foot from set to set, and making his ditch, lays the earth which comes out of it to form a bank on the side opposite to the quick. In the common method the bank is made on the quick side above it. Reasons are not wanting to induce a preference of this method. The plants grow only in the surface the earth uncovered from the atmosphere, which must necessarily be a great advantage; whereas, in the usual way of planting, that earth, which is always the best, is loaded by a thick covering obliquely of the earth out of the ditch. If the roots shoot in the best soil, they will be out of the reach of the influences of the air; the consequence of which is, that they cannot have so large a space of that earth as if set on the flat. The way to have a tree or a quick thrive in the best manner possible, is to set it on the surface, without any ditch or trench, that cuts off half its pasture. But if a ditch is necessary, the next best way must of course be still to keep it on the flat surface; and the worst way to cover up that surface, by loading it with the dead earth out of a trench. To say that there are good hedges in the common method is not a conclusive argument, unless both were tried on the same soil and exposure.

*34
Of hedges
in stony
and gravelly
soils.*

In the 7th volume of the same work, a correspondent, who signs himself M. M. observes, that notwithstanding all the improvements that have been made in the construction of hedges and fences, there are many soils in England, which, from their sandy and gravelly natures, are little adapted to any of the plants in common use, and are therefore subject to all the inconveniences of dead hedges and gaps. Of this kind are all the sandy and gravelly inclosures, which constitute so large a part of many districts in the island. For these our author recommends a triple row of furze; though, notwithstanding its advantages, he says it is liable to be destroyed by severe winters, contrary to the assertion of Lord Kames above-related. "It is liable (says he) to be so completely cut off by a severe winter, that I have seen tracks of many hundred acres laid open in the space of a few weeks, and reduced to as defenceless a state as the surrounding wastes. On such soils therefore he recommends the holly; the only disadvantage of which, he says, is its slow growth. On most of these soils also the black thorn will rise spontaneously; and even the quick, though slowly, will advance to a sufficient degree of perfection. The

birch, however, he particularly recommends, as growing equally on the driest and on the wettest soils, propagating itself in such numbers, that were they not destroyed, all the sandy wastes of this kingdom would be quickly covered with them. He recommends particularly the keeping of a nursery for such plants as are commonly used for hedges. "I generally (says he) pick out a bit of barren land, and after ploughing it three or four times to bury and destroy the heath, I find it answer extremely well for a nursery. Into this spot I transplant quick, hollies, and every tree which I used for fences or plantations. By establishing such a nursery, a gentleman will always be able to command a sufficiency of strong and hardy plants which will not deceive his expectations. I look upon thorns of five or six years old, which have been twice transplanted from the seed-bed, to be the best of all; but as it may be necessary to fill up casual gaps in hedges that have been planted several years, a provision should be made of plants of every age, to 12 or 14 years old. All plants which are intended to be moved, should be transplanted every two or at most three years; without this attention, they attach themselves so firmly to the soil as renders a subsequent operation dangerous. All who transplant quicks or hollies ought to begin their labours as early as convenient in the autumn; for I have found by repeated experience that neither of these plants succeed so well in the spring."

*35
Of a proper
nursery.*

Where the fences of a track of ground are in a very ruinous condition, it is absolutely necessary to scower the ditches, throw up the banks, and secure the whole immediately by the firmest dead fences we can procure. If there is a total want of living plants, the cultivator can do nothing but plant new hedges; but if, as is generally the case, the banks are furnished with a multitude of old stems, though totally unconnected as a fence, the time and labour requisite for the intended improvement will be considerably abridged. All the straggling branches which add no solidity to the fence are to be cut off; after which the rest of the stems must be shortened to the height of three or four feet. The method of cutting down every thing to the ground, which is now so general, our author highly condemns. "Such a fence (says he) has within it no principle of strength and connection; it is equally exposed in every part to depredations of cattle and sportsmen; and even should it escape these, the first fall of snow will nearly demolish it. On the contrary, wherever these vegetable palisades can be left, they are impenetrable either for man or horse, and form so many points of union which support the rest."

Another method of strengthening defective fences, is to bend down some of the lateral shoots in a horizontal direction, and to spread them along the line of the farm like espalier trees in a garden. A single stem, when it rises perpendicularly, will not secure a space of more than two or three feet, but when bent longitudinally, they will form a barrier at least sufficient to repel all cattle but hogs for 12 or 14 feet on each side. By bending down, our author does not mean the common *plashing* method, which is very injurious to the plants; but the spreading two or three of the most convenient branches along the hedge, and fastening them down either by pegs or tying, without in-

*36

Plashing of
hedges dis-
commen-
ed.*

jury

Hedges.

jury to the stem, until they habitually take the proposed direction. Those who make the experiment for the first time will be astonished how small a number of plants may be made to fill a bank, with only trifling intervals. The birch is particularly useful for this purpose; being of so flexible a nature, that shoots of 10 or 12 feet in length may be easily forced into a horizontal direction; and if the other shoots are pruned away, all the juices of the plant will be applied to nourish the selected few: by which means they will in a few years acquire all the advantages of posts and rails, with this material difference, that instead of decaying, they become annually better. It is besides the property of all inclined branches to send up a multitude of perpendicular shoots; so that by this horizontal inclination, if judiciously made, you may acquire almost all the advantages of the thickest fence; but when the stems are too old and brittle to bear this operation, it will be advisable to cut off all the useless ones close to the ground, and next spring they will be succeeded by a number of young and vigorous ones. Select the best of these to be trained in the manner already directed, and extirpate all the rest, to increase their vigour. The shoots of such old stems as have been just now described will attain a greater size in three or four years than any young ones that can be planted will do in twelve.

38
Of thickening hedges by laying down the young shoots.

Another method which our author has practised with the greatest success is the following. The tender shoots of most trees, if bended downwards and covered with earth, will put forth roots, and being divided from the parent stem at a proper time become fresh plants; an operation well known to gardeners, under the name of *laying*. This may be as advantageous to the farmer, if he will take the very moderate trouble of laying down the young and flexible branches in his fences. Most species of trees, probably all, will be propagated by this method; but particularly the withy, the birch, the holly, the white thorn, and the crab, will also take root in this method, though more slowly; the latter being an excellent plant for fences, and not at all nice in the soil on which it grows. The advantage of laying down branches in this manner over the planting of young ones is, that when you endeavour to fill up a gap by the latter method, they advance very slowly, and are in danger of being stifled by the shade of the large trees; whereas, if you fortify a gap by spreading the branches along it in the manner just mentioned, and at the same time insert some of the most thriving shoots in the ground, they will advance with all the vigour of the parent plant, and you may allow them to grow until they are so fully rooted as to be free from danger of suffocation.

39
In what case the cutting down of hedges is proper.

It frequently happens, that the fences of an estate have been neglected for many years, and exhibit nothing but ragged and deformed stems at great intervals. In this case it will be proper to cut them all off level with the ground: the consequence of this is, that next year they will put forth a great number of shoots, which may be laid down in every direction, and trained for the improvement of the fence. When this operation is performed, however, it ought always to be done with an ax, and not with a saw; it being found that the latter instrument generally prevents the vege-

N^o 150.

tation of the plant. All the shoots laid down in this manner should be allowed to remain for several years, that they may be firmly rooted. Thus they will make prodigious advances; and it is to be observed, that the more the parent plant is divested of all superfluous branches, the greater will be the nourishment transmitted to the scions.

Our author, however, is inclined to suspect that the most perfect form of an hedge, at least in all but those composed of thorns and prickly plants, is to train up as many stems as will nearly touch each other. The force of every fence consists chiefly in the upright stems: where these are sufficiently near and strong, the hedge resists all opposition, and will equally repel the violence of the bull, and the insidious attacks of the hogs. It is absolutely proper that all hedges should be inspected once a-year; when not only the ditch ought to be thrown out, and the bank supported, but the straggling shoots of all the live plants ought to be pruned. By these are meant all such as project over the ditch beyond the line of the hedge, and which add nothing to its strength, though they deprive the useful stems of part of their nourishment. Where an hedge is composed of plants of inferior value, it will be proper to train those in the manner just now recommended, and to plant the bank with quick or holly. When these last have attained a sufficient size, the others may be extirpated; which is best done by cutting down all the shoots repeatedly in the summer, and leaving the roots to rot in the hedge.

In the 13th volume of the Annals, W. Erskine, Esq; gives an account of a method of fencing very much resembling that recommended by Lord Kames, and which has been already described. That gentleman is of opinion, that in some cases *dead stone-walls*, as they are called, are more advantageous than hedges. "That hedges (says he) are more ornamental, cannot be denied; and they are generally allowed to afford more shelter: but the length of time, the constant attention, and continual expence of defending them until they bear even the resemblance of a fence, induces many people in those places where the materials are easily procured, to prefer the dry stone walls; for though the first cost is considerable, yet as the farmer reaps the immediate benefit of the fence (which is undoubtedly the most secure one), they are thought on the whole to be the least expensive; besides, the cattle in exposed situations, and especially in these northern parts, are so impatient of confinement at the commencement of the long, cold, wet nights, that no hedges I have ever yet seen, in any part of this island, are sufficient to keep them in."

From considerations of this kind, the late Sir George Suttie of East Lothian was induced to think of a fence which might join the strength of the wall to the ornament of the hedge. His thorns were planted in the usual manner on the side of the ditch: but instead of putting behind them a post and rail or paling on the top of the bank, he erected a wall two feet and a half high; and being well situated for procuring lime, he used it in the construction of these walls which Mr Erskine greatly recommends; "as the satisfaction they afford, by requiring no repairs, and the duration of them, more than repay the expence: but where the

price

40

Hedges.

price of lime is high they may be built without any cement, and answer the purpose very well if the work is properly executed."

In making a new fence of this kind, the surface of the ground should be pared off the breadth of the ditch, and likewise for two feet more, in order to prevent as much as possible the thorns from being injured by the growth of grass and weeds. The ditch should be five feet broad, two and an half in depth, and one foot broad at the bottom. Leave one foot for an edging or scarcement, then dig the earth one spit of a spade for about one foot, and put about three inches of good earth below the thorn, which should be laid nearly horizontal, but the point rather inclining upwards, in order to let the rain drip to the roots; then add a foot of good earth above it: leave three or four inches of a scarcement before another thorn is planted; it must not be directly over the lower one, but about nine inches or a foot to one side of it: then throw a foot of good earth on the thorn, and trample it well down, and level the top of the bank for about three feet and an half for the base of the wall to rest on. This base should be about nine or ten inches, but must not exceed one foot from the thorn. The wall ought to be about two feet thick at the bottom and one foot at the top; the cope to be a single stone laid flat; then covered with two sods of turf, the grass of the undermost to be next the wall, and the other sod must have the grass side uppermost: the sods should be of some thickness, in order to retain moisture; so that they may adhere together, and not be easily displaced by the wind: the height of the wall to be two feet and an half, exclusive of the sods; which together should be from four to six inches, by which means the wall would be near to three feet altogether. The expence of the fences cannot so easily be counted, on account of the difference of the prices of labour in different parts. Mr Erskine had them done with lime, every thing included, from 10½d. to 13d. per ell (which is equal to 37 inches 2 parts), according to the ease or difficulty of working the quarry, and the distance of it from the place where the fence is erected. The lime costs about 6d. per boll of about 4.0872667 bushels; and from 15 to 16 bolls of lime are used to the rood of 36 square ells Scots measure; and there are upwards of 43 Scotch ells, or 44 English yards. When the common round or flint stones are made use of, as they require more lime, it is necessary to use 30 or 35 bolls of lime to the rood. The thorns are sold from five to ten shillings per thousand, according to their age, reckoning six score to the hundred. Making the ditch, laying the thorns, and preparing the top of the wall, generally cost from 7d. to 8d. every six ells. About 50 carts of stones, each cart carrying from 7 to 9 cwt. will build a rood; the carriage at 2d. per cart for half a mile's distance.

Warmth is undoubtedly as beneficial to hedges as trees; and the walls give an effectual shelter, which in exposed situations is absolutely necessary for rearing young hedges; and they likewise preserve a proper degree of moisture about the roots. If the hedges have been planted for six or seven years before the wall is built, cut them over to two or three inches above the ground with a sharp tool, either in October or November, or early in the spring; and erect the

VOL. VIII. Part I.

wall as quickly in that season as possible (the spring in this country can scarcely be said to begin till the end of March). It is almost impossible to imagine the rapidity with which hedges grow in favourable situations. Mr Erskine had one cut over in the spring, and by the end of the year it was almost as high as the wall. In three years he supposed, that not even the Highland sheep, who easily overleap a wall of four feet and an half in height, would have been able to break through it.

Notwithstanding the reasons that have been given already against the planting of timber trees in hedges, we find the practice recommended by some authors as one of the best situations for raising ship-timber. The reasons are, that the roots have free range in the adjoining inclosures, and the top is exposed to the exercise of the winds; by which means the trees are at once enabled to throw out strong arms, and have a large spreading head at the same time; so that we thus at once obtain quickness of growth, with strength and crookedness of timber. Well trained timber trees it is alleged are not prejudicial to hedges, though pollards and low spreading trees are destructive to the hedge-wood which grows under them; neither are high trees prejudicial to corn-fields like high hedges and pollards, which prevent a proper circulation of air; and in Norfolk, where the cultivation of grain is carried on in great perfection, such lands are said to be *wood-bound*. But when an hedge is trimmed down to four or five feet high, with oaks interspersed, a circulation of air is rather promoted than retarded by it; and a trimmed hedge will thrive quite well under tall stemmed trees, particularly oaks. For arable inclosures, therefore, hedges are recommended of four or five feet high, with oak-timbers from 15 to 25 feet stem. Higher hedges are more eligible for grass lands: the grasses affect warmth, by which their growth is promoted, and consequently their quantity is increased, though perhaps their quality may suffer some injury. A tall fence likewise affords shelter to cattle, provided it be thick and close at the bottom; but otherwise, by admitting the air in currents, it does rather harm than good. The shade of trees is equally friendly to cattle in summer; for which reason it is recommended in grass inclosures to allow the hedge to make its natural shoots, and at the same time to have oak-trees planted in it at proper intervals. Upon bleak hills, and in exposed situations, it will be proper to have two or even three rows of hedgewood, about four feet distant from each other; the middle row being permitted to reach, and always to remain at, its natural height: whilst the side rows are cut down alternately to give perpetual security to the bottom, and afford a constant supply of materials for dead hedges and other purposes of underwood.

Much has been said of the excellency of the holly as a material for hedges; and indeed the beauty of the plant, with its extreme closeness, and continuing green throughout the winter, evidently give it the preference to all others; and could it be raised with equal ease, there is no doubt that it would come into universal practice. Besides the above properties, the holly will thrive almost upon any soil; but thin-soiled stony heights seem to be its natural situation; and it may properly enough be said, that holly will grow

wherever corn will. Its longevity is likewise excessive; and being of slow growth, it does not *suck the land*, as the farmers express it, or deprive the crop of its nourishment, as other hedges do. The difficulty of raising holly may be obviated by planting it under crabs, which have a tendency to grow more upright than hawthorns, and consequently affording more air, will not impede its progress though they afford shelter. It may even be raised alone without any great difficulty; only in this case the dead fence, to secure it, must be kept up at least ten or twelve years, instead of six or seven, as in the other case; and indeed, considering the advantages to be derived from fences of this kind, they seem to merit all the additional trouble requisite.

The holly may be raised either under the crab or hawthorn in two ways, *viz.* by sowing the berries when the quick is planted, or by inserting the plants themselves the ensuing midsummer. The former is by much the more simple, and perhaps upon the whole the better method. The seeds may either be scattered among the roots of the deciduous plants, or be sown in a drill in front: and if plants of holly be put in, they may either be planted between those of the crab, or otherwise in front in the quincunx manner.

Where furze or whins are to be used either as a fence by themselves or an assistant to another, it is better to use the French seed than that produced in this country, as the former seldom ripens in this country, and consequently cannot like the latter over-run the adjacent inclosure. It may be had at the seed-shops in London for about 15d. per pound, and one pound will sow 40 statute rods. When used as an assistant to an hedge, it is more proper to sow it on the back of the bank than on the top of it; as in this case it is more apt to overhang the young plants in the face of the bank; whilst in the other it is better situated for guarding the bank, and preventing it from being torn down by cattle. The method of sowing is as follows: Chop a drill with a sharp spade about two-thirds of the way up the back of the bank, making the cleft gape as wide as may be without breaking off the lip; and having the seed in a quart bottle, stopp'd with a cork and goose quill, or with a perforated wooden stopper, trickle it along the drill, covering it by means of a broom drawn gently above and over the mouth of the drill. Closing the drill with the back of the spade, shuts up the seeds too much from the air, and thus keeps them too long from rising.

HEDGE-Hog. See ERINACEUS.

HEDGE-Sparrow. See MOTACILLA.

HEDYCARYA, in botany: A genus of the polyandria order, belonging to the diœcia class of plants. The calyx of the male is cleft in eight or ten parts; there is no corolla, nor are there any filaments; the antheræ are in the bottom of the calyx, four furrowed, and bearded at top. The calyx and corolla of the female are as in the male; the germs pedicellated; the nuts pedicellated and monospermous.

HEDYOTIS, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellate*. The corolla is monopetalous and fun-

nel-shaped; the capsule is bilocular, polyspermous, inferior. Hedysarum
||
Heem.

HEDYSARUM, in botany: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The carina of the corolla is transversely obtuse; the seed-vessel a legumen with monospermous joints. There are 59 species of this plant, of which the most remarkable are, 1. The gyrans, or sensitive hedsarum, a native of the East Indies, where it is called *burrum chundalli*. It arrives at the height of four feet, and in autumn produces bunches of yellow flowers. The root is annual or biennial. It is a trifolious plant, and the lateral leaves are smaller than those at the end, and all day long they are in constant motion without any external impulse. They move up and down and circularly. This last motion is performed by the twisting of the footstalks; and while the one leaf is rising, its associate is generally descending. The motion downwards is quicker and more irregular than the motion upwards, which is steady and uniform. These motions are observable for the space of 24 hours in the leaves of a branch which is lopped off from the shrub if it is kept in water. If from any obstacle the motion is retarded, upon the removal of that obstacle it is resumed with a greater degree of velocity. 2. The coronarium, or common biennial French honeysuckle, hath large deeply-striking biennial roots; upright, hollow, smooth, very branchy stalks, three or four feet high, garnished with pinnated leaves; and from between the leaves proceed long spikes of beautiful red flowers, succeeded by jointed seed-pods.

Culture. The first species being a native of hot climates, requires the common culture of tender exotics; the second is easily raised from seed in any of the common borders, and is very ornamental.

HEEL, in anatomy, the hind part of the foot. See ANATOMY, n° 66.

HEEL of a Horse, the lower hinder-part of the foot comprehended between the quarters and opposite to the toe. The heel of a horse should be high and large, and one side of it should not rise higher than the other upon the pastern. To recover the heels of a horse that is hoof-bound, you should take out his sole and keep his heels very wide, by which they will be restored in a month.

HEEL of a Horseman. This being the part that is armed with the spur, the word is used for the spur itself; "This horse understands the heel well." To ride a horse from one heel to another, is to make him go sideways, sometimes to one heel and sometimes to another.

HEEL, in the sea-language. If a ship leans on one side, whether she be aground or afloat, then it is said she heels a-starboard, or a-port; or that she heels off-wards, or to the shore; that is, inclines more to one side than to another.

HEELER, or *Bloody-HEEL Cock*, a fighting cock, that strikes or wounds much with his spurs.

The masters know such a cock, even while a chicken, by the striking of his two heels together in his going.

HEEM (John David), an able painter, born at Utrecht in 1604. He excelled in painting flowers, fruit,

Heemskirk fruit, vases, and instruments of music, which he performed in such a perfect manner, that a person was apt to attempt taking them in his hand. His colouring is agreeable, and the insects in his pictures appear alive. He died at Antwerp in 1674.

Cornelius de HEEM, his son, was also a good painter, though inferior to his father.

HEEMSKIRK. See **HEMSKIRK**.

HEGIRA, in chronology, a celebrated epoch among the Mahometans. The word Arabic, formed of *هجرة*, *hagirah*, flight; of *هجر*, to fly, quit one's country, family, friends, &c.

The event which gave occasion to this epocha, was Mahomet's flight from Mecca. The magistrates of that city, fearing his impostures might raise a sedition, resolved to expel him: this, accordingly, they effected in the year of our Lord 622, on the evening of the 15th or 16th of July. See **ARABIA**, n° 44.

To render this epocha more creditable, the Mahometans affect to use the word *begira* in a peculiar sense for an act of religion, whereby a man forsakes his country, and gives way to the violence of persecutors and enemies of the faith: they add, that the Corashites, being then the strongest party in the city, obliged their prophet to fly, as not being able to endure his abolishing of idolatry. This flight was not the first of Mahomet's, but it was the most famous. It happened in the 14th year from his assuming the character of prophet and apostle, and promulgating his new religion.

The orientals do not agree with us as to the time of the hegira. Among the Mahometans, Amasi fixes it to the year of Christ 630, and from the death of Moses 2347; and Ben Cassen to the year of the world 5800: according to the Greek computation, among the Christians, Said Ebn Batrik refers the hegira to the year of Christ 614, and of the creation 6114.

Khondemir relates, that it was Omar, the second caliph, that first established the hegira as an epocha, and appointed the years to be numbered from it: at the time he made this decree, there were already seven years elapsed. This establishment was made in imitation of the Christians, who, in those times, reckoned their years from the persecution of Dioclesian.

But there is another hegira, and that earlier too, though of less eminence. Mahomet, in the 14th year of his mission, was obliged to relinquish Medina: the Corashites had all along opposed him very vigorously, as an innovator and disturber of the public peace; and many of his disciples, not enduring to be reputed followers of an impostor, desired leave of him to abandon the city, for fear of being obliged to renounce their religion. This retreat makes the first hegira. These two hegiras the Mahometans, in their language, call *begiratan*.

The years of the hegira consist only of 354 days. To reduce these years to the Julian kalendar, i. e. to find what Julian year a given year of the hegira answers to, reduce the year of the hegira given into days, by multiplying by 354, divide the product by 365, and from the quotient subtract the intercalations, i. e. as many days as there are four years in the quotient; and lastly, to the remainder add 622. See **YEAR**.

HEIDEGGER (John James), was the son of a clergyman, and a native of Zurich in Switzerland, where he married, but left his country in consequence of an in-

trigue. Having had an opportunity of visiting the principal cities of Europe, he acquired a taste for elegant and refined pleasures, as they are called, which, united to a strong inclination for voluptuousness, by degrees qualified him for the management of public amusements. In 1708, when he was near 50 years old, he came to England on a negociation from the Swifs at Zurich; but, failing in his embassy, he entered as a private soldier in the guards for protection. By his sprightly engaging conversation and insinuating address, he soon worked himself into the good graces of our young people of fashion; from whom he obtained the appellation of "the Swifs Count." He had the address to procure a subscription, with which, in 1709, he was enabled to furnish out the opera of "Thomyris," which was written in English, and performed at the queen's theatre in the Haymarket. The music, however, was Italian; that is to say, airs selected from fundry of the foreign operas by Bunoncini, Scarlatti, Steffani, Gasparini, and Albinoni. Heidegger by this performance alone was a gainer of 500 guineas. The judicious remarks he made on several defects in the conduct of our operas in general, and the hints he threw out for improving the entertainments of the royal theatre, soon established his character as a good critic. Appeals were made to his judgment; and some very magnificent and elegant decorations introduced upon the stage in consequence of his advice, gave such satisfaction to George II. who was fond of operas, that, upon being informed to whose genius he was indebted for these improvements, his majesty was pleased from that time to countenance him, and he soon obtained the chief management of the opera-house in the Haymarket. He then set about improving another species of diversion, not less agreeable to the king, which was the masquerades, and over these he always presided at the king's theatre. He was likewise appointed master of the revels. The nobility now carested him so much, and had such an opinion of his taste, that all splendid and elegant entertainments given by them upon particular occasions, and all private assemblies by subscription, were submitted to his direction. From the emoluments of these several employments, he gained a regular considerable income, amounting, it is said, in some years, to 5000*l*. which he spent with much liberality; particularly in the maintenance of a somewhat too luxurious table; so that it may be said he raised an income, but never a fortune. At the same time his charities ought not to pass unnoticed, which were frequent and ample. After a successful masquerade, he has been known to give away several hundred pounds at a time. "You know poor objects of distress better than I do," he would frequently say to a particular acquaintance; "be so kind as to give away this money for me." This well-known liberality, perhaps, contributed much to his carrying on that diversion with so little opposition as he met with. He died in 1749, at the advanced age of 90 years.

As this person was long the *Arbiter Elegantiarum* of England, and is alluded to in many publications of his time, some account of him, it was thought, might be here expected: but to add all the anecdotes that have appeared concerning him, would enlarge this article beyond the limits to which it is intitled. One

Heiden-
heim,
Heidleberg.

or two of the most remarkable, however, are subjoined in a note (A), as they may afford entertainment to many of our readers.

HEIDENHEIM, a town of Germany, in Swabia, and in the territory of Brentzhall, with a handsome palace or castle, belonging to the house of Wirtemberg. E. Long. 10. 19. N. Lat. 48. 37.

HEIDLEBERG, a considerable and populous town of Germany, capital of the Lower Palatinate, with a celebrated university. It is noted for its great ton, which holds 800 hogheads, generally kept full of good Rhenish wine. It stands in a pleasant rich country, and was a famous seat of learning: but it has undergone so many calamities, that it is nothing now to what it was formerly. It was first reduced to a heap of ruins in 1622 by the Spaniards; and the rich library was transported partly to Vienna, and partly to the Vatican at Rome. After this it enjoyed the benefits of peace, till the Protestant electoral house became extinct, and a bloody war ensued, in which not only the castle was ruined, but the tombs and bodies of the electors were shamefully violated and pillaged. This happened in 1693; and the people of the Palatinate were obliged to leave their dwellings, and to go for refuge into foreign countries. To add to these

misfortunes, the elector resided at Mannheim, and carried most of the people of distinction along with him, so that it is uncertain whether Heidleberg will ever recover itself or not, though they have begun to rebuild some of the fortifications. The great ton was broke to pieces in 1693 by the French, and at great expence in 1729 was repaired. The town stands on the river Neckar, over which there is a handsome bridge. E. Long. 8. 48. N. Lat. 49. 25.

HEIGHT, in general, signifies the difference between the ground and the top of any object measured perpendicularly.

Methods of measuring HEIGHTS. See GEOMETRY, TRIGONOMETRY, BAROMETER, MOUNTAIN, &c.

HEILA, a town of royal Prussia, in Cassubia, seated at the mouth of the river Vistula, on the Baltic Sea, and subject to Poland, 12 miles north of Dantzic. E. Long. 19. 25. N. Lat. 54. 53.

HEILEGEN-HAVE, a sea-port town of Germany, in Lower-Saxony, and in Wageria, seated on the Baltic Sea, over against the island of Termeren. E. Long. 11. 15. N. Lat. 57. 30.

HEINECCIUS (John Gotlieb), one of the greatest civilians of the 18th century, was born at Eisenberg, in the principality of Altenburg, in 1681. After

Height-
Heineccius.

(A) Heidegger's countenance was peculiarly unpleasing, from an unusual harshness of features. There is a mezzotinto of him by J. Faber, 1742, from a painting by Vanloo, a striking likeness; and his face is introduced in more than one of Hogarth's prints.—Heidegger was, however, the first to joke upon his own ugliness; and he once laid a wager with the earl of Chesterfield, that within a certain given time his lordship would not be able to produce so hideous a face in all London. After strict search, a woman was found, whose features were at first sight thought stronger than Heidegger's; but upon clapping her head-dress upon himself, he was universally allowed to have won the wager. Jolly, a well-known taylor, carrying his bill to a noble duke; his grace, for evasion, said, "Damn your ugly face, I never will pay you till you bring me an uglier fellow than yourself!" Jolly bowed and retired, wrote a letter, and sent it by a servant to Heidegger; saying, "His grace wished to see him the next morning on particular business." Heidegger attended, and Jolly was there to meet him; and in consequence, as soon as Heidegger's visit was over, Jolly received the cash.

The late facetious duke of Montagu (the memorable author of the *Bottle-Confurer* at the theatre in the Haymarket) gave an entertainment at the Devil-tavern, Temple-bar, to several of the nobility and gentry, selecting the most convivial, and a few hard-drinkers, who were all in the plot. Heidegger was invited, and in a few hours after dinner was made so dead-drunk that he was carried out of the room, and laid insensible upon a bed. A profound sleep ensued; when the late Mrs Salmon's daughter was introduced, who took a mould from his face in plaster of Paris. From this a mask was made, and a few days before the next masquerade (at which the king promised to be present, with the countess of Yarmouth) the duke made application to Heidegger's valet-de-chambre, to know what suit of cloaths he was likely to wear; and then procuring a similar dress, and a person of the same stature, he gave him his instructions. On the evening of the masquerade, as soon as his majesty was seated (who was always known by the conductor of the entertainment and the officers of the court, though concealed by his dress from the company), Heidegger, as usual, ordered the music to play "God save the king;" but his back was no sooner turned, than the false Heidegger ordered them to strike up "Charly o'er the water." The whole company were instantly thunderstruck, and all the courtiers not in the plot were thrown into a stupid consternation. Heidegger flew to the music-gallery, swore, stamped, and raved, accusing the musicians of drunkenness, or of being set on by some secret enemy to ruin him. The king and the countess laughed so immoderately, that they

hazarded a discovery. While Heidegger staid in the gallery, "God save the King" was the tune; but when, after setting matters to rights, he retired to one of the dancing-rooms, to observe if decorum was kept by the company, the counterfeit stepping forward, and placing himself upon the floor of the theatre, just in front of the music-gallery, called out in a most audible voice, imitating Heidegger, damned them for block-heads, had he not just told them to play "Charly o'er the water?" A pause ensued; the musicians, who knew his character, in their turn thought him either drunk or mad; but as he continued his vociferation, "Charly" was played again. At this repetition of the supposed affront, some of the officers of the guards, who always attended upon these occasions, were for ascending the gallery and kicking the musicians out; but the late duke of Cumberland, who could hardly contain himself, interposed. The company were thrown into great confusion. "Shame! Shame!" resounded from all parts, and Heidegger once more flew in a violent rage to that part of the theatre facing the gallery. Here the duke of Montagu, artfully addressing himself to him, told him, "The king was in a violent passion; that his best way was to go instantly and make an apology, for certainly the musicians were mad, and afterwards to discharge them." Almost at the same instant, he ordered the false Heidegger to do the same. The scene now became truly comic in the circle before the king. Heidegger had no sooner made a genteel apology for the insolence of his musicians, but the false Heidegger advanced, and, in a plaintive tone, cried out, "Indeed, Sire, it was not my fault, but that devil's in my likeness." Poor Heidegger turned round, stared, staggered, grew pale, and could not utter a word. The duke then humanely whispered in his ear the sum of his plot, and the counterfeit was ordered to take off his mask. Here ended the frolic; but Heidegger swore he would never attend any public amusement, if that witch the wax-work woman did not break the mould, and melt down the mask before his face.

Being once at supper with a large company, when a question was debated, Which nationalist of Europe had the greatest ingenuity? to the surprise of all present, he claimed that character for the Swiss, and appealed to himself for the truth of it. "I was born a Swiss (said he), and came to England without a farthing, where I have found means to gain 5000 l. a-year, and to spend it. Now I defy the most able Englishman to go to Switzerland, and either to gain that income or to spend it there."—Heidegger is said to have had so remarkable a memory, that he once walked from Charing-cross to Temple-bar, and back again; and when he came home, wrote down every sign on each side of the street.

Heinetken,
Heinsius.

ter having studied at Gossar and Leipzick, he was designed for the ministry, and began to preach; but disliking that profession, he laid it aside, and applied himself entirely to the study of philosophy and the civil law. In 1710, he became professor of philosophy at Hall; and in 1721, he was made professor of civil law, with the title of *counsellor of the court*. His great reputation made the states of Friesland invite him to Franeker in 1724; but three years after, the king of Prussia prevailed on him to accept of a professorship of law at Francfort on the Oder, where he distinguished himself till the year 1733. Becoming again professor at Hall, he remained there till his death, which happened in 1741, notwithstanding his being invited to Marburg, Denmark, and three academies in Holland. He wrote many works, all of them much esteemed. The principal are, 1. *Antiquitatum Romanarum jurisprudentiam illustrantium syntagma*. It was this excellent abridgement that gave rise to his reputation in foreign countries. 2. *Elementa juris civilis secundum ordinem institutionum & pandectarum*. 3. *Fundamenta styli cultioris*. There are few works so useful as this for forming a Latin style. 4. *Elementa philosophiæ rationalis & moralis, quibus præmissa historia philosophica*. 5. *Historia juris civilis Romani ac Germanici*. 6. *Elementa juris naturæ & gentium*, &c.

HEINETKEN (Christian), an extraordinary child, the prodigy of the North, was born at Lubeck in 1721. He spoke his maternal tongue fluently at 10 months. At one year old, he knew the principal events of the pentateuch; in two months more, he was master of the entire history of the Old and New Testaments; at two years and an half, he answered the principal questions in geography and in ancient and modern history; and he spoke Latin and French with great facility before the commencement of his fourth year. His constitution was so delicate, that he was not weaned till a few months before his death. M. Martini of Lubec published a pamphlet in 1730, in which he endeavoured to give natural reasons for the extraordinary capacity of this infant, who died in his fifth year.

HEINSIUS (Daniel), professor of politics and history at Leyden, and librarian to the university there, was born at Gand in Flanders in 1580. He became a scholar to Joseph Scaliger at Leyden, and was indebted to the encouragement and care of that great man for the perfection to which he attained in literature, and which at the beginning of his life there was little reason to hope from him. He distinguished himself as a critic by his labours on many classical authors; and was highly honoured as well abroad as at home: Gustavus Adolphus king of Sweden gave him a place among his counsellors of state; the republic of Venice made him a knight of the order of St Mark; and pope Urban VIII. made him great offers, if he would come, as he expressed it, "to rescue Rome from barbarism." He died in 1666, leaving several works of his own, both in poetry and prose.

HEINSIUS (Nicholas), the son of Daniel Heinsius, was born at Leyden; and became as great a Latin poet, and a greater critic, than his father. His poems have been several times printed, but the best edition is that of Amsterdam in 1666. He gave editions of several of the classics, with notes; his Claudian is dedi-

cated in a Latin poem to queen Christina of Sweden, and his Ovid to Thuanus. At his death, which happened in 1681, he disclaimed all his works, and expressed the utmost regret at having left behind him so many "monuments of his vanity," as he called them. He was as much distinguished by his great employments in the state, as by his talents, learning, and good qualities.

HEIR, in law, signifies the person who succeeds another by descent to lands, tenements, and hereditaments, being an estate of inheritance, or an estate in fee; because nothing passes by right of inheritance but in fee. See the articles CONSANGUINITY, DESCENT, FEE, SUCCESSION; and LAW, N^o lxxvi. & clxxx. *et seq.*

HEIR-Apparent, is a person so called in the lifetime of his ancestor, at whose death he is heir at law.

HEIR-Presumptive, is one who, if the ancestor should die immediately, would, in the present circumstances of things, be his heir; but whose right of inheritance may be defeated by the contingency of some nearer heir being born.

HEIR-Loom, (formed of heir and the Saxon loom, denoting limb or members) in our law-books, signifies such goods and personal chattels as are not inventoried after the owner's decease, but necessarily come to the heir along with the house.

Heir-loom comprehends divers implements; as tables, presses, cupboards, bedsteads, furnaces, wainscot, and such like; which in some countries have belonged to a house for certain descents, and are never inventoried after the decease of the owner, as chattels are, but accrue by custom, not by common law, to the heir, with the house itself. The ancient jewels of the crown are held to be heir-looms, and are not devisable by will, but descend to the next successor.

HEIRESS, a female heir to one who has an estate in lands, &c. See HEIR.

Stealing an HEIRESS. See FORCIBLE Marriage.

HEIRSHIP MOVEABLES, in Scots law, the best of certain kinds of moveables, which the heir of line is intitled to take, besides the heritable estate. See LAW, N^o clxxx. 7.

HEISTERIA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. The calyx is quinquefid, the petals five; the fruit is a plum on a very large coloured calyx.

HELENA, or St HELENA, an island in the Atlantic Ocean, belonging to the English East India company, and situated in W. Long. 6. 30. S. Lat. 16°. The greatest length of the island is about eight miles, and its circumference about 20. It hath some high mountains, particularly one called *Diana's peak*, which is covered with woods to the very top. Other hills there are which bear evident marks of a volcanic origin; and some have huge rocks of lava, and a kind of half-vitrified flags. The country, according to Mr Forster, has a fine appearance; the soil is in many places a rich mould, from six to ten inches deep, and a variety of plants thrive in it luxuriantly. He found many plants here which he had not observed in other parts of the world. Among these were some called by the natives *cabbage-trees*, *gum-trees*, and *red wood*. The former thrive in moist places; but the latter are al-

Heir
Helena.

Helena.

ways found on the ridges of hills, where the soil is dry. The cabbage-tree has rather large leaves; but after many inquiries Mr Forster could not find that it was used for any other purpose than that of fuel, and no reason could be assigned why it had obtained that name. It must not be confounded with the cabbage-tree of America, India, and the South Seas, which is a species of palm.

The island is laid out entirely in gardens and pasturage. Peaches are the only European fruits that thrive here. Cabbages and other greens, which thrive extremely well, are devoured by caterpillars; and every species of corn is destroyed by rats. All the pastures were over-run with furze; which, though in our country a very useless and even pernicious plant, was of singular advantage to the inhabitants of St Helena. Before the introduction of that plant, the ground was parched by the intense heat, and all kinds of grass and herbage were shrivelled up. But the furze-bushes, which throve as it were in despite of the sun, preserved a degree of moisture in the ground; by which means the grass sprung up vigorously, and the country became covered with a rich and beautiful sod. The furze is now no longer wanted, and the people assiduously root it out for fuel. The number of people on St Helena does not exceed 2000 persons, including 500 soldiers and 600 slaves; and it is said that the number of females born on the island considerably exceeds that of the males. By the arrival of the India ships, which they supply with refreshments, they are in return provided with all sorts of manufactures and other necessaries; and the Company annually order one or two of their ships to touch there in their way to India, in order to send them a sufficient quantity of European goods and provisions. Many of their slaves are employed in catching fish, which are very plentiful; and, by the help of these, together with their poultry, cattle, roots, and salt provisions, they subsist through the year. Their life (says Mr Forster) seems to pass along very happily; free from the multitude of cares which distress their countrymen in England, and blessed with quiet and content.

St Helena was first discovered by the Portuguese in 1502, on St Helen's day; whence its name. They stocked it with different kinds of useful animals; but whether they ever settled a colony on it or not, is uncertain. The Portuguese having either abandoned or never taken possession of it, the Dutch became its masters; and kept possession of it till the year 1600, when they were driven out by the English. In 1673, the Dutch took it by surprise; but a short time after it was recovered by the brave captain Munden, who also took three Dutch East Indiamen then lying in the harbour. On this occasion the Hollanders had fortified the landing-place, of which there is only one on the island; and erected batteries of great guns to prevent a descent: but the English having knowledge of a small creek, where only two men abreast could creep up, climbed to the top of the rock in the night; and appearing the next morning behind the batteries, the Dutch were so terrified, that they threw down their arms, and surrendered at discretion. This creek has been since fortified, and a battery of large cannon placed at the entrance of it; so that now the island is

rendered perfectly secure against all regular approaches or sudden attacks.

HELEN, (in fab. hist.) the daughter of Tyndarus and Leda, was married to Menelaus king of Sparta, but was stolen from him by Theseus, 1235 B. C. She was restored soon after; but carried off again by Paris, the Trojan prince; which occasioned the famous Trojan war. See TROY.

St HELEN'S. See HELLENS.

HELENIUM, BASTARD SUN-FLOWER: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositae*. The receptacle is naked in the middle; under the radius paleaceous; the pappus consists of five short awns; the calyx is simple and multipartite; the florets of the radius semitrid.

Species. 1. The autumnale, with spear-shaped narrow leaves. 2. The latifolium, with pointed, spear-shaped, sawed leaves.—Both these are natives of North America, where they grow wild in great plenty. They rise to the height of seven or eight feet in good ground. The roots, when large, send up a great number of stalks, which branch toward the top; the upper part of the stalk sustains one yellow flower, shaped like the sun-flower, but much smaller, having long rays, which are jagged pretty deep into four or five segments.

Culture. These plants may be propagated by seeds, or by parting their roots; the latter is generally practised in this country. The best season to transplant and part the old roots is in October when their leaves are past, or in the beginning of March just before they begin to shoot. They delight in a soil rather moist than dry, provided it is not too strong, or does not hold the wet in winter.

HELENUS (fab. hist.), a celebrated soothsayer, son of Priam and Hecuba. He was greatly respected by all the Trojans. When Deiphobus was given in marriage to Helen in preference to himself, he resolved to leave his country, and retired to mount Ida, where Ulysses took him prisoner by the advice of Calchas. As he was well acquainted with futurity, the Greeks made use of prayers, threats, and promises, to induce him to reveal the secrets of the Trojans; and either the fear of death, or gratification of resentment, seduced him to disclose to the enemies of his country, that Troy could not be taken whilst it was in possession of the Palladium, nor before Polydectes came from his retreat at Lemnos and assisted to support the siege. After the ruin of his country, he fell to the share of Pyrrhus the son of Achilles, and saved his life by warning him to avoid a dangerous tempest, which in reality proved fatal to all those who set sail. This endeared him to Pyrrhus; and he received from his hand Andromache the widow of his brother Hector, by whom he had a son called *Cestrinus*. This marriage, according to some, was consummated after the death of Pyrrhus, who lived with Andromache as with a wife. Helenus was the only one of Priam's sons who survived the ruin of his country. After the death of Pyrrhus he reigned over part of Epirus, which he called *Chaonia* in memory of his brother Chaon, whom he had inadvertently killed. Helenus received Æneas as

Helen

Helenus.

hs

Helepolis
Heliastæ.

he voyaged towards Italy, and foretold him some of the calamities which attended his fleet. The manner in which he received the gift of prophecy is doubtful.

HELEPOLIS, in the ancient art of war, a machine for battering down the walls of a place besieged, the invention of which is ascribed to Demetrius Poliorcetes.—Diodorus Siculus says, that each side of the Helepolis was 405 cubits in breadth and 90 in height; that it had nine stages, and was carried on four strong solid wheels eight cubits in diameter; that it was armed with large battering rams, and had two roofs capable of supporting them; that in the lower stages there were different sorts of engines for casting stones; and in the middle they had large catapultas for discharging arrows, and smaller ones in those above, with a number of expert men for working all these machines.

HELIADES, in mythology, the daughters of the Sun and Clymenes, according to the poets. They were so afflicted, as they say, with the death of their brother Phaeton, that the gods, moved with compassion, transformed them into poplars on the banks of the river Eridanus.

HELIÆA, in Grecian antiquity, was the greatest and most frequented court in Athens for the trial of civil affairs. See HELIASTÆ.

HELIACAL, in astronomy, a term applied to the rising and setting of the stars; or, more strictly speaking, to their emersion out of and immersion into the rays and superior splendor of the sun.—A star is said to rise heliacally, when, after having been in conjunction with the sun, and on that account invisible, it comes to be at such a distance from him as to be seen in the morning before sun-rising; the sun, by his apparent motion, receding from the star towards the east. On the contrary, the heliacal setting is when the sun approaches so near a star as to hide it with his beams, which prevent the fainter light of the star from being perceived; so that the terms *apparition* and *occultation* would be more proper than *rising* and *setting*.

HELIANTHUS, the GREAT SUNFLOWER: A genus of the polygamia-frustanea order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is paleaceous and plane; the pappus diphylous; the calyx imbricated; the scales standing a little out at the tops. There are 12 species, most of which are now very common in our gardens, though all of them are natives of America. They are all very hardy, and will prosper in almost any soil or situation. They may be propagated either by seeds or by parting their roots.

HELIASTÆ, in antiquity, the judges of the court HELIÆA. They were so called, according to some authors, from a Greek word which signifies *to assemble in a great number*; and, according to others, from another word which signifies *the sun*, because they held their assemblies in an open place. They composed not only the most numerous, but likewise the most important of the Athenian tribunals; for their province was either to explain the obscure laws, or to give new vigour and authority to those which had been violated. The Thesmothetæ convoked the assembly of the Heliastæ, which sometimes amounted to 1000, sometimes to 1500, judges. Mr Blanchard is of opi-

nion, that, to make this number, the Thesmothetæ sometimes summoned those of each tribe who had last quitted the public offices which they had exercised in another court.

However that may be, it appears that the assemblies of the Heliastæ were not frequent, as they would have interrupted the jurisdiction of the stated tribunals and the common course of affairs.

The Thesmothetæ paid to each member of this assembly, for his attendance, three oboli: which are equal to two Roman sesterces, or to half a drachma. Hence Aristophanes terms them *the brothers of the tribulus*. They were likewise condemned to pay a fine if they came too late; and if they did not present themselves till after the orators had begun to speak, they were not admitted. Their attendance was requited out of the public treasury, and their pay was called *misthos heliasticus*.

The assembly met, at first, according to Aristophanes, at the rising of the sun. If the judges were obliged to meet under cover on account of frost and snow, they had a fire; but there is not a passage in any ancient author which informs us of the place where these assemblies were held either in the rigorous or in the mild seasons. We only learn, that there was a double enclosure around the assembly, that it might not be disturbed. The first was a kind of arbor-work, from space to space, separated by doors, over which were painted in red the ten or twelve first letters of the Greek alphabet, which directed the entrance of the officers who composed the tribunal, each of them entering under the letter which distinguished his tribe. The beadles of the court, to whom they showed the wands which had been sent them by the Thesmothetæ as a summons to meet, examined its mark, to see if it was authentic, and then introduced them. The second inclosure, which was at the distance of 20 feet from the former, was a rope or cord; that the people who stood round the first inclosure, and were desirous to see what passed within the second, might not be prevented from gratifying their curiosity at a proper distance. Thus the attention of the judges was not interrupted by the concourse of the multitude, many of whom were heated by views of interest or of party.

To each of the members of the assembly were distributed two pieces of copper; one of which was perforated, not certainly that it might be distinguished from the other by feeling, for these assemblies met at the rising and were dissolved at the setting of the sun. Those pieces of copper had been substituted for little sea-shells, which were at first in use. The king was present at the assembly, at whose command it had been summoned. The Thesmothetæ read the names of those who were to compose it, and each man took his place as he was called. The Thesmothetæ were then sent for, whose function it was to observe prodigies and to superintend the sacrifices; and if they gave their sanction, the deliberations were begun. It is well known, that the officers called *Exegetæ* were often corrupted by those who were interested in the debates of the assembly; and that they excited such tumults as were raised by the Roman tribunal in the popular assemblies convoked by the consuls.

Of all the monuments which remain relating to the Heliastæ, the most curious is the oath which those judges

Heliaſta.

judges took before the Theſmothetæ: Demosthenes hath preserved it in his oration against Timocrates, who having been bribed by those who had been intrusted with the effects taken on board a vessel of Naucratis, and refused to give an account of them, got a law passed, by which an enlargement was granted to prisoners for public debts on giving bail. Demosthenes, in making his oration against that law, ordered the oath of the Heliaſta to be read aloud, as a perpetual auxiliary to his arguments, and happily calculated to interest the multitude and inflame their passions. This oath we shall quote, that our readers may know how respectable a tribunal that of the Heliaſta was, and the importance of their decisions.

"I will judge according to the laws and decrees of the people of Athens, and of the senate of 500. I will never give my vote for the establishment of a tyrant, nor of an oligarchy. Nor will I ever give my approbation to an opinion prejudicial to the liberty or to the union of the people of Athens. I will not second those persons who may propose a reduction of private debts, or a distribution of the lands or houses of the Athenians. I will not recal exiles, nor endeavour to procure a pardon for those who shall be condemned to die. Nor will I force those to retire whom the laws and the suffrages of the people shall permit to remain in their country. I will not give my vote to any candidate for a public function who gives not an account of his conduct in the office which he has previously filled; nor will I presume to solicit any trust from the commonwealth without subjecting myself to this condition, which I mean as obligatory to the nine archons, to the chief of religious matters, to those who are balloted on the same day with the nine archons, to the herald, the ambassador, and the other officers of their court. I will not suffer the same man to hold the same office twice, or to hold two offices in the same year. I will not accept any present, either myself or by another, either directly or indirectly, as a member of the Heliaſtic assembly. I solemnly declare that I am 30 years old. I will be equally attentive and impartial to the accuser and the accused; I will give my sentence rigorously according to evidence. Thus I swear, by Jupiter, by Neptune, and by Ceres, to act. And if I violate any of my engagements, I imprecate from these deities ruin on myself and my family; and I request them to grant me every kind of prosperity, if I am faithful to my oath."

The reader should peruse what follows this oath to see with what eloquence Demosthenes avails himself of it, and how he applies its principles to the cause which he defends.

Here we have one of the motives of the meeting of this assembly. Aristotle informs us of another; which was by the public authority deputed to them, to elect a magistrate in the room of one dead. It is surprising, that Pausanias, who enters so often into details, gives us no particular account of this assembly. All that he says of it is, that the most numerous of the Athenian assemblies was called *Helicæ*.

We are told by Diogenes Laertius, in his life of Solon, that it was before one of these Heliaſtic assemblies that Pisistratus presented himself, covered with wounds and contusions (for thus he had treated himself and the mules which drew his car), to excite the

indignation of the people against his pretended enemies, who, jealous, as he alleged, of the popularity he had acquired by asserting the rights of his poorer fellow-citizens, in opposition to the men in power, had attacked him while he was hunting, and had wounded him in that barbarous manner. His design succeeded: a guard was appointed him; by the assistance of which he acquired the sovereignty or tyranny of Athens, and kept it 33 years. The power of the assembly appeared remarkably on that occasion; for Solon, who was present, opposed it with all his efforts, and did not succeed.

As to the manner in which the judges gave their suffrages, there was a sort of vessel covered with an osier mat, in which were placed two urns, the one of copper, the other of wood. In the lid of these urns there was an oblong hole, which was large at the top, and grew narrower downwards, as we see in some old boxes of our churches. The suffrages which condemned the accused person were thrown into the wooden urn, which was termed *kyrios*. That of copper, named *akyros*, received those which absolved him.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found an aristocracy established by the election of the nine archons (annual officers, whose power was almost absolute), tempered their sovereignty, by instituting the privilege of appealing from *them* to the people, who were to be assembled by lot to give their suffrage; after having taken the oath of the Heliaſta, in a place near the Panathenæum; where Hissus had, in former days, calmed a sedition of the people, and bound them to unanimity by an oath. It has likewise been remarked, that the god Apollo was not invoked in the oath of the Heliaſta, as in the oaths of the other judges. We have observed, that he who took the oath of the Heliaſta, engaged that he would not be corrupted by solicitation or money. Those who violated this part of their oath were condemned to pay a severe fine. The decemvirs at Rome made such corruption a capital crime. But Asconius remarks, that the punishment denounced against them was mitigated in later times; and that they were expelled the senate, or banished for a certain time, according to the degree of their guilt.

HELICON, in ancient geography, the name of a mountain in the neighbourhood of Parnassus and Cytheron, sacred to Apollo and the muses, who are thence called *Heliconides*. It is situated in Livadia, and now called *Zagura* or *Zaguya*.—Helicon was one of the most fertile and woody mountains in Greece. On it the fruit of the *adrachnus*, a species of the *arbutus* or of the strawberry-tree, was uncommonly sweet; and the inhabitants affirmed, that the plants and roots were all friendly to man, and that even the serpents had their poison weakened by the innoxious qualities of their food. It approached Parnassus on the north, where it touched on Phocis; and resembled that mountain in loftiness, extent, and magnitude.—Here was the shady grove of the muses and their images; with statues of Apollo and Bacchus, of Linus and Orpheus, and the illustrious poets who had recited their verses to the harp. Among the tripods, in the second century, was that consecrated by Hesiod. On the left-hand going to the grove was the fountain Aganippe; and about twenty stadia, or two miles and a half, higher up, the violet-

Heliaſta,
Helicon.

Heliconia
||
Helio-
meter.

violet-coloured Hippocrene. Round the grove were houses. A festival was celebrated there by the Thespiæans with games called *Musæa*. The vallies of Helicon are described by Wheler as green and flowery in the spring; and enlivened by pleasing cascades and streams, and by fountains and wells of clear water. The Bœotian cities in general, two or three excepted, were reduced to inconsiderable villages in the time of Strabo. The grove of the muses was plundered under the auspices of Constantine the Great. The Heliconian goddesses were afterwards consumed in a fire at Constantinople, to which city they had been removed. Their ancient seat on the mountain, Aganippe and Hippocrene, are unascertained.

HELICONIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The spathe is universal and partial; there is no calyx; the corolla has three petals, and the nectarium two leaves; the capsule is three-grained.

HELICTERES, the SCREW-TREE: A genus of the decandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 37th order, *Columniferae*. The calyx is monophyllous and oblique; there are five petals, and the nectarium consists of five petal-like leaflets; the capsules are intorted or twisted inwards.—There are four species, all natives of warm climates. They are shrubby plants, rising from five to fourteen feet in height, adorned with flowers of a yellow colour. They are propagated by seeds; but are tender, and in this country must be kept in a stove during the winter.

HELIOCARPUS, in botany: A genus of the digynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the 37th order, *Columniferae*. The calyx is tetraphyllous; the petals four; the styles simple; the capsule bilocular, compressed, and radiated lengthwise on each side.

HELIOCENTRIC LATITUDE of a Planet, the inclination of a line drawn between the centre of the sun and the centre of a planet to the plane of the ecliptic.

HELIOCENTRIC Place of a Planet, the place of the ecliptic wherein the planet would appear to a spectator placed at the centre of the sun.

HELIOCOMETES, a phenomenon sometimes observed about sun-setting; being a large luminous tail or column of light proceeding from the body of the sun, and dragging after it, not unlike the tail of a comet; whence the name.

HELIODORUS of PHOENICIA, bishop of Trica in Thessaly, better known by the romance he composed in his youth intitled *Æthiopics*, and relating the amours of Theagenes and Chariclea. Some say he was deposed by a synod because he would not consent to the suppressing that romance. The fable has a moral tendency, and particularly inculcates the virtue of chastity. As it was the first of this species of writing, he is styled the *Father of Romances*. He was also a good Latin poet. He lived in the 4th century.

HELIOMETER, formed of *ηλιος* sun, and *μετρον* I measure, the name of an instrument called also *astrometer*, invented by M. Bouguer in 1747, for measuring with particular exactness the diameters of the stars, and especially those of the sun and moon.

This instrument is a kind of telescope, consisting of two object-glasses of equal focal distance, placed one of them by the side of the other, so that the same eye-

glass serves for both. The tube of this instrument is of a conic form, larger at the upper end, which receives the two object-glasses, than at the lower, which is furnished with an eye-glass and micrometer. By the construction of this instrument two distinct images of an object are formed in the focus of the eye-glass, whose distance, depending on that of the two object-glasses from one another, may be measured with great accuracy: nor is it necessary that the whole disc of the sun or moon come within the field of view; since, if the images of only a small part of the disc be formed by each object-glass, the whole diameter may be easily computed by their position with respect to one another: for if the object be large, the images will approach, or perhaps lie even over one another; and the object-glasses being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known distance of the centres of the two glasses. Besides, as this instrument has a common micrometer in the focus of the eye-glass, when the two images of the sun or moon are made in part to cover one another, that part which is common to both the images may be measured with great exactness, as being viewed upon a ground that is only one half less luminous than itself; whereas, in general, the heavenly bodies are viewed upon a dark ground, and on that account are imagined to be larger than they really are. By a small addition to this instrument, provided it be of a moderate length, M. Bouguer thought it very possible to measure angles of three or four degrees, which is of particular consequence in taking the distance of stars from the moon. With this instrument M. Bouguer, by repeated observation, found, that the sun's vertical diameter, tho' somewhat diminished by the astronomical refraction, is longer than the horizontal diameter; and, in ascertaining this phenomenon, he also found, that the upper and lower edges of the sun's disc are not so equally defined as the other parts; on this account his image appears somewhat extended in the vertical direction. This is owing to the decomposition of light, which is known to consist of rays differently refrangible in its passage through our atmosphere. Thus the blue and violet rays, which proceed from the upper part of the disc at the same time with those of other colours, are somewhat more refracted than the others, and therefore seem to us to have proceeded from a higher point; whereas, on the contrary, the red rays proceeding from the lower edge of the disc, being less refracted than the others, seem to proceed from a lower point; so that the vertical diameter is extended, or appears longer, than the horizontal diameter.

Mr Servington Savery discovered a similar method of improving the micrometer, which was communicated to the Royal Society in 1743. See MICROMETER.

HELIOPHILA, in botany: A genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliquosæ*. There are two nectaria recurvated towards the vesicular base of the calyx.

HELIOPHOBIA, a name given to the white negroes or albinos, from their aversion to the light of the sun. See ALBINO.

HELIOPOLIS (anc. geog.), so called by Herodotus and Diodorus Siculus, by Moses On, and in Jeremiah *Bethsemes*; a city of Egypt, to the south-east of the Delta, and east of Memphis; of a very old standing,

Helio-
meter
||
Heliopolis.

Helioscoe

Helix.

standing, its origin terminating in fable. Here stood the temple of the sun, held in religious veneration. The city stood on an extraordinary mount, but in Strabo's time was desolate. It gave name to the *Nomos Heliopolites*.—There was another *Heliopolis* in Cœlo-syria, near the springs of the Orontes; so called from the worship of the sun, which was in great vogue over all Syria.

HELIOSCOPE, in optics, a sort of telescope, peculiarly fitted for viewing the sun without hurting the eyes. See TELESCOPE.

As the sun may be viewed through coloured glasses without hurt to the eyes, if the object and eye glasses of a telescope be made of coloured glass, as red or green, such a telescope will become an helioscope.

But Mr Huygens only used a plain glass, blacked at the flame of a candle on one side, and placed between the eye-glass and the eye; which answers the design of an helioscope very well.

HELIOSTATA, in optics, an instrument invented by the late learned Dr S. Gravesande; who gave it this name from its fixing, as it were, the rays of the sun in an horizontal direction across the dark chamber all the while it is in use. See OPTICS (Index.)

HELIOTROPE (*heliotropium*), among the ancients, an instrument or machine for showing when the sun arrived at the tropics and the equinoctial line. This name was also used for a sun-dial in general.

HELIOTROPE is also a precious stone, of a green colour, streaked with red veins. Pliny says it is thus called, because, when cast into a vessel of water, the sun's rays falling thereon seem to be of a blood colour; and that, when out of the water, it gives a faint reflection of the figure of the sun; and is proper to observe eclipses of the sun as a helioscope. The heliotrope is also called *oriental jasper*, on account of its ruddy spots. It is found in the East Indies, as also in Ethiopia, Germany, Bohemia, &c. Some have ascribed to it the faculty of rendering people invisible, like Gyges's ring.

HELIOTROPIUM, TURNSOLE: A genus of the polygynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 41st order, *Asperifolia*. The corolla is salver-shaped and quinquefid, with lesser dents interjected alternately; the throat closed up by small arches formed in the corolla itself. There are a number of species, all of them natives of warm countries. Only one, called the *triccoccum*, grows in Europe; and is a native of France, Spain, and Italy. It is only remarkable for the property of its berries, of which an account is given under *COLOUR-Making*, n° 36.

HELIX, in geometry, a spiral line. See SPIRAL.—The word is Greek, *ελίξ*, and literally signifies “a wreath or winding;” of *ελίσσω involvo*, “I environ.”

In architecture, some authors make a difference between the helix and the spiral. A stair-case, according to Daviler, is in a helix, or is helical, when the stairs or steps wind round a cylindrical newel; whereas the spiral winds round a cone, and is continually approaching nearer and nearer its axis.

HELIX is also applied, in architecture, to the cauliculi or little volutes under the flowers of the Corinthian capital; called also *urilla*.

HELIX, in anatomy, is the whole circuit or extent

of the auricle or border of the ear outwards. In opposition to which, the inner protuberance surrounded thereby, and answering thereto, is called *anthelix*. See ANATOMY, n° 141.

HELIX, the *Snail*, in zoology, a genus belonging to the order of vermes testacea. The shell consists of one spiral, brittle, and almost diaphanous valve; and the aperture is narrow. There are 60 species, principally distinguished by the figure of their shells. They are of various sizes, from that of a small apple to less than half a pea. Some of them live on land, frequenting woods and gardens, or inhabiting clefts of rocks and dry sand-banks. Others of them are aquatic, inhabiting ponds, deep rivers, and the ocean. The principal species are,

1. The *janthina*, with a violet-coloured shell, is remarkable for the extreme thinness of its texture, which breaks with the least pressure, and seems therefore entirely calculated to keep the open sea, or at least to shun rocky shores. It inhabits the seas of Europe, especially the Mediterranean; those of Asia and Africa; and also the ocean. The living animal, when touched, exudes a juice which stains the hands of a violet colour. Dr Hawkesworth, in his account of Cooke's voyage, mistakes this shell for that which yielded the *purpura* of the ancients. But whoever looks into Pliny, can never have the least idea that the thin shell aforementioned could be the same with it. They had several shells which yielded the purple dye: but these were all rock-shells*, and very different both in figure and hardness from the little helix *jacinta*; which is not calculated for the neighbourhood of rocks, as already mentioned. *Vid.* Plin. lib. v. cap. 1. and lib. ix. cap. 60, 61. See also Don Ant. Ulloa's Voyage to South America, book iv. ch. 8.

2. The *pomatia*, or exotic snail, with five spires, most remarkably ventricose, and fasciated with a lighter and a deeper brown, is a native of France, where it inhabits the woods; but has been naturalized in England, where it inhabits the woods of the southern counties. It was introduced, as it is said, by Sir Kenelm Digby; whether for medical purposes, or as food, is uncertain: tradition says, that to cure his beloved wife of a decay was the object. They are quite confined to our southern counties. An attempt was made to bring them into Northamptonshire, but they would not live there.—These are used as a food in several parts of Europe during Lent; and are preserved in an escargatoire, or a large plate boarded in, with a floor covered half a foot deep with herbs, in which the snails nestle and fatten†.—They were also a favourite dish with the Romans, who had their *coclearia*, a nursery similar to the above. Fulvius Hirpinus‡ was the first inventor of this luxury, a little before the civil wars between Cæsar and Pompey. The snails were fed with bran and soddened wine. If we could credit Varro||, they grew so large, that the shells of some would hold ten quarts! People need not admire the temperance of the supper of the younger Pliny§, which consisted of only a lettuce a-piece, three snails, two eggs, a barley-cake, sweet wine and snow,—in case his snails bore any proportion in size to those of Hirpinus.—Its name is derived not from any thing relating to an orchard, but from *πωμα*, an *operculum*, it having a very strong one. This seems to be the species described by Pliny,

Helix.

* See *Bucinum* and *Murex*.

|| L. iii.

c. 14.

§ Epist. xv.

Helix.

Pliny, lib. viii. c. 39. which he says was scarce; that it covered itself with the opercle, and lodged under ground; and that they were at first found only about the maritime Alps, and more lately near Velitræ. [See Plate CCXXXIV. the figure half the natural size.]

3. The hortensis, or garden-snail, is in form like the last, but less, and not umbilicated and clouded, or mottled with browns. It abounds with a viscid slimy juice, which it readily gives out by boiling in milk or water, so as to render them thick and glutinous. The decoctions in milk are apparently very nutritious and demulcent, and have been recommended in a thin acrimonious state of the humours, in consumptive cases and emaciations.

The eyes of snails are lodged in their horns, one at the end of each horn, which they can retract at pleasure. The manner of examining these eyes, which are four in number, is this: when the horns are out, cut off nimbly the extremity of one of them; and placing it before the microscope, you may discover the black spot at the end to be really a semiglobular eye.—The dissection of this animal is very curious; for by this means the microscope not only discovers the heart beating just against the round hole near the neck, which seems the place of respiration, but also the liver, spleen, stomach, and intestines, with the veins, arteries, mouth, and teeth, are plainly observable. The guts of this creature are green, from its eating of herbs, and are branched all over with fine capillary white veins: the mouth is like a hare's or rabbit's, with four or six needle-teeth, resembling those of leeches, and of a substance like horn.—Snails are all hermaphrodites, having both sexes united in each individual. They lay their eggs with great care in the earth, and the young ones are hatched with shells completely formed. Cutting off a snail's head, a little stone appears, which is supposed to be a great diuretic, and good in all nephritic disorders. Immediately under this stone the heart is seen beating; and the auricles are evidently distinguishable, and are membranous, and of a white colour; as are also the vessels which proceed from them.

Snails discharge their excrements at a hole in their neck; they also breathe by this hole, and their parts of generation are situated very near it. The penis is very long, and in shape resembles that of a whale. In the process of generation, it has been observed, that with the male and female part there issues, at the aperture of the neck, a kind of spear, shaped like the head of a lance, and terminating in a very acute point: and when the two snails turn the clefts in their necks towards each other, the spear issuing from one pricks the other, and then either drops to the ground or is carried off by the snail it has pricked. This snail instantly withdraws, but soon after rejoins the other, which it pricks in its turn; and after such mutual puncture, the copulation never fails of being consummated. Snails are said to couple three times at the distance of about fifteen days from each other, nature producing a new spear for each time of copulation, which lasts ten or twelve hours. At the end of about eighteen days they bring forth their eggs by the aperture of their neck.

So small an animal as the snail is not free from the plague of supporting other smaller animals on its body; and as in other animals we find these secondary ones either living only on their surface, as lice, &c. or only

in the intestines, as worms, it is very remarkable that this creature infests the snail in both these manners; being found sometimes on the surface of its body and sometimes within its intestines. There is a part of the common garden snail, and of other of the like kinds, commonly called the *collar*. This surrounds the neck of the snail, and is considerably thick, and is the only part that is visible when the animal is retired quietly into its shell. In this state of the animal these insects which infest it are usually seen in considerable numbers marching about very nimbly on this part: besides, the snail, every time it has occasion to open its anus, gives them a place by which to enter into its intestines, and they often seize the opportunity.

Snails are great destroyers of fruit in our gardens, especially the better sorts of wall-fruit. Lime and ashes sprinkled on the ground where they most resort will drive them away, and destroy the young brood of them: it is a common practice to pull off the fruit they have bitten; but this should never be done, for they will eat no other till they have wholly eat up this if it be left for them.

HELL, the place of divine punishment after death.

As all religions have supposed a future state of existence after this life, so all have their hell or place of torment in which the wicked are supposed to be punished. The hell of the ancient heathens was divided into two mansions; the one called *Elysium*, on the right hand, pleasant and delightful, appointed for the souls of good men; the other called *Tartara*, on the left, a region of misery and torment appointed for the wicked. The latter only was hell, in the present restrained sense of the word. See ELYSIUM.

The philosophers were of opinion, that the infernal regions were at an equal distance from all the parts of the earth; nevertheless it was the opinion of some, that there were certain passages which led thither, as the river Lethe near the Syrtes, and the Acherusian cave in Epirus. At Hermoine it was thought, that there was a very short way to hell; for which reason the people of that country never put the fare into the mouths of the dead to pay their passage.

The Jews placed hell in the centre of the earth, and believed it to be situated under waters and mountains. According to them, there are three passages leading to it: the first is in the wilderness, and by that Korah, Dathan, and Abiram, descended into hell; the second is in the sea, because Jonah, who was thrown into the sea, cried to God out of the belly of hell; the third is in Jerusalem, because it is said the fire of the Lord is in Zion, and his furnace is in Jerusalem. They likewise acknowledged seven degrees of pain in hell, because they find this place called by seven different names in scripture. Though they believed that infidels, and persons eminently wicked, will continue for ever in hell; yet they maintained, that every Jew who is not infected with some heresy, and has not acted contrary to the points mentioned by the rabbins, will not be punished therein for any other crimes above a year at most.

The Mahometans believe the eternity of rewards and punishments in another life. In the Koran it is said, that hell has seven gates, the first for the Mussulmans, the second for the Christians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians,

Hell.

Hell
Helle.

the sixth for the Pagans, and the seventh for the hypocrites of all religions.

Among Christians, there are two controverted questions in regard to hell; the one concerns locality, the other the duration of its torments. 1. The locality of hell, and the reality of its fire, began first to be controverted by Origen. That father, interpreting the scripture account metaphorically, makes hell to consist, not in external punishments, but in a consciousness or sense of guilt, and a remembrance of past pleasures. Among the moderns, Mr Whiston advanced a new hypothesis. According to him, the comets are so many hells appointed in their orbits alternately to carry the damned into the confines of the sun, there to be scorched by its violent heat, and then to return with them beyond the orb of Saturn, there to starve them in these cold and dismal regions. Another modern author, not satisfied with any hypothesis hitherto advanced, assigns the sun to be the local hell. 2. As to the second question, viz. the duration of hell-torments, we have Origen again at the head of those who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due course of punishment suitable to their respective crimes, shall be pardoned and restored to heaven. The chief principle upon which Origen built his opinion, was the nature of punishment, which he took to be emendatory, applied only as physic for the recovery of the patient's health. The chief objection to the eternity of hell torments among modern writers, is the disproportion between temporary crimes and eternal punishments. Those who maintain the affirmative, ground their opinions on scripture accounts, which represent the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as also upon the words, "These shall go away into everlasting punishment, but the righteous into life eternal."

HELLANICUS of Mitylene, a celebrated Greek historian, born before Herodotus, flourished about 480 B. C. He wrote a history of the ancient kings and founders of cities, but which hath not come down to us.

HELLAS, (anc. geog.), an appellation comprising, according to the more ancient Greeks and Romans, Achaia and Peloponnesus, but afterwards restrained to Achaia. It was bounded on the west by the river Achelous, on the north by mounts Othrys and Oeta, on the east by the Egean sea, and on the south by the Saronic and Corinthian bays, and by the isthmus which joins it to Peloponnesus. It was called *Hellas*, from Hellen the son of Deucalion; or from *Hellas*, a district of Thessaly; whence *Hellenes*, the gentilitious name, denoting Greeks. Now called *Livadia*.

HELLE, (fab. hist.) a daughter of Athamas king of Thebes by Nephele. She fled from her father's house with her brother Phryxus, to avoid the cruel oppression of her mother-in-law Ino. According to some accounts she was carried through the air on a golden ram which her mother had received from Neptune, and in her passage she became giddy and fell from her seat into that part of the sea which from her received the name of *Hellspont*. Others say that she was carried on a cloud, or rather upon a ship, from which she fell into the sea and was drowned. Phryxus, after he had

given his sister a burial on the neighbouring coasts, pursued his journey and arrived in Colchis.

HELLEBORE. See HELLEBORUS.

White-HELLEBORE. See VERATRUM.

HELLEBORUS, HELLEBORE: A genus of the polygynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 26th order, *Multiflorae*. There is no calyx; but five or more petals; the nectaria are bilabiated and tubular; the capsules polyspermous, and a little erect.

Species. The most remarkable species of this plant is the niger, commonly called *Christmas rose*. It hath roots composed of many thick fleshy spreading fibres, crowned by a large cluster of lobed leaves, consisting each of seven or eight obtuse fleshy lobes, united to one foot-stalk; and between the leaves several thick fleshy flower-stalks three or four inches high, surmounted by large beautiful white flowers of five roundish petals, and numerous filaments, appearing in winter, about or soon after Christmas.

Culture. This plant may be propagated either by seeds or parting the roots. It prospers in the open borders, or may be planted in pots to move when in bloom in order to adorn any particular place; but it always flowers fairest and most abundantly in the front of a warm sunny border. The plants may be removed, and the roots divided for propagation, in September, October, or November; but the sooner in autumn it is done, the stronger will the plants flower at their proper season.

Uses. The root of this plant was anciently used as a cathartic. The taste of it is acrid and bitter. Its acrimony, as Dr Grew observes, is first felt on the tip of the tongue, and then spreads itself immediately to the middle, without being much perceived in the intermediate part. On chewing the root for a few minutes, the tongue seems benumbed, and affected with a kind of paralytic stupor, as when burnt by eating any thing too hot. The fibres are more acrimonious than the head of the root from whence they issue. Black hellebore root, taken from 15 to 30 grains, proves a strong cathartic; and, as such, has been celebrated for the cure of maniacal and other disorders proceeding from what the ancients called the *atrabilis*; in which cases, medicines of this kind are doubtless occasionally of use, though they are by no means possessed of any specific power. It does not however appear, that our black hellebore acts with so much violence as that of the ancients; whence many have supposed it to be a different species of plant: and indeed the descriptions which the ancients have left us of their hellebore, do not agree with those of any of the sorts usually taken notice of by modern botanists. Another species has been discovered in the eastern countries, which Tournefort distinguishes by the name of *helleborus niger orientalis, amplissimo folio, caule præalto, flore purpurascens*, and supposes to be the true ancient hellebore, from its growing in plenty about mount Olympus, and in the island of Anticyra, celebrated of old for the production of this antimanicacal drug: he relates, that a scruple of this sort, given for a dose, occasioned convulsions.—Our hellebore is at present looked upon principally as an alterative; and in this light is frequently employed, in small doses, for attenuating viscid humours, promoting the uterine and urinary discharges, and opening

dicæ.

inveterate obstructions of the remoter glands. It often proves a powerful emmenagogue in plethoric habits, where steel is ineffectual or improper. In some parts of Germany, a species of black hellebore has been made use of, which frequently produced violent, and sometimes deleterious, effects. It appears to be the fetid kind of Linnæus, called in English *settlewort*, *setterwort*, or *bastard hellebore*. The roots of this may be distinguished from those of the true kind, by their being less black.

HELLEN, the son of Deucalion, is said to have given the name of Hellenists to the people before called *Greeks*, 1521 B. C. See GREECE.

HELLENISM, in matters of language, a phrase in the idiom, genius, or construction of the Greek tongue.

This word is only used when speaking of the authors who, writing in a different language, express themselves in a phraseology peculiar to the Greek.

HELLENISTIC LANGUAGE, that used by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this language it is said the Septuagint was written, and also the books of the New Testament; and that it was thus denominated to show that it was Greek filled with Hebraisms and Syriacisms.

HELLENISTS (*Hellenistæ*), a term occurring in the Greek text of the New Testament, and which in the English version is rendered *Grecians*.

The critics are divided as to the signification of the word. Cæcumenius, in his Scholia on Acts vi. 1. observes, that it is not to be understood as signifying those of the religion of the Greeks, but those who spoke Greek, τῆς ἑλληνικῆς φωνῆς ἡμενῶν. The authors of the Vulgate version, indeed, render it like ours, *Græci*; but Messieurs Du Port Royal more accurately, *Juifs Grecs*, Greek or Grecian Jews; it being the Jews who spoke Greek that are here treated of, and who are hereby distinguished from the Jews called *Hebrews*, that is, who spoke the Hebrew tongue of that time.

The Hellenists, or Grecian Jews, were those who lived in Egypt and other parts where the Greek tongue prevailed. It is to them we owe the Greek version of the Old Testament, commonly called the *Septuagint*, or that of the seventy.

Salmasius and Vossius are of a different sentiment with regard to the Hellenists. The latter will only have them to be those who adhered to the Grecian interests.

Scaliger is represented, in the Scaligerana, as asserting the Hellenists to be the Jews who lived in Greece and other places, and who read the Greek Bible in their synagogue, and used the Greek language in *sacris*; and thus they were opposed to the Hebrew Jews, who performed their public worship in the Hebrew tongue; and in this sense St Paul speaks of himself as a Hebrew of the Hebrews, Phil. iii. 5. i. e. a Hebrew both by nation and language. The Hellenists are thus properly distinguished from the *Hellenes* or *Greeks*, mentioned John xii. 20. who were Greeks by birth and nation, and yet proselytes to the Jewish religion.

HELLENODICÆ, ἑλληνοδικαί, in antiquity, the directors of the Olympian games. At first there was only one, afterwards the number increased to two and to three, and at length to nine. They assembled in a place called ἑλληνοδικαίον, in the Elean forum, where

they were obliged to reside ten months before the celebration of the games, to take care that such as offered themselves to contend, performed their προγυμνασμοῦ, or preparatory exercises, and to be instructed in all the laws of games by certain men called νομοφύλακες, i. e. "keepers of the laws." And the better to prevent all unjust practices, they were farther obliged to take an oath, that they would act impartially, would take no bribes, nor discover the reason for which they disliked or approved of any of the contenders. At the solemnity they sat naked, having before them the victorial crown till the exercises were finished, and then it was presented to whomsoever they adjudged it. Nevertheless, there lay an appeal from the hellenodicæ to the Olympian senate.

HELLESPONT, a narrow strait between Asia and Europe, near the Propontis, which received its name from HELLE who was drowned there in her voyage to Colchis. It is celebrated for the love and death of Leander, and for the bridge of boats which Xerxes built over it when he invaded Greece. The folly of this great prince is well known in beating and fettering the waves of the sea, whose impetuosity fettered his ships, and rendered all his labours ineffectual. It is now called the *Dardanelles*. It is about 33 miles long, and in the broadest parts the Asiatic coast is about one mile and a half distant from the European, and only half a mile in the narrowest, according to modern investigation, and the cocks are heard crowing from the opposite shores.

HELLEN'S (St) a town of the Isle of Wight, in East-Medina, has a bay which runs a considerable way within land, and in a war with France is often the station and place of rendezvous for the royal navy. At the mouth of the bay is that cluster of rocks called the *Mixen*. It had an old church situated at the extremity of the coast, which was endangered to be washed away, as was a great part of the church-yard, which occasioned a new church to be built in 1719. The priory to which the old church belonged is now converted into a gentleman's seat; is in a remarkably pleasant situation, and commands a fine prospect of Portsmouth and the Road at Spithead. St Helen's appears to have been of more consideration in former times than at present.

HELM, a long and flat piece of timber, or an assemblage of several pieces, suspended along the hind-part of a ship's stern-post, where it turns upon hinges to the right or left, serving to direct the course of the vessel, as the tail of a fish guides the body.

The helm is usually composed of three parts, viz. the rudder, the tiller, and the wheel, except in small vessels, where the wheel is unnecessary.

As to the form of the rudder, it becomes gradually broader in proportion to its distance from the top, or to its depth under the water. The back, or inner part of it, which joins to the stern-post, is diminished into the form of a wedge throughout its whole length, so as that the rudder may be more easily turned from one side to the other, where it makes an obtuse angle with the keel. It is supported upon hinges; of which those that are bolted round the stern-post to the after-extremity of the ship, are called *googings*, and are furnished with a large hole on the after-part of the stern-post. The other parts of the hinges, which are bolted to

Hellepont
Helm.

Helm.

to the back of the rudder, are called *pintles*, being strong cylindrical pins, which enter into the goosings, and rest upon them. The length and thickness of the rudder is nearly equal to that of the stern-post.

The rudder is turned upon its hinges by means of a long bar of timber, called the *tiller*, which is fixed horizontally in its upper end within the vessel. The movements of the tiller to the right and left, accordingly, direct the efforts of the ruder to the government of the ship's course as she advances; which, in the sea-language, is called *steering*. The operations of the tiller are guided and assisted by a sort of tackle, communicating with the ship's side, called the *tiller-rope*, which is usually composed of untarred rope-yarns for the purpose of traversing more readily through the blocks or pulleys.

In order to facilitate the management of the helm, the tiller-rope, in all large vessels, is wound about a wheel, which acts upon it with the powers of a crane or windlass. The rope employed in this service being conveyed from the fore-end of the tiller *k*, to a single block *i*, on each side of the ship†, is farther communicated to the wheel, by means of two blocks suspended near the mizen-mast, and two holes immediately above, leading up to the wheel, which is fixed upon an axis on the quarter-deck, almost perpendicularly over the fore-end of the tiller. Five turns of the tiller-rope are usually wound about the barrel of the wheel; and, when the helm is amidship, the middle turn is nailed to the top of the barrel, with a mark by which the helmsman readily discovers the situation of the helm, as the wheel turns it from the starboard to the larboard side. The spokes of the wheel generally reach about eight inches beyond the rim or circumference, serving as handles to the person who steers the vessel. As the effect of a lever increases in proportion to the length of its arm, it is evident that the power of the helmsman to turn the wheel will be increased according to the length of the spokes beyond the circumference of the barrel.

† See Deck,
Pl. CLVI.

Plate
CCXXVI.

When the helm, instead of lying in a right line with the keel, is turned to one side or the other, as in BD, fig. 1. it receives an immediate shock from the water, which glides along the ship's bottom in running *ast* from A to B; and this fluid pushes it towards the opposite side, whilst it is retained in this position: so that the stern, to which the rudder is confined, receives the same impression, and accordingly turns from B to *b* about some point *c*, whilst the head of the ship passes from A to *a*. It must be observed, that the current of water falls upon the rudder obliquely, and only strikes it with that part of its motion which acts according to the sine of incidence, pushing it in the direction NP, with a force which not only depends on the velocity of the ship's course, by which this current of water is produced, but also upon the extent of the sine of incidence. This force is by consequence composed of the square of the velocity with which the ship advances, and the square of the sine of incidence, which will necessarily be greater or smaller according to circumstances; so that if the vessel runs three or four times more swiftly, the absolute shock of the water upon the rudder will be nine or 16 times stronger under the same incidence: and, if the inci-

dence is increased, it will yet be augmented in a greater proportion, because the square of the sine of incidence is more enlarged. This impression, or, what is the same thing, the power of the helm, is always very feeble, when compared with the weight of the vessel; but as it operates with the force of a long lever, its efforts to turn the ship are extremely advantageous. For the helm being applied to a great distance from the centre of gravity G, or from the point about which the vessel turns horizontally, if the direction PN of the impression of the water upon the rudder be prolonged, it is evident that it will pass perpendicularly to R, widely distant from the centre of gravity G: thus the absolute effort of the water is very powerful. It is not therefore surprising, that this machine impresses the ship with a considerable circular movement, by pushing the stern from B to *b*, and the head from A to *a*; and even much farther whilst she sails with rapidity, because the effect of the helm always keeps pace with the velocity with which the vessel advances.

Amongst the several angles that the rudder makes with the keel, there is always one position more favourable than any of the others, as it more readily produces the desired effect of turning the ship, in order to change her course. To ascertain this, it must be considered, that if the obliquity of the rudder with the keel is greater than the obtuse angle ABD, so as to diminish that angle, the action of the water upon the rudder will increase, and at the same time oppose the course of the ship in a greater degree; because the angle of incidence will be more open, so as to present a greater surface to the shock of the water, by opposing its passage more perpendicularly. But at that time the direction NP of the effort of the helm upon the ship will pass with a smaller distance from the centre of gravity G towards R, and less approach the perpendicular NL, according to which it is absolutely necessary that the power applied should act with a greater effect to turn the vessel. Thus it is evident, that if the obtuse angle ABD is too much inclosed, the greatest impulse of the water will not counterbalance the loss sustained by the distance of the direction NP from NL, or by the great obliquity which is given to the same direction NP of the absolute effort of the helm with the keel AB. If, on the contrary, the angle ABD is too much opened, the direction NP of the force of the action of the helm will become more advantageous to turn the vessel, because it will approach nearer the perpendicular NL; so that the line prolonged from NP will increase the line GR, by removing R to a greater distance from the centre of gravity G: but then the helm will receive the impression of the water too obliquely, for the angle of incidence will be more acute; so that it will only present a small portion of its breadth to the shock of the water, and by consequence will only receive a feeble effort. By this principle it is easy to conceive, that the greatest distance GR from the centre of gravity G, is not sufficient to repair the diminution of force occasioned by the too great obliquity of the shock of the water. Hence we may conclude, that when the water either strikes the helm too directly, or too obliquely, it loses a great deal of the effect it ought to produce. Between the two extremes there is therefore

Helm.

Helm. fore a mean position, which is the most favourable to its operations.

The diagonal NP of the rectangle IL represents the absolute direction of the effort of the water upon the helm. NI expresses the portion of this effort which is opposed to the ship's head-way, or which pushes her altern, in a direction parallel to the keel. It is easily perceived, that this part NI of the whole power of the helm contributes but little to turn the vessel; for, if IN is prolonged, it appears that its direction approaches to a very small distance GV from the centre of gravity G; and that the arm of the lever $BN = GV$, to which the force is applied, is not in the whole more than equal to half the breadth of the rudder: but the relative force NL, which acts perpendicular to the keel, is extremely different. If the first NI is almost useless, and even pernicious, by retarding the velocity; the second NL is capable of a very great effect, because it operates at a considerable distance from the centre of gravity G of the ship, and acts upon the arm of a lever GE, which is very long. Thus it appears, that between the effects NL and NI, which result from the absolute effort NP, there is one which always opposes the ship's course, and contributes little to her motion of turning; whilst the other produces only this movement of rotation, without operating to retard her velocity.

Geometricians have determined the most advantageous angle made by the helm with the line prolonged from the keel, and fixed it at $54^{\circ} 44'$, presuming that the ship is as narrow at her floating-line, or at the line described by the surface of the water round her bottom, as at the keel. But as this supposition is absolutely false, inasmuch as all vessels augment their breadth from the keel upward to the extreme breadth, where the floating-line or the highest water-line is terminated; it follows, that this angle is too large by a certain number of degrees. For the rudder is impressed by the water, at the height of the floating-line, more directly than at the keel, because the fluid exactly follows the horizontal outlines of the bottom; so that a particular position of the helm might be supposed necessary for each different incidence which it encounters from the keel upwards. But as a middle position may be taken between all these points, it will be sufficient to consider the angle formed by the sides of the ship, and her axis, or the middle-line of her length, at the surface of the water, in order to determine afterwards the mean point, and the mean angle of incidence.

It is evident that the angle $54^{\circ} 44'$ is too open, and very unfavourable to the ship's head-way, because the water acts upon the rudder there with too great a sine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below: but above, the shock of the water is almost perpendicular to the rudder, because of the breadth of the bottom, as we have already remarked. If then the rudder is only opposed to the fluid, by making an angle of 45° with the line prolonged from the keel, the impression, by becoming weaker, will be less opposed to the ship's head-way, and the direction NP of the absolute effort of the water upon the helm drawing nearer to the lateral perpendicular, will be placed more advantageously, for the reasons above mentioned. On

Helm. the other hand, experience daily testifies, that a ship steers well when the rudder makes the angle DBE equal to 35° only.

It has been already remarked, that the effect of moving the wheel to govern the helm increases in proportion to the length of the spokes; and so great is the power of the wheel, that if the helmsman employs a force upon its spokes equivalent to 30 pounds, it will produce an effect of 90 or 120 pounds upon the tiller. On the contrary, the action of the water is collected into the middle of the breadth of the rudder, which is very narrow in comparison with the length of the tiller; so the effort of the water is very little removed from the fulcrum B upon which it turns; whereas the tiller forms the arm of a lever 10 or 15 times longer, which also increases the power of the helmsman in the same proportion that the tiller bears to the lever upon which the impulse of the water is directed. This force then is by consequence 10 or 15 times stronger; and the effort of 30 pounds, which at first gave the helmsman a power equal to 90 or 120 pounds, becomes accumulated to one of 900 or 1800 pounds upon the rudder. This advantage then arises from the shortness of the lever upon which the action of the water is impressed, and the great comparative length of the tiller, or lever, by which the rudder is governed; together with the additional power of the wheel that directs the movements of the tiller, and still farther accumulates the power of the helmsman over it. Such a demonstration ought to remove the surprise with which the prodigious effect of the helm is sometimes considered, from an inattention to its mechanism: for we need only to observe the pressure of the water, which acts at a great distance from the centre of gravity G, about which the ship is supposed to turn, and we shall easily perceive the difference there is between the effort of the water against the helmsman, and the effect of the same impulse against the vessel. With regard to the person who steers, the water acts only with the arm of a very short lever NB, of which B is the fulcrum: on the contrary, with regard to the ship, the force of the water is impressed in the direction NP, which passes to a great distance from G, and acts upon a very long lever EG, which renders the action of the rudder extremely powerful in turning the vessel; so that, in a large ship, the rudder receives a shock from the water of 2700 or 2800 pounds, which is frequently the case when she sails at the rate of three or four leagues by the hour; and this force being applied in E, perhaps 100 or 110 feet distant from the centre of gravity G, will operate upon the ship, to turn her about, with 270,000 or 308,000 pounds; whilst, in the latter case, the helmsman acts with an effort which exceeds not 30 pounds upon the spokes of the wheel.

After what has been said of the helm, it is easy to judge, that the more a ship increases her velocity with regard to the sea, the more powerful will be the effect of the rudder; because it acts against the water with a force, which increases as the square of the swiftness of the fluid, whether the ship advances or retreats; or, in other words, whether she has head-way or stern-way; with this distinction, that in these two circumstances the effects will be contrary. For if the vessel retreats, or moves altern, the helm will be impressed from I to N; and instead of being pushed, according to NP, it

Helmet
||
Helos.

will receive the effort of the water from N towards R; so that the stern will be transported to the same movement, and the head turned in a contrary direction.

When the helm operates by itself, the centre of rotation of the ship, and her movement, are determined by estimating the force of this machine; that is to say, by multiplying the surface of the rudder by the square of the ship's velocity.

There are several terms in the sea-language relating to the helm; as, *Bear up the helm*; that is, Let the ship go more large before the wind. *Helm a mid-ship*, or *right the helm*: that is, Keep it even with the middle of the ship. *Port the helm*, Put it over the left side of the ship. *Starboard the helm*, Put it on the right side of the ship.

HELMET, an ancient defensive armour worn by horsemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front secured by bars, which was called the *visor*.

In achievements, it is placed above the escutcheon for the principal ornament, and is the true mark of chivalry and nobility. Helmets vary according to the different degrees of those who bear them. They are also used as a bearing in coats of arms. See HERALDRY.

HELMINTHOLITHUS, in natural history, a name given by Linnæus to petrified bodies resembling worms.

Of these he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified shells. 3. Petrified zoophytes. 4. Petrified reptiles.

HELMONT (John Baptist Van), a celebrated Flemish gentleman, was born at Brussels in 1577. He acquired such skill in natural philosophy, physic, and chemistry, that he was accounted a magician, and thrown into the inquisition: but having with difficulty justified himself, as soon as he was released he retired to Holland; where he died in 1644. He published, 1. *De magnetica corporum curatione*. 2. *Februm doctrina inaudita*. 3. *Ortus medicinæ*. 4. *Parodoxa de aquis spadanis*; and other works, printed together in one volume folio.

HELMONT, a small town in the Netherlands, in Dutch Brabant, and capital of the district of Peeland, with a good castle. It is seated on the river Aa, in E. Long. 5. 37. N. Lat. 51. 31.

HELMSTADT, a town of Germany, in the duchy of Brunswick, built by Charlemagne, in E. Long. 11. 10. N. Lat. 52. 20.

HELMSTADT, a strong maritime town of Sweden, and capital of the province of Holland, seated near the Baltic Sea; in E. Long. 21. 5. N. Lat. 56. 44.

HELONIAS, in botany: A genus of the trigynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 10th order, *Coronariæ*. The corolla is hexapetalous; there is no calyx; and the capsule is trilocular.

HELOISE, famous for her unfortunate affection for her tutor Abelard, and for her Latin letters to him after they had retired from the world. She died abbess of Paraclet in 1163. See ABELARD.

HELOS, (anc. geog.), a maritime town of Laconia, situated between Trinasus and Acrisæ, in Pausanias's time in ruins. The district was called *Helotea*, and the people *Helotes*, *Helotæ*, *Helei*, and *Heleatæ*, by Stephanus; and *Ilota*, by Livy. Being subdued by the Lacedæmonians, they were all reduced to a state of public slavery, or made the slaves of the public, on these conditions, viz. that they neither could recover their liberty nor be sold out of the territory of Sparta. Hence the term *εἰλωτοὶ*, in Harpocration, for being in a state of slavery; and hence also the Lacedæmonians called the slaves of all nations whatever *helotes*. *Heloticus* is the epithet.

HELOTS, in Grecian antiquity, the slaves of the Spartans. See HELOS.—The freemen of Sparta were forbidden the exercise of any mean or mechanical employment, and therefore the whole care of supplying the city with necessaries devolved upon the Helots.

HELSINBURG. See ELSIMBURG.

HELSINGIA, a province of Sweden, bounded on the north by Jemterland and Medelpadia, on the east by the Bothnic gulf, and on the south and west by Dalecarlia and Gestricia. It is full of mountains and forests, and the inhabitants are almost constantly employed in hunting and fishing. It has no cities; the principal towns are, Hudwickvald, Alta, and Dillsbo.

HELSINGIC CHARACTER, a peculiar kind of character found inscribed on stones in the province of Helsingia. The Runic and Helsingic characters may be easily transformed into each other.

HELSTON, a town of Cornwall in England, seated on the river Cober, near its influx into the sea. It is one of those appointed for the coinage of tin, and the place of assembly for the west division of the shire. By a grant of Edward III. it has a market on Saturday, and fairs on March 13th, July 20th, September 9th, November 8th, the second Saturday before St Thomas's day, and the Saturday before Midlent-Sunday, Palm-Sunday, and Whit-Monday. It had formerly a priory and a castle, and sent members to parliament in the reign of Edward I. but was not incorporated till the 27th of queen Elizabeth, who appointed a mayor, to be chosen on September 29. and four aldermen, who are to be of the common-councilmen, and to chuse 24 assistants; it was re-incorporated August 16. 1774. Here is a large market-house and a guild-hall, and four streets that lie in the form of a cross, with a little channel of water running through each. The steeple of the church, with its spire, is 90 feet high, and a sea-mark. A little below the town there is a tolerable good harbour, where several of the tin-ships take in their lading. King John exempted this place from paying toll any where but in the city of London; and from being impleaded any where but in their own borough. It contains about 400 houses, is well inhabited, and sends two members to parliament.

HELVELLA, in botany; a genus of the natural order of fungi, belonging to the cryptogamia class of plants. The fungus is of the shape of a top.

HELVETIC, something that has a relation to the Switzers, or inhabitants of the Swiss cantons, who were anciently called *Helvetii*.—The Helvetic body comprehends the republic of Switzerland, consisting of 13 cantons, which make so many particular commonwealths. By the laws and customs of the Helvetic body, all differences between the several states and republics are to be decided within themselves, without the intervention

Helots
||
Helvetic.

Helvetii of any foreign power. The government of this body is chiefly democratic, with some mixture of the aristocratic.

Helvoet.

HELVETII, a people of Belgica, in the neighbourhood of the Allobroges and the Provincia Romana; famed for bravery and a turn for war. Called *Civitas Helvetia*, and divided into four Pagi or Cantons; situated to the south and west of the Rhine, by which they were divided from the Germans; and extending towards Gaul, from which they were separated by mount Jura on the west, and by the Rhodanus and Lacus Lemanus on the south, and therefore called a Gallic nation (Tacitus, Cæsar, Strabo, Ptolemy, Pliny.) Formerly a part of Celtic Gaul, but by Augustus assigned to Belgica.

HELVETIUS (Adrian), an eminent physician, born in Holland. After having studied physic at Leyden, he went to Paris, where he acquired great reputation in his profession. He introduced in France the use of ipecacuanha in the cure of dysenteries; a remedy which he at first kept secret, but was ordered to make it public, and on that account received a gratification from the king of 1000 louis d'ors. He was made inspector-general of the hospitals in Flanders, physician to the duke of Orleans, regent of France, &c.; and died at Paris, in 1727, aged 65. He wrote a treatise on the most common diseases, and the remedies proper for their cure (the best edition of which is that of 1724, in two volumes octavo); and other works.

HELVETIUS (John-Claude), son of the above, was born in 1685, and died in 1755. He was first physician to the queen, and greatly encouraged by the town as well as court. He was, like his father, inspector-general of the military hospitals. He was of the Academy of Sciences at Paris, of the Royal Society in London, and of the Academies of Prussia, Florence, and Bologna. He is the author of 1. *Idée Générale de l'économie animale*, 1722, 8vo. 2. *Principia Physico-Medica, in tyronum Medicinæ gratiam conscripta*, 2 vols. 8vo.

We may just mention also, that he is the father of the Mons. **HELVETIUS**, who wrote the celebrated book *De l'Esprit*; and whom Voltaire calls "a true philosopher;" but whose book was stigmatized by the authors of the *Journal de Trevoux*, and suppressed by the government.

HELVICUS (Christopher), professor of divinity, Greek, and the Oriental tongues, in the university of Gissen, died in the flower of his age in 1617; after having published several books, and projected more. The Hebrew language was so familiar to him, that he spoke it as fluently as his mother tongue. He was not only a good grammarian, but also an able chronologer. His chronological tables have been greatly esteemed, though they are not free from errors.

HELVIDIANS, a sect of ancient heretics, denominated from their leader Helvidius, a disciple of Auxentius the Arian, whose distinguishing principle was, that Mary, the mother of Jesus, did not continue a virgin, but had other children by Joseph.

HELVOET-SLUYS, a sea-port town of the United Netherlands, seated on the island of Voorn, in the province of Holland, and where the English packet-boat always goes. It is but a small place, consisting only of a handsome quay, and two or three little

VOL. VIII. Part II.

streets. But it is very well fortified, and esteemed the safest harbour in the country. The largest men of war may come up to the middle of the town; and yet it has but very little trade, because the merchants choose to live higher up the country. E. Long. 4. 0. N. Lat. 51. 44.

HEMATH, or **HAMATH**, (anc. geog.), the name of a city (whose king was David's friend, 2 Sam. ix.) to the south of Lebanon; from which a territory was called *Nemath*, on the north of Canaan and south of Syria, as appears by the spies, Numb. xiii. 1 Kings viii. Ezek. xlvii. Whether one or more cities and districts of this name lay in this tract, neither interpreters nor geographers are agreed. The eastern part was called *Hemath zoba*, 2 Chron. viii. unless we suppose that there was a city in Zoba of this name fortified by Solomon. In defining the boundary of Palestine, it is often said, *from the entering of Hamath*; as a province to be entered into through a strait or defile. And if there was such, the next question is, From what metropolis it was called *Hemath*? Antioch, capital of Syria, is supposed to be called *Hemath* or *Amatha*, (Jonathan, Targum, &c.); and again, *Epiphania*, (Josephus.) Both were to the north of Lebanon; consequently not the *Hemath* of Scripture, the immediate boundary of Palestine to the north, and lying to the south of Lebanon.

HEMATITES, See **HÆMATITES**.

HEMELAR (John), an eminent antiquarian, and canon of Antwerp, in the 17th century, was born at the Hague; and wrote a work, entitled, *Expositio Numismatum imperatorum Romanorum à Julio Cæsare ad Heraclium*; which is very scarce, though it has had several editions.

HEMEROBAPTISTS, a sect among the ancient Jews, thus called from their washing and bathing every day, in all seasons; and performing this custom with the greatest solemnity, as a religious rite necessary to salvation.

Epiphanius, who mentions this as the fourth heresy among the Jews, observes, that in other points these heretics had much the same opinions as the Scribes and Pharisees; only that they denied the resurrection of the dead, in common with the Sadducees, and retained a few other of the improprieties of these last.

The sects who pass in the East under the denomination of Sabians, calling themselves *Mendai Iabi*, or *the disciples of John*, and whom the Europeans entitle *the Christians of St. John*, because they yet retain some knowledge of the gospel, is probably of Jewish origin, and seems to have been derived from the ancient Hemerobaptists; at least it is certain, that that John, whom they consider as the founder of their sect, bears no sort of similitude to John the Baptist, but rather resembles the person of that name whom the ancient writers represent as the chief of the Jewish Hemerobaptists. These ambiguous Christians dwell in Persia and Arabia, and principally at Bassora; and their religion consists in bodily washings, performed frequently, and with great solemnity, and attended with certain ceremonies which the priests mingle with this superstitious service.

HEMERÓBIUS, in zoology: A genus of insects of the neuroptera order; the characters of which are these.

Barbut's
Insects.

these. The mouth is furnished with two teeth; the palpi are four; the wings are deflected, but not plaited; and the antennæ are bristly, and longer than the breast. There are 15 species, principally distinguished by their colours.—This insect takes the name of *hemerobius* from the shortness of its life, which, however, continues several days. In the state of larva it is a great devourer of plant-lice, for which it has had bestowed upon it the appellation of *lion of the plant-lice*. The hemerobii, even after their transformation, preserve their carnivorous inclination. Not satisfied with making war upon the plant-lice, who tamely let themselves be devoured, they do not spare each other. The eggs of this insect are borne upon small pedicles, which are nothing but a gum spun out by the hemerobius by raising up the hinder part of its abdomen, and by that means the egg remains fastened to the upper part of the thread. Those eggs are deposited upon leaves, and set in the form of bunches. They have been taken for parasitic plants. The larva, when hatched, finds there its food in the midst of plant-lice. In 15 or 16 days it has attained to its full growth. With its spinning-wheel at its tail, it makes itself a small, round, white, silky cod, of a close texture. In summer, at the end of three weeks, the hemerobius issues forth with its wings; but when the cod has not been spun till autumn, the chrysalis remains in it the whole winter, and does not undergo its final metamorphosis till the ensuing spring. The flight of this insect is heavy: some species have an excrementitious smell. One goes by the name of the *water-hemerobius*, because it lives mostly at the water-side.

HEMEROCALLIS, DAY-LILY, or *lily-asphodel*: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 10th order, *Coronaria*. The corolla is campanulated, with the tube cylindrical; the stamina declining downwards.

Species. 1. The flava, or yellow day-lily, hath strong fibrous roots, sending up large hollow keel-shaped leaves, two feet long, upright, leafless firm stalks, two feet high; dividing at top into several foot-stalks, each terminated by one large lilaceous yellow flower of an agreeable odour. Of this there is a variety called the *hemerocallis minor*, or small yellow day-lily. 2. The fulva, reddish, or copper-coloured day-lily, hath roots composed of strong fleshy fibres and large oblong tubes; radical, keel-shaped, hollow, pointed leaves, a yard long, reflected at top; with leafless stalks three or four feet high, and large copper-coloured lilaceous flowers. These have large stamina, charged with a kind of brown-coloured farina; which, on being touched or smelled to, is discharged in great plenty all over the hands and face.

Culture. Both these species are hardy, and will thrive any where. They may be easily propagated by parting their roots in autumn, or almost any time after flowering, or before they begin to flower.

HEMERODROMI, (compounded of *hemera* "day," and *dromos* "course," &c.) among the ancients, were centinels or guards, appointed for the security and preservation of cities and other places. They went out of the city every morning, as soon as the gates were opened, and kept all day patrolling round the place; sometimes also making excursions farther into the country,

to see that there were no enemies lying in wait to surprise them.

HEMERODROMI were also a sort of couriers among the ancients, who only travelled one day, and then delivered their packets or dispatches to a fresh man, who run his day, and so on to the end of the journey. The Greeks had of these sort of couriers, which they derived from the Persians, who were the inventors thereof, as appears from Herodotus. Augustus had the same; at least he established couriers, who, if they did not relieve each other from day to day, yet did it from space to space, and that space was not very great.

HEMEROTROPHIS, in antiquity, a measure of capacity, the same with the *choenix*. It was so called from its holding one day's food. The word is compounded of *hemera* a day, and *trophis* food.

HEMI, a word used in the composition of divers terms. It signifies the same with *semi* or *demi*, viz. "half;" being an abbreviature of *hemisus* *hemisys*, which signifies "the same." The Greeks retrenched the last syllable of the word *hemisus* in the composition of words; and after their example, we have done so too in most of the compounds borrowed from them.

HEMICRANIA, in medicine, a species of cephalalgia, or head-ach; wherein only one side of the head is affected; and owing to a congestion of blood in the vessels of that half.

HEMICYCLE, **HEMICYCLIUM**, compounded of *hemisus* half, and *kyklos* circle, a semicircle.

HEMICYCLE is particularly applied, in architecture, to vaults in the cradle form; and arches or sweeps of vaults, constituting a perfect semicircle. To construct an arch of hewn stone, they divide the hemicycle into so many voussiors; taking care to make them an uneven number, that there be no joint in the middle, where the key-stone should be. See **KEY** and **BRIDGE**.

HEMICYCLIUM was also a part of the orchestra in the ancient theatre. Scaliger, however, observes, it was no standing part of the orchestra; being only used in dramatic pieces, where some person was supposed to be arrived from sea, as in Plautus's *Rudens*.

The ancients had also a sort of sun-dial, called *hemicyclium*. It was a concave semicircle, the upper end or cusp whereof looked to the north. There was a style, or gnomon, issuing from the middle of the hemicycle, whereof that point corresponding to the centre of the hemicycle represented the centre of the earth; and its shadow projected on the concavity of the hemicycle, which represented the space between one tropic and another, the sun's declination, the day of the month, hour of the day, &c.

HEMIMERIS, in botany; a genus of the angiospermia order, belonging to the didynamia class of plants. The capsule is bilocular, with one of the cells more gibbous than the other: the corolla is wheel-shaped; with one division greater, and inverse heart-shaped; the interstice of the divisions nectar-bearing.

HEMINA, in Roman antiquity, a liquid measure, which, according to Arbuthnot, was equal to half a wine-pint English measure; its contents being 2.818 solid inches.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine, and expressing the half of their obolus, or the twelfth part of a dram, that is, five grains.

HEMI-

Hemero-
dromi
Hemiob-
olon.

Hemionitis

Hemp.

HEMIONITIS, in botany: A genus of the natural order of filices, belonging to the cryptogamia class of plants. The fructifications are in lines decussating or crossing each other.

HEMIPLEGIA, or **HEMIPLEXIA**, among physicians, a palsy of one half of the body. See (the *Index* subjoined) to **MEDICINE**.

HEMIPTERA, derived from *hemis* half, and *pteron* wing, in the Linnæan system, the second order of insects, comprehending twelve genera, viz. the *blatta*, *mantis*, *gryllus*, *fulgura*, *cicada*, *notonecta*, *nepa*, *cimex*, *aphis*, *chermes*, *coccus*, and *thrips*; and a great number of species. See **ENTOMOLOGY**, **INSECTS**, and **ZOOLOGY**.

HEMISPHERE, (**HEMISPHERIUM**, compounded of *hemis* half, and *sphaera* sphere, in geometry, is one half of a globe or sphere, when divided into two by a plane passing through its centre.

HEMISPHERE, in astronomy, is particularly used for one half of the mundane sphere.

The equator divides the sphere into two equal parts, called the *northern* and *southern hemispheres*. The horizon also divides the sphere into two parts, called the *upper* and the *lower hemispheres*.

HEMISPHERE is also used for a map, or projection, of half the terrestrial globe, or half the celestial sphere, on a plane. Hemispheres are frequently called *planispheres*.

HEMISTICH, in poetry, denotes half a verse, or a verse not completed.

Of this there are frequent examples in Virgil's *Æneid*; but whether they were left unfinished by design or not, is disputed among the learned: such are, *Ferro accincta vocat*, *Æn.* II. v. 614. And, *Italiam non sponte sequor*, *Æn.* IV. v. 361.

In reading common English verses, a short pause is required at the end of each hemistich or half-verse.

HEMITONE, in the ancient music, was what we now call a half note or semitone.

HEMITRITÆUS, in medicine, a kind of fever, denoting the same as semi-tertian, returning twice every day. The word is Greek, and compounded of *hemis* half, and *tritai* third or tertian.

HEMLOCK, in botany. See **CICUTA** and **CONIUM**.

HEMOIPTOTON. See **ORATORY**, n° 77.

HEMP. See **CANNABIS**.—It does not appear that the ancients were acquainted with the use of hemp, in respect of the thread it affords. Pliny, who speaks of the plant in his natural history, lib. xx. cap. 23. says not a word of this; contenting himself with extolling the virtues of its stem, leaves, and root. In effect, what some writers of the Roman antiquities remark, viz. that the hemp necessary for the use of war was all stored up in two cities of the western empire, viz. at Ravenna and Vienne, under the direction of two procurators, called *procuratores linificii*, must be understood of linum or flax.

The use of hemp is so extensive and important, that vast quantities of it are annually imported into this and other kingdoms from those countries where it grows in greatest plenty, of which Russia is one. In the year 1763, the quantity imported into England alone amounted to 11,000 tons. Sir John Sinclair informs us, that in the year 1785, the quantity exported from Petersburg in British ships was as follows.

		Poods.	Hemp.
Clean hemp	- - -	1,038,791	
Outshot	- - -	37,382	
Half-clean	- - -	18,374	
Hemp-codille	- - -	19,251	
		1,113,798	

Now, allowing 63 poods to a ton, the quantity just mentioned will amount to 17,695 tons; and supposing it to take five acres to produce a ton of hemp, the whole quantity of ground requisite for this purpose would amount to 88,475 acres.

By other accounts, the annual export of hemp to England is valued at 400,000 l.; but by a computation of the whole imported into Britain and Ireland in 1788, it would seem that a considerably greater quantity must fall to the share of England. In that year the quantity amounted to no less than 58,464 tons; which at 20l. per ton amounted to 1,269,280l. We cannot wonder at this vast consumpt, when it is considered that the sails and cordage of a first rate man of war require 180,000lb. of rough hemp for their construction; but even this will scarce account for the enormous consumpt in France, which in the year 1783 is said to have amounted to upwards of 400 millions of pounds, or 200,000 tons; of which more than one third was imported.

Only the coarser kinds of hemp are employed in making cordage, the better sorts being used for linen, which though it can never be made so fine as that from flax, is yet incomparably stronger, and equally susceptible of bleaching both in the old and new way. Cloths made of hemp have also this property, that their colour improves by wearing, while that of linen decays. The prices of hemp-linen are various; from 10d. to 4s. 6d. per yard. The low-priced kinds are very generally worn in Suffolk (where hemp is cultivated) by husbandmen, servants, &c. those from 1s. 6d. to 2s. by farmers and tradesmen; and those from 2s. 6d. to 4s. 6d. are frequently preferred by gentlemen to flax-linen, on account of their strength and warmth. The English hemp is much superior in strength to that which grows in any other country. Next to it is the Russian, from which sackings is usually made, as it is sometimes also from the offal of the English kind, but none of the Suffolk hemp is ever made into cordage, on account of its fineness. A considerable quantity of Russian sheeting is imported into England merely on account of its strength, and is much coarser at the price than any other foreign linen.

Besides these uses of hemp, it is said to possess a property as a plant which renders it almost invaluable; viz. that of driving away almost all insects that feed upon other vegetables. Hence in some places of the continent they secure their crops from these mischievous attacks, by sowing a belt of hemp round their gardens, or any particular spot which they wish to preserve.

The important uses of hemp, and the superiority of that produced in Britain to other kinds, have rendered the culture of it an object of attention to government. Accordingly in the year 1787, a bounty of threepence per stone was allowed on all the hemp raised in England; and probably with a view to encourage the growth of English hemp, duties have been laid on that

Hemp.

that which comes from abroad. Dressed hemp in a British ship pays 2l. 4s. per cwt. import duty; in a foreign one 2l. 6s. 9d.; and in both cases a drawback of 1l. 19s. is allowed. Undressed hemp in a British ship pays 3s. 8d.; and in a foreign one 3s. 11d. In both cases the drawback is 3s. 4d. The export of British hemp is free.

The usual height of the plant when growing is from five to six feet, but this varies very considerably according to circumstances. That which is cultivated near Bischwiller in Alsace is sometimes more than 12 feet high, and upwards of three inches in circumference, the stalks being so deeply rooted that a very strong man can scarce pull them up. Mr Arthur Young, in a tour through Catalonia in Spain, says, that where the country is well watered, the crops of hemp are extraordinary; and that the plants generally rise to the height of seven feet. In Italy hemp is generally cultivated, though the Bolognese only can pretend to any superiority in the management of it. It is there sown upon their best lands, which are rich strong loams; and on which they are at all possible pains to procure a fine friable surface. For manure they use dung, pieces of rotten cloth, feathers, and horns brought from Dalmatia. The plant, however, may be cultivated upon ground of every kind; the poorer land producing that which is finer in quality though in smaller quantity; whereas strong and rich land produces a great quantity, but coarser. It does not exhaust the land on which it grows like flax, whence it is probable, that if properly managed, and care taken in the cultivation, it might be found to supersede flax entirely. A Sussex manufacturer, who writes on this subject in the *Annals of Agriculture*, informs us, that it may be raised for many years successively on the same ground, provided it be well manured. An acre requires from nine to twelve pecks, according to the nature of the soil; the latter being the most usual, though a variation in the quality of the soil makes an alteration both in the quantity and quality of the hemp. An acre produces on an average 36 or 38 stone. The abbé Brulle, in a *Treatise upon the Culture and Management of Hemp*, printed by order of the lords of the committee of council for trade and foreign plantations, informs us, that the season for sowing it extends from the 25th of March to the 15th of June. The seed ought always to be sown thin, not exceeding two bushels to an acre; and if you have the advantage of a drill plough, still less will answer. As there are two kinds of hemp, the male and female, of which the former only produces seed, some regard must be had to this circumstance. In Sussex the male and female are pulled together about 13 weeks after the sowing, but in the fens they are frequently separated. This last method is recommended by the abbé Brulle, who, for the more easy accomplishment of it, directs that little paths should be made lengthwise through the field at about seven feet distance from each other, to allow a passage for the person who pulls up the female hemp from among the other; the latter requiring to stand more than a month after for the purpose of ripening the seeds. The female hemp is known to be ripe by the fading of the flowers, the falling of the farina fecundans, and some of the stalks turning yellow. After the whole of this kind is pulled, it must

be manufactured according to the directions to be afterwards given, and ought to be worked if possible while green; the hemp thus produced being much finer than that which is previously dried. The reason of this is, that the plant contains a great quantity of glutinous matter; which being once dried, agglutinates the fibres in such a manner that they can never be afterwards perfectly separated. The female hemp, however, is always in smaller quantity than the male; and therefore where the crop is large, it will be impossible to work the whole as fast as it is pulled or cut. It is known to be ripe by the stems becoming pale; but it must be remembered, that hemp of any kind will be much less injured by pulling the plants before they are ripe than by letting them stand too long.

The male hemp being stripped of its leaves, &c. as afterwards directed, will soon be dry for storing by the heat of the atmosphere, though sometimes it may be necessary to use artificial means; but where these are used, the utmost care must be taken, hemp when dry being exceedingly inflammable. The stored or dried hemp must be steeped and treated in every other respect as though it had been green; whence it is evident that this operation ought never to be used but in cases of necessity. It is likewise impossible to make hemp which has been dried previous to its being steeped so white as that which has been worked green.

With regard to the perfecting of hemp-seed for a subsequent season, it would seem proper to set apart a piece of ground for this purpose; for M. Aimen, from 40 plants raised in the common way, had only a pound and an half of seed, though the plants from which it was taken might be deemed fine; whereas, from a single plant which grew by itself, he had seven pounds and an half. Some are of opinion, that by putting the clusters which contain the hemp-seed to heat and sweat, the quality is improved; as many of those seeds which would otherwise wither and die, may thus arrive at perfection. This, however, seems to be very problematical; as there are no experiments which show that seeds, when separated from the vegetable producing them have any power of meliorating themselves.

After the hemp is pulled, it must be taken in large handfuls, cutting off the roots (though this is not absolutely necessary), the leaves, seeds, and lateral branches, being dressed off with a wooden sword or ripple. It is then to be made up into bundles of twelve handfuls each, in order to be steeped, like flax, in water. This, or something similar, is absolutely necessary, in order to separate the bark; which is properly the hemp, from the reed or woody part. In Suffolk, this operation is called *water-retting*; but sometimes a mere exposure to the air is substituted in its place, turning the hemp frequently during the time it is exposed. This is called *dew-retting*; but the former method is universally deemed preferable. Such hemp as is designed for seed is seldom water-retted, though in the opinion of the manufacturer already quoted, it would be better if it were so. Dew-retted hemp is generally stacked and covered during the winter; in January and February it is spread upon meadow land, and whitens with the frost and snow; though it is always much inferior to the other, and proper for coarser yarns only.

The length of time required for steeping hemp is various,

Hemp.

Mill's Husbandry,
vol. v.

Hemp. various, and a complete knowledge of it can only be attained by practice. In Suffolk it is usual to continue the immersion four, five, or six days; standing water is preferred, and the same water will steep hemp three times during the season, but the first has always the best colour. The abbé Brulle prefers clear and running water, especially if overhung with trees. The bundles are to be laid crosswise upon each other, taking particular notice of the manner in which they lie when put in, that they may be taken out without difficulty. His time of steeping is from six to 11 days; and here we must observe, that it is much better to let it remain too long in the water than too short a time. The slenderest hemp requires the most soaking. The operation is known to be finished by the reed separating easily from the bark.

After the hemp is thoroughly steeped, the next operation is to separate the bark from the reed or woody part; and this may be done in two ways, *viz.* either pulling out the reed from every stalk with the hand, or drying and breaking it like flax. The abbé Brulle is very particular in his directions for this last operation, which he calls *reeding*, and which may be performed either in a trough under water or upon a table. The whole, however, may be reduced to the following, *viz.* pressing down the bundles either in the trough or on a table by proper weights, to keep the hemp steady on the middle and top end. Then beginning at the upper part of the bundle, pull out the reeds one by one. As you proceed, the rind which remains will press closely upon the remaining unreeded hemp, and keep it more steady; so that you may take two, four, or even six stalks, at a time. The weight is then to be removed from the top, and all the pieces of reed which remain there having broken off in the former operation, are to be taken out. Lastly, the middle weight is to be taken off, and any small pieces which remain there taken out. If the reeding is performed on a table, the bundle must be weeded frequently, though slightly; a continual dropping of water would perhaps be the best method.

After the hemp is reeded, it must next be freed from the mucilaginous matter with which it still abounds. This is done by pouring water through it, squeezing out the liquid after every affusion, but taking care not to let the threads twist or entangle each other, which they will be very apt to do. The abbé is of opinion, that soft soap should be dissolved in the last water, in the proportion of an ounce to three pounds of dry hemp; which though not absolutely necessary, contributes much to the softening and rendering the hemp easy and pleasant to dress.

Hemp is broken by machinery, after being steeped, in a manner similar to flax; but the instruments used for this purpose in Suffolk are all worked by the hand. That which breaks in the operation is called *sborts*, and is about half the value of the long hemp. The best water-retted hemp sells for about 8s. 6d. per stone; the other kind from one to two shillings lower.

Beating of hemp is the next operation, which formerly was performed entirely by hand, but now in most places by a water-mill, which raises three heavy beaters that fall upon it alternately; the hemp being turned all the while by a boy in order to receive the strokes equally. The finer it is required to make the

tow, the more beating is necessary. It is then dressed or combed by drawing it through heckles formed like the combs of wool-manufacturers, only fixed. Sometimes it is divided into two or three sorts of tow, and sometimes the whole is worked together into one sort; the prices varying from 6d. to 1s. 6d. per pound.

The hemp thus manufactured is sold to spinners, who reel their yarn as follows.

2 Yards make	-	1 thread.
40 Threads	-	1 lea.
20 Leas	-	1 skain.
3 Skains	-	1 clue of 4800 yards.

It is next delivered to the bleachers, who return it bleached on receiving 20 or 21 clues for every 120 bleached. The prices of the hemp-yarn are as follow:

1 Clue from a pound	-	7d. or 6½d.
1½ from do.	-	8½d. or 8d.
2 from do.	-	9½d. or 9d.
2½ from do.	-	10½d. or 10d.
3 from do.	-	12d.

Chinese HEMP, a newly discovered species of *Cannabis*, of which an account is given in the 72d volume of the Philosophical Transactions p. 46. In that paper Mr Fitz-Gerald, vice president of the society for encouraging arts, mentions his having received the seeds from the late Mr Elliot; which being sown, according to his directions, produced plants 14 feet high, and nearly seven inches in circumference. These being pulled up in November, and steeped for a fortnight in water, were placed against a southern wall to dry. After this the hemp was found to separate easily from the woody part; and so great was the produce, that 32 plants yielded three pounds and a quarter. In consequence of this success, Mr Fitzgerald applied to the directors of the India company to procure some of the seeds from China; which being complied with, the society were furnished, in 1785, with some more of the seeds, which were distributed to several of the members; but, notwithstanding their endeavours, few of the plants appear to have ripened their seeds in this country. Two of the species of hemp, tried by the duke of Northumberland, rose to the height of 14 feet seven inches, and would have been much larger, had they not been hurt by an high wind: another kind arose only to that of three feet and an half, the stem about the size of a common wheat straw; but though it flowered well, did not produce any seed. These kinds were sown in an hot-bed where the heat was very strong, on the 14th of April. They appeared above ground in four days, and were transplanted into pots on the 25th. They were then put under an hot-bed frame where the heat had been gone off, to harden them for the natural ground, in which they were planted on the 30th, by turning them whole out of the pots; letting them, three together, be planted at two feet distance every way; covering them at times for about ten days, until they were supposed to be rooted. Only a few seeds were preserved from plants which had been kept constantly in a stove.

Other trials were attended with little better success; but, in 1786, the Rev. Dr Hinton of Northwold near Brandon, made a successful experiment with some seeds he received from the secretary of the society. They were sown on the 17th of May, and appeared.

Hemp.

Hemp appeared on the 6th of June. The plants were few and sickly; and notwithstanding some fine showers, they continued to languish so much that the experiment was entirely abandoned, and buckwheat was harrowed into the ground for a fallow crop. In the beginning of October, however, the persons employed in cutting the buck-wheat discovered some seed in the heads of a few straggling hemp plants which had been suffered to grow in the crop; which being carefully threshed, afforded three pints of seed tolerably bright and heavy. These seeds were sown on the 10th of May 1787. On the 19th they appeared above the ground numerous and healthy. The male hemp was drawn on the 13th of August, but the female not till the 9th of October; the spot on which the plants were sown measured only 322 square yards, and produced of marketable hemp no less than 95 stone 7 pounds 12 ounces; being upwards of one third more than the best crops of English hemp are ever known to produce. Thus it appeared, that the seeds of the Chinese hemp had retained their superiority over those of the English; though how long they would continue to do so cannot be determined but by experience. For this experiment Dr Hinton received a silver medal from the society. Few of the seeds either of Chinese, or any other hemp, will vegetate if two years old at the time of sowing; and to this circumstance the Doctor attributes the failure of other trials of Chinese hemp.

HEMP-Agrimony, a species of eupatorium. See **EUPATORIUM**.

HEMPSTEAD, a town of Hertfordshire in England, stands among hills, upon a small river called the Gade, and is seven miles to the west of St Alban's, five miles south-east of Berkhamsted, and 20 north-west of London. The church has a handsome tower with a tall spire, and a good ring of bells. It was, in the time of the Saxons, called by the name of Henamsted, or Hean-Hemsted, i. e. High-Hemstead. In William the Conqueror's time, by the name of Hemelamstede. Henry VIII. incorporated this village by the name of a bailiff; and he empowered the inhabitants to have a common-seal, and a pye-powder court during its market and fairs. It has been reckoned one of the greatest markets for wheat in this county, if not in England, 20,000 l. a week being often returned in it only for meal. Eleven pair of mills stand within four miles of the place, which bring a great trade to it; but the road is thereby so continually torn, that it is one of the worst turnpike ways to London.

HEMSKERCK (Egbert), called the *Old*, a celebrated Flemish painter of drolls and conversations, of whom, though so universally known, we have no information as to the time in which he flourished, or the school in which he was taught. Though the taste of his compositions is but low, yet it ought to be considered that he took his subjects from nature; from persons in the meanest occupations, whose dress, actions, and manners, could not furnish the imagination with any ideas of elegance: and to express their passions and undisguised humours, seems to have been the utmost of his ambition. By frequenting fairs, merry-meetings, gaming-houses, and inns, he acquired a surprising power of connecting humorous circumstances,

He designed and drew correctly, and his pictures have a strong effect from his accurate management of the *chiaro obscuro*. Some of his pictures have suffered from unskilful cleaners, and many things are sold as his which dishonour him; but his genuine works, well preserved, have a clearness and force equal to any of the Flemish artists.

HEMSKERCK (Egbert), called the *Young*, was the disciple of Peter Grebber, but imitated the manner of Brouwer and of the elder Hemskerck. He was born at Haerlem in 1645, but settled at London, where for a long time his works were exceedingly esteemed, though they are now much sunk in their value. He had a whimsical imagination, and delighted in composing uncommon and fanciful subjects; such as the temptation of St Anthony, nocturnal intercourses of witches and spectres, enchantments, &c. which he executed with a free pencil and a spirited touch. It was customary with him to introduce his own portrait among the conversations he designed; and for that purpose had a small looking-glass placed near his case. He died in 1704.

HEN-Harrier. See **FALCO**.

HEN-Mould-soil, in agriculture, a term used by the husbandmen in Northamptonshire, and other counties, to express a black, hollow, spongy, and mouldering earth, usually found at the bottoms of hills. It is an earth much fitter for grazing than for corn, because it will never settle close enough to the grain to keep it sufficiently steady while it is growing up, without which, the farmers observe, it either does not grow well; or, if it seem to thrive, as it will in some years, the growth is rank, and yields much straw, but little ear. It is too moist, and to that is principally to be attributed this rankness of the crop in some years; and the occasion of its retaining so much moisture is, that it usually has a bed of stiff clay, which will not let the water run off into the under strata.

In some places they also give this name to a black, rich, and dense earth, with streaks of a whitish mould in many parts. This sort of hen-mould is usually found very rich and fertile.

HENAULT (Charles John Francis), was son of John Remi Henault lord of Mouffy, and born at Paris in 1685. He early discovered a sprightly benevolent disposition, and his penetration and aptness soon distinguished itself by the success of his studies. Claude de Lisle, father of the celebrated geographer, gave him the same lessons in geography and history which he had before given to the duke of Orleans afterwards regent; and which have been printed in seven volumes, under the title of "*Abridgment of Universal History*." On quitting college, Henault entered the Oratory, where he soon attached himself to the study of eloquence: and, on the death of the Abbé Rene, reformer of La Trappe, he undertook to pronounce his panegyric; which not meeting the approbation of father Maffillon, he quitted the Oratory after two years, and his father bought for him, of marechal Villeroi, the "*lieutenance des chasses*," and the government of Corbeil. At the marshal's he formed connections, and even intimate friendships, with many of the nobility.

Henault.

and passed the early part of his life in agreeable amusements, and in the liveliest company, without having his religious sentiments tainted. He associated with the wits till the dispute between Rousseau and de la Motte soon gave him a disgust for these trifling societies. In 1707, he gained the prize of eloquence at the French Academy; and another next year at the academy des jeux Floraux. About this time M. Reaumur, who was his relation, came to Paris, and took lessons in geometry under the same master, Guinée. Henault introduced him to the Abbé Bignon, and this was the first step of his illustrious course. In 1713 he brought a tragedy on the stage, under the disguised name of Fuselier. As he was known to the public only by some slighter pieces, "Cornelia the Vestal" met with no better success. He therefore locked it up without printing. In his old age his passion for these subjects reviving, and Mr Horace Walpole being at Paris in 1768, and having formed a friendship with him as one of the most amiable men of his nation, obtained this piece, and had it printed at a press which he had at his country seat, from whence a beautiful edition of Lucan had before issued. In 1751 M. Henault, under a borrowed name, brought out a second tragedy, intitled, "Marius," which was well received and printed. He had been admitted counsellor in parliament in 1706, with a dispensation on account of age; and in 1710 president of the first chamber of inquests. These important places, which he determined to fill in a becoming manner, engaged him in the most solid studies. The excellent work of M. Domat charmed him, and made him eager to go back to the fountain head. He spent several years in making himself master of the Roman law, the ordonnances of the French king, their customs, and public law. M. de Morville, procureur-general of the great council, being appointed ambassador to the Hague in 1718, engaged M. Henault to accompany him. His personal merit soon introduced him to the acquaintance of the most eminent personages at that time there. The grand pensionary, Heinsius, who, under the exterior of Lacedemonian simplicity, kept up all the haughtiness of that people, lost with him all that hauteur which France itself had experienced from him in the negotiations of the treaty of Utrecht. The agitation which all France felt by Law's system, and the consequent sending of the parliament into exile, was a trial to the wise policy of the president Henault. His friendship for the first president, De Mesmes, led him to second all the views of that great magistrate: he took part in all the negotiations, and was animated purely by the public good, without any private advantage. On the death of the cardinal du Bois, in 1723, he succeeded in his place at the French Academy. Cardinal Fleury recommended him to succeed himself as director, and he pronounced the eloge of M. de Malezieux.

History was M. Henault's favourite study; not a bare collection of dates, but a knowledge of the laws and manners of nations; to obtain which he drew instruction from private conversations, a method he so strongly recommends in his preface. After having thus discussed the most important points of our public law, he undertook to collect and publish the result of his inquiries, and he is deservedly accounted the first framer of chronological abridgements; in which, without stopping at detached

facts, he attends only to those which form a chain of events that perfect or alter the government and character of a nation, and traces only the springs which exalt or humble a nation, extending or contracting the space it occupies in the world. His work has had the fortune of those literary phenomena, where novelty and merit united excite minds eager after glory, and fire the ardour of young writers to press after a guide whom few can overtake. The first edition of the work, the result of 40 years reading, appeared in 1744, under the auspices of the chancellor Daguesseau, with the modest title of *an Essay*. The success it met with surprised him. He made continual improvements in it, and it has gone through nine editions, and been translated into Italian, English, and German, and even into Chinese. As the best writings are not secure from criticism, and are indeed the only ones that deserve it, the author read to the academy of Belles Lettres a defence of his abridgement. All the ages and events of the French monarchy being present to his mind, and his imagination and memory being a vast theatre whereon he beheld the different movements and parts of the actors in the several revolutions, he determined to give a specimen of what past in his own mind, and to reduce into the form of a regular drama, one of the periods of French history, the reign of Francis II. which, though happy only by being short, appeared to him one of the most important by its consequences, and most easy to be confined within the stage bounds. His friend the chancellor highly approved the plan, and wished it to be printed. It accordingly went through five editions; the harmony of dates and facts is exactly observed in it, and the passions interested without offence to historic truth.

In 1755, he was chosen an honorary member of the academy of Belles Lettres, being then a member of the academies of Nanci, Berlin, and Stockholm. The queen appointed him superintendant of her house. His natural sprightliness relieved her from the serious attendance on his private morning lectures. The company of persons most distinguished by their wit and birth, a table more celebrated for the choice of the guests than its delicacies, the little comedies suggested by wit, and executed by reflections, united at his house all the pleasures of an agreeable and innocent life. All the members of this ingenious society contributed to render it agreeable, and the president was not behind any. He composed three comedies: *La Petite Maison*, *La Jaloux de Soi meme*, and *Le Reveil d'Epimenide*. The subject of the last was the Cretan philosopher, who is pretended to have slept 27 years. He is introduced fancying that he had slept but one night, and astonished at the change in the age of all around him: he mistakes his mistress for his mother; but discovering his mistake, offers to marry her, which she refuses, though he still continues to love her. The queen was particularly pleased with this piece. She ordered the president to restore the philosopher's mistress to her former youth: he introduced Hebe, and this episode produced an agreeable entertainment. He was now in such favour with her majesty, that on the place of superintendant becoming vacant by the death of M. Bernard de Conbert master of requests, and the sum he had paid for it being lost to his family, Henault solicited it in favour of several persons, till at last the queen

Henault

||

Henley.

queen bestowed it on himself, and consented that he should divide the profits with his predecessor's widow. On the queen's death he held the same place under the dauphiness.

A delicate constitution made him liable to much illness; which, however, did not interrupt the serenity of his mind. He made several journeys to the waters of Plombieres: in one of these he visited the deposed king Stanislaus at Luneville; and in another accompanied his friend the marquis de Pauliny, ambassador to Switzerland. In 1763 he drew near his end. One morning, after a quiet night, he felt an oppression, which the faculty pronounced a suffocating cough. His confessor being sent to him, he formed his resolution without alarm. He has since said, that he recollected having then said to himself, "What do I regret?" and called to mind that saying of Madame de Sevigne, "I leave here only dying creatures." He received the sacraments. It was believed the next night would be his last; but by noon next day he was out of danger. "Now (said he) I know what death is. It will not be new to me any more." He never forgot it during the following seven years of his life, which, like all the rest, were gentle and calm. Full of gratitude for the favours of Providence, resigned to its decrees, offering to the Author of his being a pure and sincere devotion; he felt his infirmities without complaining, and perceived a gradual decay with unabated firmness. He died Dec. 24. 1771, in his 86th year. He married in 1714 a daughter of M. le Bas de Montargis keeper of the royal treasure, &c. who died in 1728 without leaving any issue.

HENDECAGON, in geometry, a figure that hath eleven sides and as many angles.

HENED-PENNY, in our old writers, a customary payment of money instead of hens at Christmas. It is mentioned in a charter of king Edward III. Mon. Angl. tom. ii. p. 327. Du-Cange is of opinion it may be *hen-penny*, *gallinagium*, or a composition for eggs; but Cowel thinks it is misprinted *hened-penny* for *beved-penny*, or *head-penny*.

HENLEY, a town of Oxfordshire in England, seated on the river Thames, over which there is a handsome bridge. It sends malt, corn, and other things, to London in barges. W. Long. o. 40. N. Lat. 51. 34.

HENLEY, a town of Warwickshire in England, seated on the river Alne, in W. Long. 1. 45. N. Lat. 52. 18.

HENLEY (John), better known by the appellation of *Orator Henley*, a very singular character, was born at Melton-Moubray, Leicestershire, in 1691. His father, the Rev. Simon Henley, and his grandfather by his mother's side (John Dowel, M. A.), were both vicars of that parish. Having passed his exercises at Cambridge, and his examination for the degree of B. A. with the particular approbation of Mr Field, Mr Smales, and the master of the college, he returned to his native place, where he was first desired by the trustees of the school in Melton to assist in, and then to take the direction of that school; which he increased and raised from a declining to a flourishing condition. He established here a practice of improving elocution by the public speaking of passages in the classics, morning and afternoon, as well as orations, &c. Here he was invited

Nº 151.

by a letter from the Rev. Mr Newcombe to be a candidate for a fellowship in St John's; but as he had long been absent, and therefore lessened his personal interest, he declined appearing for it. Here likewise he began his "Universal Grammar," and finished ten languages, with dissertations prefixed, as the most ready introduction to any tongue whatever. In the beginning of this interval he wrote his poem on "Esther," which was approved by the town, and well received. He was ordained a deacon by Dr Wake, then bishop of Lincoln; and after having taken his degree of M. A. was admitted to priest's orders by Dr Gibson, his successor in that see. He formed an early resolution to improve himself in all the advantages of books and conversation the most effectually, on the first opportunity, at London. But he laid the basis of future proficiency in assisting at the curacy of his native town; where he preached many occasional sermons, particularly one at the assizes at Leicester: he then gave a voluntary warning for the choice of a new master and curate, and came to town recommended by above 30 letters from the most considerable men in the country, both of the clergy and laity; but against the inclination of his neighbours and his school, which was now, as from his first entrance upon it, still advancing: and his method being established and approved, one of his own scholars was appointed to succeed him.—In town he published several pieces, as a translation of Pliny's Epistles, of several works of Abbé Vertot, of Montfaucon's Italian Travels in folio, and many other lucubrations. His most generous patron was the earl of Macclesfield, who gave him a benefice in the country, the value of which to a resident would have been above 80 l. a-year; he had likewise a lecture in the city; and preached more charity-sermons about town, was more numerously followed, and raised more for the poor children, than any other preacher, however dignified or distinguished. But when he pressed his desire and promise from a great man of being fixed in town, it passed in the negative. He took the people (it seems) too much from their parish-churches; and as he was not so proper for a London divine, he was very welcome, notwithstanding all difficulties, to be a rural pastor. But it was not for a second rustication, as he informs us†, that he left the fields and the swains of Arcadia to visit the great city; and as he knew it was as lawful to take a licence from the king and parliament at Hicks's-hall as at Doctors Commons (since the ministerial powers of this kingdom are and ought to be parliamentary only), he freely, without compulsion, or being desired or capable of being compelled to reside in the country, gave up his benefice and lecture, certainties for an uncertainty; believing the public would be a more hospitable protector of learning and science, than some of the upper world in his own order.

Mr Henley, in answer to a cavil (that he borrowed from books), proposed, "that if any person would single out any celebrated discourse of an approved writer, dead or living, and point out what he thought excellent in it, and the reasons; he would submit it to the world, whether the most famed composition might not be surpassed in their own excellency, either on that or any different subject."

Henley preached on Sundays upon theological matters, and on Wednesdays upon all other sciences. He declaimed

Henley.

† *Oratory Transact.* p. 12, &c.

Henley ||
Henot-
cum. declaimed some years against the greatest persons, and occasionally, says Warburton, did Pope that honour. The poet in return thus blazons him to infamy :

" But, where each science lifts its modern type,
" History her pot, Divinity his pipe,
" While proud Philosophy repines to show,
" Dishonest sight ! his breeches rent below ;
" Imbrow'd with native bronze, lo Henley stands,
" Tuning his voice, and balancing his hands.
" How fluent nonsense trickles from his tongue !
" How sweet the periods, neither said nor sung !
" Still break the benches, Henley ! with thy strain,
" While Kennet, Hare, and Gibson preach in vain,
" O great restorer of the good old stage,
" Preacher at once and Zany of thy age !
" O worthy thou of Ægypt's wife abodes,
" A decent priest where monks were the gods !
" But Fate with butchers plac'd thy priestly stall,
" Meek modern faith to murder, hack, and maul :
" And bade thee live to crown Britannia's praise,
" In Toland's, Tindal's, and in Woolston's days."

This extraordinary person (who died October 14. 1756) struck medals, which he dispersed as tickets to his subscribers : a star rising to the meridian, with this motto, *Ad summa* ; and below, *Inveniam viam, aut faciam*. Each auditor paid 1 s. He was author of a weekly paper called *The Hyp Doctor*, for which he had 100l. a year given him. Henley used every Saturday to print an advertisement in the *Daily Advertiser*, containing an account of the subjects he intended to discourse on the ensuing evening at his oratory near Lincoln's-inn-fields, with a sort of motto before it, which was generally a sneer at some public transaction of the preceding week. Dr Cobden, one of Geo. II.'s chaplains, having, in 1748, preached a sermon at St James's from these words, " Take away the wicked from before the king, and his throne shall be established in righteousness ;" it gave so much displeasure, that the Doctor was struck out of the list of chaplains ; and the next Saturday the following parody of his text appeared as a motto to Henley's advertisement :

" Away with the wicked before the king,
" And away with the wicked behind him ;
" His throne it will bless
" With righteousness,
" And we shall know where to find him."

His audience was generally composed of the lowest ranks ; and it is well known that he even collected an infinite number of shoe-makers, by announcing that he could teach them a speedy mode of operation in their business, which proved only to be, the making of shoes by cutting off the tops of ready-made boots.

HENNA, or ALHENNA. See LAWSONIA.

HENNEBERG, a county of Germany, in the circle of Franconia. It is bounded on the north by Thuringia, on the west by Hesse, on the south by the bishoprick of Wertsburg, and on the east by that of Bamberg. It abounds in mountains and woods ; and it is populous, and pretty fertile. Mainingen is the capital town.

HENNEBERG, a town of Germany, in the circle of Franconia, which gives title to a county of the same name with a castle. E. Long. 9. 17. N. Lat. 50. 40.

HENNEBON, a town of France in Bretagne, in the diocese of Vannes. It is inhabited by rich merchants, and is seated on the river Blavet, in W. Long. 2. 13. N. Lat. 47. 48.

HENOTICUM, (ἡνωτικόν, q. d. " reconciliative ;" of ἡνω " I unite"), in church history, a famous edict of the emperor Zeno, published A. D. 482, and intended

to reconcile and reunite the Eutychians with the Catholics. It was procured of the emperor by means of Acacius, patriarch of Constantinople, with the assistance of the friends of Peter Mongus and Peter Trullo. The sting of this edict lies here ; that it repeats and confirms all that had been enacted in the councils of Nice, Constantinople, Ephesus, and Chalcedon, against the Arians, Nestorians, and Eutychians, without making any particular mention of the council of Chalcedon. It is in form of a letter, addressed by Zeno to the bishops, priests, monks, and people of Egypt and Libya. It was opposed by the Catholics, and condemned in form by pope Felix II.

HENRICIANS, in ecclesiastical history, a sect so called from Henry its founder, who, though a monk and hermit, undertook to reform the superstition and vices of the clergy. For this purpose he left Lausanne in Switzerland, and removing from different places, at length settled at Tholouse in the year 1147, and there exercised his ministerial function, till being overcome by the opposition of Bernard abbot of Clairval, and condemned by pope Eugenius III. at a council assembled at Rheims, he was committed to a close prison in 1148, where he soon ended his days. This reformer rejected the baptism of infants ; severely censured the corrupt manners of the clergy ; treated the festivals and ceremonies of the church with the utmost contempt, and held clandestine assemblies for inculcating his peculiar doctrines.

HENRY, or CAPE-HENRY, the south cape of Virginia, at the entrance of Chesapeake-bay. W. Long. 74. 50. N. Lat. 37. 0.

HENRY, the name of several emperors of Germany, and kings of England and France. See ENGLAND, FRANCE, and GERMANY.

HENRY IV. emperor of Germany in 1056, styled *the Great*, was memorable for his quarrels with pope Gregory II. whom at one time he deposed, for having presumed to judge his sovereign ; but at another, dreading the effects of the papal anathemas, he had the weakness to submit to the most humiliating personal solicitations and penances to obtain absolution ; which impolitic measure increased the power of the Pope, and alienated the affections of his subjects : thus circumstanced, he reassumed the hero, but too late ; marched with an army to Rome, expelled Gregory, deposed him, and set up another pope. Gregory died soon after : but Urban II. and Pascal II. successively, excited his ambitious sons, Conrad and Henry, to rebel against him, and the latter was crowned emperor by the title of Henry V. in 1106 ; and he had the inhumanity to arrest his father, and to deprive him, not only of all his dignities, but even of the necessaries of life. The unfortunate Henry IV. was reduced to such extremities (after having fought 62 battles in defence of the German empire), that he solicited the bishop of Spire to grant him an underchaunter's place in his cathedral, but was refused. He died the same year at Liege, aged 55, a martyr to the ignorance and superstition of the age, and to his own blind confidence in favourites and mistresses.

HENRY IV. king of France (in 1589) and Navarre, justly styled *the Great*, was the son of Anthony de Bourbon, chief of the branch of Bourbon (so called from a fief of that name which fell to them by marriage with the heiress of the estate). His mother was

Henry. the daughter of Henry d'Albert, king of Navarre; a woman of a masculine genius; intrepid, simple, and rustic in her manners, but deeply versed in politics, and a zealous Protestant. Foreseeing that her party would want such a protector (for her husband was a weak indolent prince), she undertook the care of the education of the young hero: his diet was coarse; his clothes neat, but plain; he always went bare-headed; she sent him to school with the other children of the same age, and accustomed him to climb the rocks and neighbouring mountains, according to the custom of the country. He was born in 1553; and in 1569, the 16th year of his age, he was declared the Defender and Chief of the Protestants at Rochelle. The peace of St Germain, concluded in 1570, recalled the lords in the Protestant interest to court; and in 1572 Henry was married to Margaret de Valois, sister to Charles IX. king of France. It was in the midst of the rejoicings for these nuptials that the horrid massacre of Paris took place. Henry was reduced, by this infernal stroke of false policy, to the alternative of changing his religion or being put to death: he chose the former, and was detained prisoner of state three years. In 1587 he made his escape; put himself at the head of the Huguenot party, exposing himself to all the risks and fatigues of a religious war, often in want of the necessaries of life, and enduring all the hardships of the common soldier: but he gained a victory this year at Courtras, which established his reputation in arms, and endeared him to the Protestants. On the death of Henry III. religion was urged as a pretext for one half of the officers of the French army to reject him, and for the leaguers not to acknowledge him. A phantom, the cardinal de Bourbon, was set up against him; but his most formidable rival was the duke de Mayenne: however, Henry, with few friends, fewer important places, no money, and a very small army, supplied every want by his activity and valour. He gained several victories over the duke; particularly that of Ivry in 1590, memorable for his heroic admonition to his soldiers: "If you love your ensigns, rally by my white plume, you will always find it in the road to honour and glory." Paris held out against him, notwithstanding his successes; he took all the suburbs in one day; and might have reduced the city by famine, if he had not humanely suffered his own army to relieve the besieged; yet the bigotted friars and priests in Paris all turned soldiers, except four of the Mendicant order; and made daily military reviews and processions, the sword in one hand and the crucifix in the other, on which they made the citizens swear rather to die with famine than to admit Henry. The scarcity of provisions in Paris at last degenerated to an universal famine; bread had been sold, whilst any remained, for a crown the pound, and at last it was made from the bones of the charnel-house of St Innocents; human flesh became the food of the obstinate Parisians, and mothers ate the dead bodies of their children. In fine, the duke of Mayenne, seeing that neither Spain nor the league would ever grant him the crown, determined to assist in giving it to the lawful heir. He engaged the states to hold a conference with the chiefs of both parties; which ended in Henry's abjuration of the Protestant religion at St Dennis, and his consecration at Chartres in 1593. The following year Paris opened its gates to him; in

1596, the duke of Mayenne was pardoned; and in 1598, peace was concluded with Spain. Henry now showed himself doubly worthy of the throne, by his encouragement of commerce, the fine arts, and manufactures, and by his patronage of men of ingenuity and sound learning of every country: but though the fermentations of Romish bigotry were calmed, the leaven was not destroyed; scarce a year passed without some attempt being made on this real father of his people; and at last the monster Ravaillac stabbed him to the heart in his coach, in the streets of Paris, on the 14th of May 1610, in the 57th year of his age and 22d of his reign.

HENRY VIII. king of England, was the second son of Henry VII. by Elizabeth the eldest daughter of Edward IV. He was born at Greenwich, on the 28th of June 1491. On the death of his brother Arthur, in 1502, he was created prince of Wales; and the following year betrothed to Catharine of Aragon, prince Arthur's widow, the Pope having granted a dispensation for that purpose. Henry VIII. acceded to the throne, on the death of his father, the 22d of April 1509, and his marriage with Catharine was solemnized about two months after. In the beginning of his reign he left the government of his kingdom entirely to his ministers; and spent his time chiefly in tournaments, balls, concerts, and other expensive amusements. We are told that he was so extravagant in his pleasures, that, in a very short time, he entirely dissipated 1,800,000 l. which his father had hoarded. This will seem less wonderful, when the reader is informed, that gaming was one of his favourite diversions. Nevertheless he was not so totally absorbed in pleasure, but he found leisure to sacrifice to the resentment of the people two of his father's ministers, Empson and Dudley. A house in London, which had belonged to the former of these, was in 1510 given to Thomas Wolsey, who was now the king's almoner, and who from this period began to insinuate himself into Henry's favour. In 1513, he became prime minister, and from that moment governed the king and kingdom with absolute power. In this year Henry declared war against France, gained the battle of Spurs, and took the towns of Terouenne and Tournay; but before he embarked his troops, he beheaded the earl of Suffolk, who had been long confined in the tower. In 1521, he sacrificed the duke of Buckingham to the resentment of his prime minister Wolsey, and the same year obtained from the Pope the title of *Defender of the Faith*.

Henry, having been 18 years married, grew tired of his wife, and in the year 1527 resolved to obtain a divorce; but after many fruitless solicitations, finding it impossible to persuade the Pope to annul his marriage with Catharine, he espoused Ann Bullen in the year 1531. During this interval his favourite Wolsey was disgraced, and died; Henry threw off the Papal yoke, and burnt three Protestants for heresy. In 1535, he put to death Sir Thomas More, Fisher, and others, for denying his supremacy, and suppressed all the lesser monasteries.

His most sacred majesty, having now possessed his second queen about five years, fell violently in love with lady Jane Seymour. Ann Bullen was accused of adultery with her own brother, and with three other persons: she was beheaded the 19th of May,

Henry. 1536. He married Jane Seymore the day following. In 1537, he put to death five of the noble family of Kildare, as a terror to the Irish, of whose disloyalty he had some apprehensions; and in the year following he executed the marquis of Exeter, with four other persons of distinction, for the sole crime of corresponding with cardinal Pole. In 1538 and 1539, he suppressed all the monasteries in England, and seized their revenues for his own use. The queen having died in childbed, he this year married the princess Ann of Cleves: but disliking her person, immediately determined to be divorced; and his obsequious parliament and convocation unanimously pronounced the marriage void, for reasons too ridiculous to be recited: but this was not all; Henry was so incensed with his minister and quondam favourite, Cromwell, for negotiating this match, that he revenged himself by the hand of the executioner. Yet this was not the only public murder of the year 1540. A few days after Cromwell's death, several persons were burnt for denying the king's supremacy, and other articles of heresy.

His majesty being once more at liberty to indulge himself with another wife, fixed upon Catharine Howard, niece to the duke of Norfolk. She was declared queen in August 1540; but they had been privately married some time before. Henry, it seems, was so entirely satisfied with this lady, that he daily blessed God for his present felicity; but that felicity was of short duration: he had not been married above a year, before the queen was accused of frequent prostitution, both before and since her marriage: she confessed her guilt, and was beheaded in February 1542. In July 1543, he married his sixth wife, the lady Catharine Parr, the widow of John Nevil lord Latimer, and lived to the year 1547 without committing any more flagrant enormities: but finding himself now approach towards dissolution, he made his will; and, that the last scene of his life might resemble the rest, he determined to end the tragedy with the murder of two of his best friends and most faithful subjects, the duke of Norfolk and his son the earl of Surrey. The earl was beheaded on the 19th of January; and the duke was ordered for execution on the 29th, but fortunately escaped by the king's death on the 28th. They were condemned without the shadow of a crime; but Henry's political reason for putting them to death, was his apprehension that, if they were suffered to survive him, they would counteract some of his regulations in religion, and might be troublesome to his son. Henry died on the 28th of January 1547, in the 56th year of his age, and was buried at Windsor.

As to his character, it is pretty obvious from the facts above related. Lord Herbert palliates his crimes, and exaggerates what he calls his virtues. Bishop Burnet says, "he was rather to be reckoned among the great than the good princes." He afterwards acknowledges, that "he is to be numbered among the ill princes;" but adds, "I cannot rank him with the worst." Sir Walter Raleigh, with infinitely more justice, says, "If all the pictures and patterns of a merciless prince were lost to the world, they might again be painted to the life out of the history of this king." He was indeed a merciless tyrant, a scurvy politician, a foolish bigot, a horrible assassin. See ENGLAND, n° 253—292.

Henry. HENRY of Huntingdon, an English historian, of the 12th century, was canon of Lincoln, and afterwards archdeacon of Huntingdon. He wrote, 1. A history of England, which ends with the year 1154. 2. A continuation of that of Bede. 3. Chronological tables of the kings of England. 4. A small treatise on the contempt of the world. 5. Several books of epigrams and love-verses. 6. A poem on herbs; all which are written in Latin.—His invocation of Apollo and the goddesses of Tempe, in the exordium of his poem on herbs, may not be unacceptable as a specimen of his poetry.

Vatum magne parens, herbarum Phœbe repertor,
Vosque, quibus resonant Tempe jocosæ, Deæ!
Si mihi ferta prius hedera florente paratis,
Ecce meos flores, ferte parata fero.

HENRY of Susa, in Latin *de Segusio*, a famous civilian and canonist of the 13th century, acquired such reputation by his learning, that he was called *the source and splendor of the law*. He was archbishop of Embrun about the year 1258, and cardinal bishop of Ostia in 1262. He wrote *A summary of the canon and civil law*; and *a commentary on the book of the decretals*, composed by order of Alexander IV.

HENRY the Minstrel, commonly called *Blind Harry*, an ancient Scottish author, distinguished by no particular surname, but well known as the composer of an historical poem reciting the achievements of Sir William Wallace. This poem continued for several centuries to be in great repute; but afterwards sunk into neglect, until very lately that it has been again released from its obscurity by a very neat and correct edition published at Perth under the inspection and patronage of the earl of Buchan.

It is difficult to ascertain the precise time in which this poet lived, or when he wrote his history, as the two authors who mention him speak somewhat differently. Dempster, who wrote in the beginning of the last century, says that he lived in the year 1361: but Major, who was born in the year 1446, says that he composed his book during the time of his infancy, which we must therefore suppose to have been a few years posterior to 1446; for if it had been composed that very year, the circumstance would probably have been mentioned. As little can we suppose, from Mr Dempster's words, that Henry was born in 1361; for though he says that he *lived* in that year, we must naturally imagine rather that he was then come to the years of maturity, or began to distinguish himself in the world, than that he was only born at that time. The author of the dissertation on his life, prefixed to the new edition of the poem, endeavours to reconcile matters in the following manner: "It is not indeed impossible that he might be born in or about that year (1361). In the time of Major's infancy he might be about 83 years of age. In that case, it may be supposed that it was the work of his old age to collect and put in order the detached pieces of his History of Wallace, which he had probably composed in those parts of the country where the incidents were said to have happened."

We are entirely ignorant of the family from which Henry was descended; though, from his writings, we should be led to suppose that he had received a liberal education. In them he discovers some knowledge in

Henry. divinity, classical history, and astronomy, as well as of the languages. In one place he boasts of his celibacy, which seems to indicate his having engaged himself in some of the religious orders of that age. From what Major says further of him, we may suppose his profession to have been that of a travelling bard; though it does not appear that he was skilled in music, or had no other profession than that just mentioned. His being blind from his birth, indeed, makes this not improbable; though even this circumstance is not inconsistent with the supposition of his being a religious mendicant. "The particulars (says Major) which he heard related by the vulgar, he wrote in the vulgar verse, in which he excelled. By reciting his histories before princes or great men, he gained his food and raiment, of which he was worthy." It is thus probable that he would be a frequent visitor at the Scottish court; and would be made welcome by those great families who could boast of any alliance with the hero himself, or took pleasure in hearing his exploits or those of his companions.

With regard to the authenticity of his histories, Major informs us only that "he does not believe every thing that he finds in such writings;" but from other testimonies it appears, that he consulted the very best authorities which could at that time be had. Though, according to the most early account of Henry, it appears to have been at least 56 years after the death of Wallace that Henry was born; yet he is said to have consulted with several of the descendants of those who had been the companions of that hero while he achieved his most celebrated exploits, and who were still capable of ascertaining the veracity of what he published. The principal of these were Wallace of Craigie and Liddle of that ilk; who, he says, persuaded him to omit in his history a circumstance which he ought to have inserted. Besides these, he consulted with the principal people of the kingdom; and he utterly disclaims the idea of having adhered entirely to any unwritten tradition, or having been promised any reward for what he wrote. His chief authority, according to his own account, was a Latin history of the exploits of Sir William, written partly by Mr John Blair and partly by Mr Thomas Gray, who had been the companions of the hero himself. Henry's account of these two authors is to the following purpose: "They became acquainted with Wallace when the latter was only about 16 years of age, and at that time a student at the school of Dundee; and their acquaintance with him continued till his death, which happened in his 29th year. Mr John Blair went from the schools in Scotland to Paris, where he studied some time, and received priests orders. He returned to Scotland in 1296, where he joined Wallace, who was bravely asserting the liberties of his country. Mr Thomas Gray, who was parson of Libberton, joined Wallace at the same time. They were men of great wisdom and integrity, zealous for the freedom of Scotland; and were present with Wallace, and assisting to him, in most of his military enterprises. They were also his spiritual counsellors, and administered to him godly comfort. The history written by these two clergymen was attested by William Sinclair bishop of Dunkeld, who had himself been witness to many of Wallace's actions. The bishop, if he had lived longer, was to have sent

Henry. their book to Rome, for the purpose of obtaining the sanction of the pope's authority."

The book which Henry thus appeals to as his principal authority is now lost, so that we have no opportunity of comparing it with what he has written. The character given by Dempster of Henry, however, is more favourable than that by Major. He tells us, that "he was blind from his birth; a man of singular happy genius; he was indeed another Homer. He did great honour to his native country, and raised it above what was common to it in his age. He wrote, in the vernacular verse, an elaborate and grand work, in ten books, of the deeds of William Wallace." In this account there is a mistake; for the poem contains eleven or twelve books: but Dempster, who wrote in a foreign country, and had not a printed copy of Henry's work by him when he wrote his eulogium, is excusable in a mistake of this kind.

With regard to his poetical merit, it must undoubtedly rank very far below that of Homer; whom indeed he scarcely resembles in any other respects than that he went about, as Homer is said to have done, reciting the exploits of the heroes of his country, and that he was blind. In this last circumstance, however, he was still worse than Homer; for Henry was born blind, but Homer became blind after he had been advanced in years. Hence Henry, even supposing his genius to have been equal to that of Homer, must have lain under great disadvantages; and these are very evident in his works. The descriptive parts are evidently deficient, and the allusions taken principally from the way in which nature affects those senses of which he was possessed. Thus, speaking of the month of March, he calls it *the month of right digestion*, from the supposed fermentation then begun in the earth. Of April he says that the earth is then *able*, or has obtained a power of producing its different vegetables; and of this productive power he appears to have been more sensible than of the effects which commonly strike us most sensibly. "By the working of nature (says he), the fields are again clothed, and the woods acquire their worthy weed of green. May brings along with it great celestial gladness. The heavenly hues appear upon the tender green." In another place he describes the deity of some river, whom he calls *Nymphæus*, "building his bower with oil and balm, fulfilled of sweet odour." By reason of these disadvantages, he seldom makes use of similes with which Homer abounds so much; and few miraculous interpositions are to be found in his poem, though the prophecies of Thomas Lermont, commonly called *The Rhymer*, and a prophetic dream of Wallace himself, are introduced, as well as the ghost of Fawdon, a traitor who had joined Wallace, and whom the latter in a fit of passion had killed. In other respects, the same inextinguishable thirst of blood which Homer ascribes to his hero Achilles is ascribed to Wallace, though in all probability the mind of Wallace was too much enlightened to admit of such sentiments. A vast degree of courage and personal strength are ascribed to him, by means of which the exploits of the whole army are in effect transferred to a single person. As long as he is invested with the command, the Scots are victorious and irresistible; when deprived of it, they are enslaved and undone. After struggling for some time against an inveterate
and

Henry. and powerful faction, disdaining to feign submission, he is taken by treachery, and dies a martyr to the freedom of his country. The poem, on the whole, is valuable, on account of our being able to trace, by its means, the progress which the English language had made at that time in Scotland; the manners of the Scots in that age; as the favourite dress of green which at that time was the taste of the inhabitants of Scotland, &c. With regard to the authenticity of his relations, it is impossible to suppose any other thing than that they are partly true and partly false. The general thread of the story may undoubtedly be looked upon to be genuine, though embellished with poetical fictions and exaggerations; and his constant appeals to the book already mentioned, though it is now lost, must be looked upon as a strong testimony in his favour: for we cannot suppose that at the time he lived, when we may say that the transactions which he relates were recent, he would have had the confidence to appeal to a book which had not been generally known to have an existence; and its being now lost can never be any argument against it, when we consider the difficulty there was of preserving books before the invention of printing; the confusions in which Scotland was frequently involved; and that the exploits of Wallace, who must be supposed to have been a kind of rival to the great Bruce, could not be so agreeable to the court as those of the more successful hero; and therefore the history of them might be suffered to fall into oblivion, though written in elegant Latin, while a most ridiculous poem in that language on the battle of Bannockburn has been preserved to this day.

HENRY Prince of Wales, eldest son of king James VI. of Scotland by his queen Anne sister of the king of Denmark, and one of the most accomplished princes of the age in which he lived, was born on the 19th of February 1594. The birth of the prince was announced by embassies to many foreign powers, with invitations to be present at the ceremony of his baptism, which was thus delayed for a considerable time. Mr Peter Young, who, along with the celebrated George Buchanan, had been preceptor to his majesty, was sent to the courts of Denmark, Brunswick, and Mecklenburg, the duke of Mecklenburg being great-grandfather to the prince by the mother's side; the laird of East Weems to France and England; and Sir Robert Keith, and captain Murray provost of St Andrew's, to the States General, who at that time were struggling against the Spanish tyranny, and not yet declared a free state. All these ambassadors were cordially received, and others appointed in return except by the courts of France and England. Henry IV. at that time king of France, though the Scots ambassador had formerly been one of his own servants, neither made any present, nor appointed an ambassador. Queen Elizabeth had designed to act in the same manner till she heard of the behaviour of Henry; after which she honoured James by appointing an ambassador of very high rank, Robert earl of Suffex. This ambassador, however, was so long of making his appearance, that the queen imagined the ceremony would be over before his arrival; for which reason she sent a message to the earl, commanding him in that case not to enter Scotland nor deliver her present. But James had been more obsequious; and not only delayed the ceremony

till the English ambassador arrived, but distinguished him from the rest by having a canopy carried over his head at the procession, supported by the lairds of Cessford, Buccleugh, Duddope, and Traquair. The ceremony was performed with great magnificence; after which the ambassadors presented their gifts. That from the United States was the most valuable. It consisted of two gold cups worth 12,400 crowns, with a box of the same metal, weighing in all about 400 ounces, containing besides the grant of a pension of 5000 florins annually to the prince for life. The English ambassador gave a cupboard of plate curiously wrought, and valued at 3000l. sterling; and the Danish ambassador two gold chains, one for the queen and another for the prince. The baptism was celebrated on the 6th of September 1594, and the child named Frederick-Henry and Henry-Frederick.

The young prince was now committed to the care of the earl of Mar, who was assisted in this important charge by Annabella countess-dowager of Mar, daughter of William Murray of Tullibardine, and paternal ancestor of the present duke of Athol. This lady was remarkable for the severity of her temper, so that the prince met with little indulgence while under her tuition; notwithstanding which, he showed great affection for his governess all the time she had the care of him. Next year, however (1595), the queen engaged the chancellor, lord Thirlestane, in a scheme to get the prince into her own power; but the king having found means to dissuade her majesty from the attempt, showed afterwards such marks of displeasure to the chancellor, that the latter fell into a languishing disorder and died of grief.

In his sixth year prince Henry was committed to the care of Mr Adam Newton a Scotsman, eminently skilled in most branches of literature, but particularly distinguished for his knowledge of the Latin language. Under his tutorage the prince soon made great progress in that language, as well as in other branches of knowledge; insomuch that before he had completed his sixth year his father wrote for his use the treatise intitled *Basilikon Doron*, thought to be the best of all his works.

In his seventh year, prince Henry began his correspondence with foreign powers. His first letter was to the States of Holland; in which he expressed his regard and gratitude for the good opinion they had conceived of him, and of which he had been informed by several persons who had visited that country; concluding with a request that they would make use of his interest with his father in whatever he could serve them, promising also his service in every other respect in which he could be useful, until he should be able to give farther instances of his good-will and affection.

At this early period the prince began to add to his literary accomplishments some of the more martial kind, such as riding, the exercise of the bow, pike, &c. as well as the use of fire-arms; and indeed such was the attachment he showed throughout his whole lifetime to military exercises, that had he attained the years of maturity, there can scarce be a doubt that he would have distinguished himself in a most eminent manner. In all his exercises he made surprising progress; and not only in those of the military kind, but in singing, dancing, &c. On his ninth birth-day he sent a letter in Latin to the king, informing him that he had read

Henry.

over Terence's Hecyra, the third book of Phædrus's Fables, and two books of Cicero's Epistles; and that now he thought himself capable of performing something in the commendatory kind of epistles. His accomplishments were soon spoken of in foreign countries; and these, along with the general suspicion that James favoured the Catholic party, probably induced pope Clement VIII. to make an attempt to get him into his hands. With this view he proposed, that if James would entrust him with the education of the young prince, he would advance such sums of money as would effectually establish him on the throne of England. This happened a little before the death of Elizabeth; but James, notwithstanding his ambition to possess the crown of England, of which he was not yet altogether certain, withstood the temptation. He alleged, that it would be unnatural for him, as a father, to allow his son to be brought up in the belief of a doctrine which he himself did not believe: and even though he should act in his private capacity in such an unnatural manner, he could not answer for it to the nation, he being heir-apparent to the crown, and the kingdom at large much interested in whatever concerned him. On the death of the queen of England, James was obliged to leave Scotland in such haste, that he had no time to take a personal leave of his son, and therefore did so by letter, which was answered by the prince in Latin. The queen, however, who had been desired to follow the king to London in three weeks, but to leave the prince in Scotland, thought proper to make another attempt to get her son into her own power. With this view she took a journey to Stirling, where the prince resided, but was opposed in her designs by the friends of the house of Mar; and this affected her so much, that she miscarried of a child of which she was then pregnant. The king, hearing of this misfortune, ordered the prince to be delivered to his mother; but refused to inflict any punishment on the earl of Mar, which the queen insisted upon, that nobleman having been with the king at London, and entirely innocent of the whole affair. Instead of punishing him, therefore, he caused him to be acquitted by an act of the public council at Stirling; invested him with the order of the garter; made him a grant of several abbey and other church lands; and raised him to the post of lord high treasurer after the disgrace of the earl of Somerset; in which employment he continued till he could no longer perform the duties of his office through age and infirmity.

In the month of July this year (1603) prince Henry was invested with the order of the garter; after which he was presented to the queen in his robes, and greatly commended by all who saw him on account of his majestic carriage and religious behaviour at the altar, as well as the quickness of his understanding and ready answers. Being obliged to leave London on account of the plague, he retired to Otelands, a royal palace near Weybridge in Surrey, where a separate household was appointed for him and his sister Elizabeth. The appointment consisted at first of 70 servants, of whom 22 were to be above stairs and 48 below. In some weeks the number was augmented to 104, of whom 51 were above stairs and 53 below; but before the end of the year they were augmented to 141, of whom 56 were above stairs and 85 below.

From Otelands he removed the same year to Nonfuch in Surrey, and from thence to Hampton Court, where he resided till Michaelmas 1604; after which he returned to his house at Otelands, his servants having all this time been kept on board-wages.

In the tenth year of his age, Henry began to show a wonderful desire of becoming master of all those accomplishments which are necessary to constitute a great prince. Without desisting from his attention to polite literature, he applied himself in the most assiduous manner to the knowledge of naval and military affairs. To give him the first rudiments of the former, a small vessel was constructed 28 feet long and 12 broad, curiously painted and carved; on board of which he embarked with several of the principal nobility, and sailed down as far as Paul's Wharf, where, with the usual ceremonies, he baptized it by the name of the *Disdain*. Mr Pett the builder of this ship was recommended to the prince by the high admiral in such strong terms, that his highness took him immediately into his service, and continued his favour to him as long as he lived.

Prince Henry now began to show himself equally a patron of military men and of learning. His martial disposition induced him to take notice of Colonel Edmondson, a brave Scots officer in the Dutch service, who had raised himself solely by his merit. To him he applied for a suit of armour to be sent over from Holland: but though the Colonel executed his commission, he reaped no benefit from his highness's favour, dying in a short time after the armour was purchased, before he had any opportunity of sending it over. In matters of literature the prince appears to have been a very good judge. He patronised divines, and appears to have been naturally of a religious turn of mind. His attachment to the Protestant religion appears to have been excessive; as it never was in the power of the queen, who favoured the catholic party, to make the least impression upon him. Her machinations for this purpose were discovered by the French ambassador; who, in a letter dated June 7th 1604, informed his master of them, and that the Spaniards were in hopes of being able by her means to alter the religion in England, as well as to prejudice the prince against France, which the queen said she hoped that her son would one day be able to conquer like another Henry V. By another letter, of date 22d October the same year, the ambassador, after taking notice of the queen's immoderate ambition, adds, that she used all her efforts to corrupt the mind of the prince, by flattering his passions, diverting him from his studies, and representing to him, out of contempt to his father, that learning was inconsistent with the character of a great general and conqueror; proposing at the same time a marriage with the infanta of Spain. Notwithstanding these remonstrances, however, the prince continued to behave as usual, and to patronise the learned no less than before. He presented John Johnston, one of the king's professors at St Andrew's, with a diamond, for having dedicated to him an Historical Description of the kings of Scotland from the foundation of the monarchy to that time; after which the professor added a *carmen encomiasticum*, which was transmitted to his highness in November 1605. Many other authors also sought and obtained his countenance. In 1606 Mr John Bond ushered his edition of Horace into the world

Henry.

Henry. world with a polite dedication to the prince, whom he highly compliments on account of the progress he had made in learning. In 1609 a book was sent over to him from France by Sir George Carew, the British ambassador there, tending to disprove the doctrine of the Catholics concerning the church of Rome being the first of the Christian churches. The same year the learned Thomas Lydyat published his *Emendatio Temporum*, which appeared under the patronage of the prince; and with this performance his highness was so well pleased, that he took the author into his family to read to him, and made him his chronographer and cosmographer. Paul Buys or Busius also sent him a letter with a dedication of the second part of his *Pandects*; in which he bestows upon him the highest compliments on the great expectations which were formed of him, and of the hopes entertained by the reformed Christian churches that he would prove a powerful support to their cause, and antagonist to the errors of Rome. In 1611 Dr Tooker, in his dedication of an Answer to Becanus a Jesuit, who had written against a piece done by his majesty himself, styles his highness "the Mæcenas of all the learned." Another treatise against the same Becanus was also printed this year, and dedicated to the prince.

Many other authors, whom our limits will not allow us to take notice of, were fond of dedicating their performances to his highness; nor was his correspondence less extensive than his erudition. We have already taken notice of his having written his first public letter to the states of Holland. He was congratulated by the elector palatine, afterwards married to the princess Elizabeth, on the discovery of the gunpowder-plot. On the same occasion also Lord Spencer wrote him a letter, accompanying it with the present of a sword and target; "instruments (says he) fit to be about you in those treacherous times; from the which, I trust, God will ever protect your most royal father, &c." Previous to this he had corresponded in Latin with the doge of Venice, the landgrave of Hesse, and the king of Denmark; in French with the duke of Savoy, and in Latin with the duke of Brunswic and Uladissaus king of Poland; besides a number of other eminent persons too tedious to enumerate.

The great accomplishments of Henry soon caused him to be taken notice of by the most eminent princes in Europe. In 1606 Henry IV. of France ordered his ambassador to pay him special regard on all occasions. He desired him likewise to salute the prince in the name of the dauphin, afterwards Louis XIII. and to inform him of the regard the latter had for him. A message was also sent by the same ambassador to M. de St Anthoine, appointed to be riding-master to his highness, enjoining him to do his duty in that office; and assuring him that his majesty would be as much pleased with it as if the service had been done to himself. To these messages the prince returned very proper answers; and afterwards performed his exercise in the riding-school before the ambassador himself, that the latter might send an account thereof to his master. On this occasion he mounted two horses, and acquitted himself so well that the ambassador, in a letter to M. de Villeroy, the French secretary, gave him the character of "a prince who promised very much, and whose friendship could not but be one day of advantage." Having then

set forth the propriety of cultivating a good understanding with him, he tells the secretary, that the dauphin might make a return for some dogs which the prince had sent him, by a suit of armour well gilt and enamelled, together with pistols and a sword of the same kind; also two horses, one of them a barb.— This year also the prince waited on his uncle the king of Denmark, who had come to England on a visit to King James; and this monarch was so much pleased with his company, that he presented him at parting with his vice-admiral and best fighting ship, valued at no less than 2500l. also with a rapier and hanger, valued at 2000 marks. The states of Holland were equally ready to show their attachment. On the 25th of August this year they sent a letter to the prince in French, accompanied with the present of a set of table-linen, which they thought, as being the produce of their own country, would be agreeable to him; and they requested his love and favour towards their state: in return for which they promised to be always ready to show their regard for him, and to do him all possible service; as the ambassador himself was ordered more particularly to declare. About this time the prince himself wrote a letter to Henry IV. acknowledging the kindness which his majesty had shown him for several years, and confirmed of late by the latter offering him under his own royal hand his friendship and that of the dauphin.

While James was this year employed in hunting, the French ambassador, who had been obliged to quit London on account of the plague, took frequent opportunities of waiting upon his highness, as did also the Spanish ambassador, whose ostensible reason was to inform him about some horses which were to be sent him from Spain. The prince's partiality towards France, however, was so evident, that the French ambassador, in a letter dated 31st October 1606, mentions, that "as far as he could discover, his highness's inclination was entirely towards France, and that it would be wrong to neglect a prince who promised such great things. None of his pleasures (continued he) favour the least of a child. He is a particular lover of horses and whatever belongs to them: but is not fond of hunting; and when he goes to it, it is rather for the pleasure of galloping than that which the dogs give him. He plays willingly enough at tennis, and another Scottish diversion very like mall; but this always with persons elder than himself, as if he despised those of his own age. He studies two hours a-day, and employs the rest of his time in tossing the pike, or leaping, or shooting with the bow, or throwing the bar, or vaulting, or some other exercise of the kind, and he is never idle. He shows himself likewise very good-natured to his dependents, supports their interests against any persons whatever, and pushes whatever he undertakes for them or others with such zeal as gives success to it. For, besides his exerting his whole strength to compass what he desires, he is already feared by those who have the management of affairs, and especially by the earl of Salisbury, who appears to be greatly apprehensive of the prince's ascendant; as the prince, on the other hand, shows little esteem for his lordship." In this letter the ambassador further goes on to remark, that some of the prince's attendants had formerly been made to expect pensions from France; and he.

Henry.

Henry. he was of opinion that they ought to be gratified on account of the interest they had with the prince. He adds, that the queen had less affection for Prince Henry than for his brother the duke of York, afterwards Charles I.; which the prince seemed to have discovered, and sometimes used expressions to that purpose: that the king also seemed to be jealous of his son's accomplishments, and to be displeased with the quick progress he made.

In 1607 the prince received the arms and armour which Henry IV. sent him as a present; and these being accompanied with a letter, the prince returned an answer by a Mr Douglas, who was introduced to the king of France by the ambassador Sir George Carew. His majesty, contrary to custom, opened the prince's letter immediately; and was so much surprised at the beauty of the character, that he could not be satisfied that it was the prince's hand until he compared the signature with the rest of the writing. In his letter to the British court on this occasion, the ambassador sets forth in strong terms the affection expressed by the French monarch for the prince; "accounting of him as of his own son, as he hoped that his good brother of great Britain would do the like of the dauphin." The French ambassador also gave a character of his highness similar to that already mentioned; remarking, that the prince had great accomplishments and courage; would soon make himself talked of, and possibly give jealousy to his father, and apprehensions to those who had the greatest ascendant at court." With regard to the pensions to his attendants, he was at first of opinion that they ought to be granted; but afterwards altered his mind, perceiving that there was little probability of the prince being influenced by any of his attendants, as he was much more inclined to be guided by his own judgment than by the suggestions of others. — In the month of July this year the Dutch ambassadors came recommended to Prince Henry by the States, who wrote to him that they had ordered their ambassadors to kiss his highness's hands on their part, and desired him to continue his friendship to their republic, and to allow their ambassadors a favourable audience, and the same credit as to themselves.

All this attention paid him by foreign powers, all his attention to his own improvements in learning and the military art, and all the temptations which we cannot but suppose a youth in his exalted station to have been exposed to, seem never to have shaken the mind of this magnanimous prince in the least, or to have at any time made him deviate from the strict line of propriety. We have already mentioned his attachment to the Protestant religion; and this appears not to have been grounded upon any prejudice or opinion inculcated upon his infant mind by those who had the care of him, but from a thorough conviction of the truth of the principles which he professed. On the discovery of the gunpowder-plot, he was so impressed with gratitude towards the Supreme Being, that he never afterwards omitted being present at the sermon preached on the occasion. In his 14th year the prince showed himself capable of distinguishing the merit of religious discourses, and paid particular regard to such divines as were most remarkable for their learning and abilities. Among others, he honoured with his attention the learned and eloquent Mr Joseph Hall, then rector

of Halstead in Suffolk, afterwards dean of Worcester, and successively bishop of Exeter and Norwich. His highness was so much pleased with a book of Meditations published by that divine, that he pressed him to preach before him; and having heard two of his sermons, he engaged him as one of his chaplains; inviting him afterwards to stay constantly at his court, while the other chaplains waited only in their turns; promising, moreover, to obtain from the king such preferments as should fully satisfy him. Mr Hall, however, from a reluctance to leave his new patron Lord Denny afterwards earl of Norwich, did not accept of these honourable and advantageous proposals.

In his family the prince took the utmost care to preserve decency and regularity. He ordered boxes to be kept at his three houses of St James's, Richmond, and Non-such, for the money required of those who were heard to swear; the fines levied on such offenders being given to the poor. He had, indeed, a particular aversion to the vice of swearing and profanation of the name of God. When at play, he never was heard to do so; and on being asked why he did not swear at play as well as others? he answered, that he knew no game worthy of an oath. The same answer he is said to have given at a hunting-match. The stag, almost quite spent, crossed a road where a butcher was passing with his dog. The stag was instantly killed by the dog; at which the huntsmen were greatly offended, and endeavoured to irritate the prince against the butcher: but his highness answered coolly, "What if the butcher's dog killed the stag, what could the butcher help it? They replied, that if his father had been so served, he would have sworn so that no man could have endured. "Away," cried the prince, "all the pleasure in the world is not worth an oath."

The regard which Prince Henry had for religion was manifest from his attachment to those who behaved themselves in a religious and virtuous manner. Among these was Sir John Harrington, whose father had been knighted by queen Elizabeth, and created by King James a baron of England in 1603 by the title of Lord Harrington of Exton in Rutland. He was entrusted with the care of the Princess Elizabeth after her marriage with the elector palatine, whom he attended to Heydelberg in 1613, and died at Worms on the 24th of August following. His son, who in the year 1604 had been created knight of the Bath, was as soon as he came to the years of discretion remarkable for his piety; insomuch that he is said to have kept an exact diary of his life, and to have examined himself every week as to the progress he had made in piety and virtue, and what faults he had committed during that time. He was affable and courteous to all, and remarkable for his humanity to those in distress; all which good qualities so endeared him to the prince, that he entered into as strict a friendship with him as the disproportion between their stations would allow. There are still several letters extant which passed between them, chiefly upon classical subjects. This worthy and accomplished nobleman died in February 1614.

In his friendship Prince Henry appears to have been very sincere, and inviolably attached to those whom he once patronised. He had a great regard for the unfortunate Lady Arabella Stewart, sister of Henry Lord Darnley,

Henry. Darnley, the king's father; and there is still extant a letter from this lady to the prince in return for some kindness he had bestowed on a kinsman of hers at her recommendation. He expressed much compassion for her misfortunes; she having excited the king's jealousy on account of her marriage with Mr William Seymour, afterwards earl and marquis of Hertford, and restored in 1660 to the dukedom of Somerset. But on her attempting to escape from the house in Highgate where she was confined, and to go abroad with her husband, his highness expressed some resentment against her; though in all probability his apprehensions, as well as those of the king, were ill-founded.

As early as the year 1605, the prince, though then only in his 11th year, manifested his gratitude and attachment to those who had served him, in the instance of his tutor Mr Newton already mentioned. That gentleman had been promised by his majesty the deanery of Durham upon the demise of the archbishop of York. On this promise Mr Newton had relied for two years; and as soon as the prelate died, his highness took care to put the king in mind of his promise; in consequence of which, Mr Newton was installed in his office on the 27th of September 1606.

Mr Pett, the gentleman who first instructed the prince in naval affairs, having been involved with many others in an inquiry concerning their conduct in their respective employments in the royal navy, the prince showed a laudable desire of protecting their innocence. The inquiry was set on foot by the earl of Northampton, lord privy seal and warden of the cinque ports, who had received a commission from the king for the purpose. It was carried on by his agents, however, with such violence and malice, as not only occasioned great trouble and expence to the parties concerned, but almost ruined the navy, besides augmenting his majesty's expences much more than formerly. Mr Pett's trial began on the 28th of April 1609; at which time the reports being very favourable to him, the king determined to examine into the state of the matter himself. For this purpose he went to Woolwich on the 8th of May, attended by the prince; and appointed Sir Thomas Chaloner, his highness's governor, and Mr Henry Briggs then professor of geometry in Gresham college, to decide the controversy which was then agitated about the proportion of the ships. The measurers declared in favour of Mr Pett; on which the prince exclaimed, "Where be now those perjured fellows, that dare thus to abuse his majesty with false informations? Do they not worthily deserve hanging?" During the whole time he stood near Mr Pett to encourage him; and when the king declared himself satisfied of his innocence, the prince took him up from his knees, expressing his own joy for the satisfaction which his father had received that day; protesting that he would not only countenance Mr Pett for the future, but provide for him and his family as long as he lived.

The courage, intrepid disposition, and martial turn of this prince, were manifest from his infancy. It is related of Alexander the Great, that at a very early period of his life he showed more skill than all his father's grooms in the breaking of his favourite horse Bucephalus. An anecdote somewhat similar is re-

corded of Prince Henry. He was hardly ten years of age, when he mounted a very high-spirited horse, in spite of the remonstrances of his attendants; spurred the animal to a full gallop; and having thoroughly wearied him, brought him back at a gentle pace, asking his servants at his return, "How long shall I continue in your opinion to be a child?" From the very first time that he embarked on board the small vessel formerly mentioned, he continued to pay the utmost attention to naval affairs. In August 1607, he visited the royal navy at Woolwich, where he was received by Mr Pett, and conducted aboard the Royal Anne, where he had 31 large pieces of ordnance ready to be fired. This was done unexpectedly as soon as the prince reached the poop; at which he expressed great satisfaction. After visiting the dock-yard, and surveying what was done of a ship then building for himself, he went ashore, and having partaken of an entertainment prepared for him by Mr Pett, he was by him conducted to the mount, where the ordnance were again charged and ready to be placed for firing. The prince insisted upon an immediate discharge, but suffered himself to be persuaded against it by Mr Pett's representation of the danger of firing so many ordnance loaded with shot while his highness stood close by: on a signal given by him, however, by holding up his handkerchief, after he had removed to a proper distance with his barge, the ordnance were discharged as he had desired. In his 16th year he paid several visits to Woolwich, in order to see the above mentioned ship which was building for himself. When finished, it was the largest that had ever been seen in England: the keel being 114 feet in length, and the cross-beam 44 feet; carrying 64 pieces of great ordnance; the burden about 1400 ton; and the whole curiously ornamented with carving and gilding. His highness having received this ship in a present from his majesty, went to see it launched on the 24th of September 1609. The narrowness of the dock, however, having prevented its being done at that time, the prince, who staid behind the rest of the company in order to prepare for the ceremony next morning, returned by three o'clock through a storm of rain, thunder, and lightning; and standing on the poop while the ship was launched, gave it the name of the *Prince Royal*.

In 1611 his highness made a private visit to Chatham, where he first went on board the *Prince Royal*, and afterwards from ship to ship; informing himself particularly of every thing of moment relating to the state of all the different ships, and even pinnaces lying there at that time. Next day he went by water up to Stroud; where, contrary to all the remonstrances of his attendants, he caused the ordnance to be shot over his barge. From Stroud he went to Gravesend, where the magistrates received him with a discharge of all their small-arms and the ordnance of the block-houses.

About the middle of January 1612, Prince Henry ordered all his majesty's master-shipwrights and builders to attend him to consider of a proposition concerning the building of ships in Ireland made by a Mr Burrel. Some of his propositions were, that he should build any ship from 100 to 600 ton, with two decks and an half, at the rate of five pounds per ton; that he would build any ship from 600 to 1000 ton

Henry.

Henry.

with three whole decks, at the rate of seven pounds per ton; that he should build a ship of 600 ton within a certain time, &c. Mr Pett was employed to see that this contract was fulfilled on the part of Mr Burrel. Among the prince's papers, a list of the royal navy was found after his death, with an account of all the expences of fitting out, manning, &c. which must now be accounted a valuable addition to the naval history of those times. His passion for naval affairs naturally led him to a desire of making geographical discoveries; of which, however, only two instances have reached our times. One was in 1607, when he received from Mr Tindal his gunner, who had been employed by the Virginia company, a draught of James's river in that country, with a letter dated 22d June the same year. In this letter Mr Tindal remarks, that his fellow-adventurers had discovered that river; and that no Christian had ever been there before; that they were safely arrived and settled; that they found the country very fruitful; and that they had taken a real and public possession in the name and to the use of the king his highness's father. The other instance was in the year 1612, the same in which he died, when he employed Mr Thomas Button, an eminent mariner, to go in quest of a north-west passage. Mr Button accordingly set sail with two ships named the *Resolution* and *Discovery*; the same designations with those in which the late Captain Cook made his last voyage. Both of them were victualled for 18 months; but wintering in these northern regions, they did not return till after the prince's decease, so that Captain Button was never sent on another voyage: nevertheless, he returned fully convinced of the existence of such a passage; and even told the celebrated professor Briggs of Gresham college, that he had convinced the king of his opinion.

The martial disposition of the prince, which was conspicuous on all occasions, eminently displayed itself on the occasion of his being invested in the principality of Wales and duchy of Cornwall, which took place in the year 1610. Previous to this ceremony, he, under the name and character of *Meliades* lord of the isles, caused a challenge to be given, in the romantic style of those times, to all the knights in Great Britain. The challenge, according to custom, was accepted; and on the appointed day, the prince, assisted only by the duke of Lenox, the earls of Arundel and Southampton, Lord Hay, Sir Thomas Somerset, and Sir Richard Preston who instructed his highness in arms, maintained the combat against 56 earls, barons, knights, and esquires. Prince Henry himself gave and received 32 pushes of the pike, and about 360 strokes of swords, performing his part very gracefully, and to the admiration of all who saw him, he being not yet 16 years of age. Prizes were bestowed upon the earl of Montgomery, Mr Thomas Darry, and Sir Robert Gordon, for their behaviour at this combat. The ceremony of installation was performed on the 4th of June 1610, at which time every kind of magnificence was displayed that could be devised. Among other pageants used on this occasion was that of Neptune riding on a dolphin and making speeches to the prince; also of a sea-goddess upon a whale. After the ceremony the prince took his place on the left hand of his majesty; sitting there in his royal robes,

with the crown on his head, the rod in one hand, and in the other the patent creating him Prince of Wales and duke of Cornwall. A public act was then read, testifying that he had been declared prince of Great Britain and Wales. He was afterwards served at table with a magnificence not unworthy of royalty itself; the whole concluding with a grand masquerade and tournament.

In one instance, the extreme desire which Prince Henry had of being instructed in military affairs, carried him beyond those bounds which European nations have prescribed to one another. In 1607 the prince de Joinville, brother to the duke of Guise, came to England, having been obliged to leave France in consequence of his having made love to the countess de Moret the king's mistress. After having been for a few weeks magnificently entertained at court, he departed for France in the beginning of June. The prince took an opportunity of sending to Calais in the train of the prince an engineer in his own service, who took the opportunity of examining all the fortifications of the town, particularly those of the Rix-banc. This was discovered by the French ambassador, who immediately gave notice of it to court, but excused the prince, as supposing that what he had done was more out of curiosity than any thing else; and the court seemed to be of the same opinion, as no notice was ever taken of the affair, nor was the friendship betwixt King Henry and the prince in the smallest degree interrupted. The martial disposition of his highness was greatly encouraged by some people in the military line, who put into his hands a paper intitled "Propositions for War and Peace." Notwithstanding this title, however, the aim of the author was evidently to promote war rather than peace; and for this the following arguments were used. 1. Necessity; for the preservation of our own peace, the venting of factious spirits, and instructing the people in arms. 2. The benefits to be derived from the spoils of the enemy, an augmentation of revenue from the conquered countries, &c. This was answered by Sir Robert Cotton in the following manner. 1. That our wisest princes had always been inclined to peace. 2. That foreign expeditions were the causes of invasions from abroad and rebellions at home, endless taxations, vassalage, and danger to the state from the extent of territory, &c. It does not appear, however, that the prince was at all moved by these pacific arguments: on the contrary, his favourite diversions were tilting, charging on horseback with pistols, &c. He delighted in conversing with people of skill and experience in war concerning every part of their profession; caused new pieces of ordnance to be made, with which he learned to shoot at a mark; and was so careful to furnish himself with a breed of good horses, that no prince in Europe could boast of a superiority in this respect. He was solicited by Sir Edward Conway to direct his attention to the affairs of the continent, where Sigismund III. of Poland threatened, in conjunction with the king of Denmark, to attack Gustavus Adolphus the young king of Sweden; but the death of the prince, which happened this year, prevented all interference of this kind.

To his other virtues Prince Henry added those of frugality without avarice, and generosity without extravagance.

Henry.

Henry. extravagance. As early as the year 1605 he began to show an attention to his interest as duke of Cornwall, and to take proper measures for securing his revenues there. In 1610 he settled and appointed the officers of his household, making his choices with the greatest prudence, and giving orders for the management and regulation of his affairs with all the wisdom and gravity of an old counsellor. Some lands were now allotted to him for his revenues; and instead of diminishing his income during the short time he was in possession of them, they were found at his death to be some thousands of pounds better than when he obtained them. At this time he showed much reluctance to gratify any of his servants except by promises, as not thinking himself yet authorised to give any thing away: but a short time before his death, he conferred pensions on some of them; and there is no reason to doubt, that had his life been prolonged he would have rewarded them all according to their merit.

Though Prince Henry never interfered much in public business, yet in any little transactions he had of this kind, he always displayed great firmness and resolution, as well as absolute propriety of conduct. In a letter from Sir Alexander Seton, earl of Dunfermling, he is commended for the firmness and resolution with which he repelled the calumnies of some who "had rashly, and with the highest intemperance of tongue, endeavoured to wound the Scottish nation." By this he alluded to some very gross and scurrilous invectives thrown out against the whole body of the Scots by Sir Christopher Pigot, in a debate in the house of commons, on an union between the two kingdoms. This gentleman declared his astonishment at the proposal of uniting a good and fertile country to one poor, barren, and in a manner disgraced by nature; and for associating rich, frank, and honest men, with such as were beggars, proud, and generally traitors and rebels to their kings; with many other shameful expressions of the same kind. His majesty was highly offended with the whole council; and Sir Christopher, after being obliged in parliament to retract his words, was expelled the house and imprisoned; in consequence of which, the king was addressed by the states of Scotland, who thanked him for the zeal he had manifested for the honour of the country. In another instance, where the prince wished Mr Fullerton, a Scotsman, to supersede Sir Robert Car, one of the attendants of his brother the duke of York, contrary to the inclination of the king and earl of Salisbury, his highness carried his point by persuading Sir Robert of himself to give up the place in question.

Under this year, 1611, the elegant Latin historian of Great Britain from 1572 to 1628, Robert Johnston, places a story, which, though unsupported by any authority but his own, and improbable in itself, must not be omitted here. The prince, according to this writer, requested the king that he might be appointed to preside in the council. This demand was seconded by the king's favourite Car, Viscount Rochester, who urged his majesty to lay his son's petition before the council. But the earl of Salisbury, jealous of the growing power of Rochester, and a thorough master of artifice and dissimulation, used all his efforts to defeat whatever measures were proposed by his rival; and being asked soon after his opinion upon this point,

whether it was for the public interest that the prince should preside in the council? answered, that he thought it dangerous to divide the government, and to invest the son with the authority of the father. Many others of the privy council having delivered their opinions on the same question, that of the earl of Salisbury was adopted by the majority. But his lordship soon took an opportunity, in a secret conference with the prince, to lament his own situation, and to persuade his highness that Lord Rochester had the only influence in the palace, and privately counteracted all his designs. The prince, on his part, resented the denial of his request, and his exclusion from public business. It was not long before Lord Rochester discovered the earl of Salisbury's practice against him with the prince; to whom he therefore went to clear himself. But his highness turned from him with great indignation, and would not hear his justification. The queen likewise, highly displeased with the viscount, refused to see him, and sought all means of lessening his power. This forwardness imputed to the prince by the historian, in endeavouring to intrude himself into the management of public affairs, is not (as Dr Birch remarks) at all suitable to the character of his highness, or to any other accounts which we have of him; nor ought it to be believed upon the credit of a writer who cites no authority for it, nor indeed for scarce any other assertions in his history, how extraordinary soever they appear to be, and who frequently ventures to enlarge upon subjects which it was impossible for him to have known. However, it is not much to be doubted, that the prince had no great esteem for Lord Rochester, whose rise to the power of a favourite and a minister he so much disliked, if we may believe a satirical writer of *Memoirs**, that he was reported either to have struck his lordship on the back with a racket, or very hardly forborne it. And another historian, not much less satirical, Arthur Wilson†, mentions the bickerings betwixt the prince and the viscount; and that Sir James Elphinston observing his highness one day to be discontented with the viscount, offered to kill him; for which the prince reproved him, and said that if there were cause he would do it himself. But to wave such very suspicious authorities, it will be sufficient, in order to judge of his highness's opinion of the viscount, and his administration at the very height of it, to hear what himself says in a letter to Sir Thomas Edmondes of the 10th of September 1612: "As matters go now here, I will deal in no businesses of importance for some respects."

It is not to be supposed but that the marriage of a prince so accomplished and so much admired would engage the attention of the public. This was indeed the case. The queen, who favoured the interest of Spain, proposed a match with the infanta, and the king of Spain himself seemed to be inclined to the match. In 1611 a proposal was made for a double marriage betwixt the prince of Wales and the eldest daughter of the house of Savoy, and between the prince of Savoy and the Lady Elizabeth; but these overtures were very coolly received, being generally disagreeable to the nation. Sir Walter Raleigh, at that time prisoner in the Tower, wrote two excellent treatises against these matches; in one of which he styles the prince *The most excellent and hopeful*, as he does also in the in-

Henry.

* Francis Osborne's *Traditional Memoirs on King James*, sect. 38.

Henry. Introduction to his Observations on the royal navy and sea-service. About the year 1612, his marriage became an object of general attention. In this affair the king seems to have inclined to match his son with the princess who promised to bring the largest dowry; the nation at large to have been influenced by motives of religion; and the prince himself to have remained entirely passive, and to have been willing to bestow his person with the most perfect indifference on whatsoever princess should be chosen for him. This appears from a letter to the king dated 5th October 1612, in which he considers the match with the second princess of France as in a manner concluded. Proposals had indeed been made of sending her over to England for her education, she being only nine years of age at that time; but Villeroy the French minister was of opinion, that this ought to be delayed for a year longer. The reasons assigned by the prince for wishing her coming to England at that time were merely political: 1. Because the French court, by having the princess in their power, might alter her mind as they pleased; 2. That there would thus be a greater likelihood of converting her to the Protestant religion; and, 3. That his majesty's credit would be better preserved when both daughters (the eldest being promised to the prince of Spain) should be delivered at the same time, though the conclusion of the one marriage might be much later than of the other. With regard to the exercise of her religion, the prince expressed himself rather in severe terms, wishing his majesty only to allow her to use it in "her most private and secret chamber." He then argues with the most philosophic indifference of the propriety of a match with the French princess rather than with one of the house of Savoy; concluding at last in the following words; "If I have incurred in the same error that I did last by the indifference of my opinion, I humbly crave pardon of your majesty, holding it fitter for your majesty to resolve what course is most convenient to be taken by the rules of the state, than for me who am so little acquainted with subjects of that nature: and besides, your majesty may think, that my part to play, which is to be in love with any of them, is not yet at hand." On the whole, it appeared, that there never was any real design in the king or prince to bring this matter to a conclusion; and that the proposal had been made only with a view to break off the match of the eldest daughter with the prince of Spain, which could not now be done.

Prince Henry, notwithstanding his indifference in matrimonial matters, applied himself with the utmost assiduity to his former employments and exercises, the continual fatigue of which was thought to impair his health. In the 19th year of his age his constitution seemed to undergo a remarkable change: he began to appear pale and thin, and to be more retired and serious than usual. He complained now and then of a giddiness and heavy pain in his forehead, which obliged him to stroke up his brow before he put on his hat: he frequently bled at the nose, which gave great relief, though the discharge stopped some time before his death. These forebodings of a dangerous malady were totally neglected both by himself and his attendants, even after he began to be seized at intervals with fainting fits. Notwithstanding these alarming symp-

Henry. toms, he continued his usual employments. On the arrival of Count de Nassau in England, he waited upon him as though nothing had been the matter; and when the subject of the princess Elizabeth's marriage came to be canvassed, he interested himself deeply in the affair, and never desisted till the match with the elector palatine was concluded. In the beginning of June 1612, the prince went to Richmond, where he continued till the progress; and notwithstanding the complaints above mentioned, he now took the opportunity of the neighbourhood of the Thames to learn to swim. This practice in an evening, and after supper, was discommended by several of his attendants; and was supposed to have stopped the bleeding at the nose, from which he had experienced such salutary effects. He could not, however, be prevailed upon to discontinue the practice; and took likewise great pleasure in walking by the river-side in moon-light to hear the sound and echo of the trumpets, by which he was undoubtedly too much exposed to the evening dews. Through impatience to meet the king his father, he rode 60 miles in one day; and having rested himself during the night, he rode the next day 36 miles to Belvoir Castle, where he met the king at the time appointed. During the heat of the season also he made several other fatiguing journeys, which must undoubtedly have contributed to impair his health. At the conclusion of the progress, he gave a grand entertainment to the court from Wednesday till Sunday evening, when the king and queen with the principal nobility attended at supper. Next day he hastened to his house at Richmond, where he expected the elector palatine, and began to give orders for his reception, also to take measures for rewarding his servants. To some of those he gave pensions, and promised to gratify the rest as soon as possible. From this time, however, his health daily declined. His countenance became more pale, and his body more emaciated: he complained now and then of drowsiness, which frequently made him ask his attendants concerning the nature and cure of an epidemic fever, probably of the putrid kind, which at that time prevailed in England, and was supposed to have been brought thither from Hungary. He now began frequently to sigh, as is usual for persons afflicted with disorders of that kind. The malady increased in the beginning of October, though he used his utmost endeavours to conceal it, and occupied himself as usual; only that now, instead of rising early in the morning as before, he would commonly keep his bed till nine. On the 10th of that month he had two slight fits of an ague, which obliged him to keep his chamber; and on the 13th his distemper seemed to be augmented by a violent diarrhoea, which, however, gave so much relief next day, that he insisted upon being removed from Richmond to St James's, in order to receive the elector palatine. On his arrival there, some of his attendants began to be alarmed by the signs of sickness which appeared upon him, though he himself made no complaint, and even allowed his physician to go to his own house. The elector arrived on the 16th, and the prince waited upon him at Whitehall; but his disease had now gained so much ground, that his temper underwent a very considerable alteration, and he became peevish and discontented with almost every thing: never-

Henry. nevertheless he still continued to give orders about what related to the ceremony of his sister's marriage; and kept company as much as he could with the elector and the count de Nassau, with whose conversation he seemed to be particularly delighted. So great was his activity even at this time, that he played a match at tennis on the 24th of October. At this time he exposed himself in his shirt, seemingly without any inconvenience; but at night he complained of a greater degree of lassitude than usual, and of a pain in his head. Next day, being Sunday, he attended divine service, and heard two sermons; after which he dined with his majesty, seemingly with a good appetite, but the paleness and ghastly appearance of his countenance was much remarked. About three in the afternoon he was obliged to yield to the violence of his distemper; being seized with a great faintness, shivering, and head-ach, with other symptoms of a fever, which from that time never left him. Several physicians were called; but they differed much in their opinions, if indeed any agreement amongst them, considering the state of medicine at that time, could have been of service. On the first of November he was bled; an operation which Dr Butler one of his physicians had hitherto opposed, but now consented to in compliance with his fellows. The impropriety of it was manifest by the thin and dissolved state of the blood which was taken away, and still more by his becoming much worse next day. As at that time the Peruvian bark, the great antidote in putrid diseases, was unknown, and no proper methods of treatment seem to have been employed, it is not to be wondered that he sunk under the disease. Among other absurd remedies used on this occasion was "a cock cloven by the back, and applied to the soles of his feet." He expired on the 6th of November 1612, at the age of 18 years 8 months and 17 days. On opening his body, the lungs were found black, spotted, and full of corrupted matter; the diaphragm was also blackened in many places; the blood-vessels in the hinder part of the head were distended with blood, and the ventricles full of water: the liver was in some places pale and lead-coloured; the gall-bladder destitute of bile, and distended with wind; and the spleen in many places unnaturally black. His funeral was not solemnized till the 7th of December following. Many funeral sermons were published in honour of him, and the two universities published collections of verses on this occasion. The most eminent poets of that age also exerted themselves in honour of the deceased prince; particularly Donne, Brown, Chapman, Drummond of Hawthornden, Dominic Baudius of Leyden, &c.

His highness's family continued together at St James's till the end of December 1612, when it was dissolved; and upon the day of their dissolution, Mr Joseph Hall, his chaplain, preached to them a most pathetic farewell sermon on Revel. xxi. 3. In this he speaks of his deceased master in the highest terms of commendation, as the glory of the nation, ornament of mankind, hope of posterity, &c.; and that he, who was compounded of all loveliness, had infused an harmony into his whole family, which was "the most loving and entire fellowship that ever met in the court of any prince." The exhortation, with which the preacher concludes, is: "Go in peace, and live as

those that have lost such a master, and as those that serve a Master whom they cannot lose." Henry.

Prince Henry was of a comely stature, about five feet eight inches; of a strong, straight, well made body, with somewhat broad shoulders and a small waist; of an amiable and majestic countenance: his hair of an auburn colour: he was long-faced, and had a broad forehead, a piercing eye, a most gracious smile, with a terrible frown. He was courteous, loving, and affable; naturally modest, and even shame-faced; most patient, which he showed both in life and death; slow to anger, so that even when he was offended he would govern it and restrain himself to silence. He was merciful to offenders, after a little punishment to make them sensible of their faults. His sentiments of piety were strong and habitual; and his zeal for the interests of religion was such, that he would, if he had lived, have used his endeavours for reconciling the divisions among its professors. He usually retired three times a-day for his private devotions, and was scarce once a month absent from the public prayers, where his behaviour was highly decent and exemplary, and his attention to the preacher the most fixed imaginable. He had the greatest esteem for all divines whose characters and conduct corresponded with their profession; but could not conceal his indignation against such as acted inconsistently with it, and he above all things abhorred flattery and vain-glory in them. He had a thorough detestation for popery, though he treated those of that religion with great courtesy; showing, that his hatred was not levelled at their persons, but their opinions. And he was so immovable in his attachment to the Protestant religion, that, not long before his death, as Sir Charles Cornwallis † assures us, † *Discourses of the most illustrious Prince Henry, by Sir Charles Cornwallis, printed in the Harleian Miscellany, vol. iv. p. 320.* he made a solemn protestation that he would never join in marriage with one of a different faith.

The prince was so exact in all the duties of filial piety, and bore so true a reverence and respect for the king his father, that though sometimes, out of his own inclination, or by the excitement of others, he moved his majesty in some things relating to the public, or his own particular interests, or those of others; yet upon the least word or look or sign given him of his majesty's disapprobation, he would instantly desist from pursuing the point, and return either with satisfaction upon finding it disagreeable to the king, or with such a resolved patience that he neither in word or action gave so much as any appearance of being displeased or discontented. He adhered strictly to justice on all occasions; and never suffered himself to determine rashly, or till after a due examination of both parties. This love of justice showed itself very early by favouring and rewarding those among his pages, and other young gentlemen placed about him, who, by men of great judgment, were thought to be of the best behaviour and most merit. And when he was but a little above five years of age, and a son of the earl of Mar, somewhat younger than himself, falling out with one of his highness's pages, did him some wrong, the prince reproved him for it, saying, "I love you, because you are my lord's son, and my cousin: but if you be not better conditioned, I will love such a one better;" naming the child who had complained of him. He was of singular

Henry. integrity, and hated flattery and dissimulation; the latter of which he esteemed a base quality, especially in a prince; nor could he ever constrain himself to treat those kindly who did not deserve his love. A nobleman in the highest favour with the king had written to him, by special command of his majesty, a letter, wherein he recommended to his highness a matter of very great consequence, to be instantly answered; and in his subscription had used these words, "Yours before all the world." His highness directed Sir Charles Cornwallis to draw up an answer, who, having written it, added some words of favour to the nobleman to precede the prince's signing. His highness having read and considered the letter, allowed it entirely without alteration: But with regard to the words of subscription, notwithstanding the great haste which the dispatch required, he ordered it to be new written, and the words objected to by him to be left out; alleging, that he to whom he wrote had dealt with him untruly and unfaithfully, and that his hand should never affirm what his heart did not think. His temperance, except in the article of fruit, was as eminent as his abhorrence of vanity and ostentation, which began to show themselves when he was very young. When he was taught to handle the pike, and his master instructed him both by word and example to use a kind of stateliness in marching and holding of his hand; though he learned all other things, he would not conform himself to that affected fashion: and if sometimes, upon earnest intreaty, he offered to use it, he would laugh at himself, and presently return to his own more modest and decent manner. And though he was a perfect master of dancing, he never practised it except when he was strongly pressed to it. The same modesty appeared in whatever he said or did: But it was no impediment to his generous and heroic disposition, which made him perform all his exercises best before much company and the greatest personages. His cloaths were usually very plain, except on occasions of public ceremony, or upon receiving foreign ambassadors, when he would assume a magnificence of dress, and an air of majesty, which immediately after he laid aside. Having once worn a suit of Welsh frize for a considerable time, and being told that it was too mean for him, and that he ought not to keep even a rich suit so long; his answer was, that he was not ashamed of his country cloth, and wished that it would last for ever.

In quickness of apprehension and memory few of the same age ever went beyond this prince; and fewer still in a right judgment of what he was taught. When he began to have some knowledge of the Latin tongue, being desired to choose a motto out of several sentences collected by his tutor for his use, after reading over many good ones, he pitched upon that of Silius Italicus, *Fax mentis honestæ gloria*. And being asked by the king one day, which were the best verses that he had learned in the first book of Virgil's *Æneid*, he answered these:

*Rex erat Æneas nobis, qua justior alter
Nec pietate fuit, nec bello major & armis.*

Reading likewise another verse of the same poet,

Tros Tyriusque mihi nullo discrimine agetur,

he said he would make use of it with this alteration,

Anglus Scotusque mihi nullo discrimine agetur.

Henry. Besides his knowledge of the learned languages, he spoke the Italian and French; and had made a considerable progress in philosophy, history, fortification, mathematics, and cosmography; in the two last of which he was instructed by that excellent mathematician Mr Edward Wright. He loved and endeavoured to do somewhat of every thing, and to be excellent in the most excellent. He greatly delighted in all rare inventions and arts, and military engines both at land and sea; in shooting and levelling great pieces of ordnance; in the ordering and marshaling of armies; in building and gardening; in music, sculpture, and painting, in which last art he brought over several works of great masters from all countries.

He had a just opinion of the great abilities of Sir Walter Raleigh; and is reported to have said, that "no king but his father would keep such a bird in a cage." And it is affirmed, that his highness, but a few months before his death, obtained the lands and castle of Sherburn in Dorsetshire, the confiscated estate of Sir Walter, with an intention of returning it to him. That eminent writer, soldier, and statesman, had a reciprocal regard for the prince, to whom he had designed to address a discourse "Of the Art of War by Sea," which his highness's death prevented the author from finishing. He had written likewise to the prince another "Discourse of a Maritimal Voyage, with the passages and incidents therein:" But this has never yet appeared in print. He had also intended, and, as he expresses it, hewn out a second and third volume of his General History, which were to have been directed to his highness: "but it has pleased God (says he) to take that glorious prince out of this world, to whom they were directed; whose unspeakable and never-enough lamented loss hath taught me to say with Job, *Versa est in ludum cithara mea, & organum meum in vocem flentium*."

In the government of his household and management of his revenues, though he was so very young, his example deserved to be imitated by all other princes. He not only gave orders, but saw almost every thing done himself; so that there were scarce any of his domestics whom he did not know by name. And among these there was not one even suspected papist; his directions being very peremptory for setting down the names of all communicants, that he might know if there were any of his family who did absent themselves from the communion. His family was large, consisting of few less than 500, many of them young gentlemen born to great fortunes, in the prime of their years, when their passions and appetites were strong, their reason weak, and their experience little. But his judgment, the gravity of his princely aspect, and his own example, were sufficient restraints upon them; his very eye served instead of a command; and his looks alone had more effect than the sharpest reprehensions of other princes. If any disputes or contests arose among his servants, he would put a stop to them at the beginning, by referring them to some of his principal officers, whom he thought most intelligent in points of that nature, and to understand best what compensation was due to the injured, and what reproof to the offender; so that in so numerous a family there was not so much as a blow given, nor any quarrel carried to the least height.

Though

Henry.

Though he loved plenty and magnificence in his house, he restrained them within the rules of frugality and moderation, as we have already noticed. By this economy he avoided the necessity of being rigid to his tenants, either by raising their farms or fines, or seeking or taking advantage of forfeitures. Nor was he tempted to make the profit which both law and right afforded him, of such who had in the time of former princes purchased lands belonging to his duchy of Cornwall, which could not by law be alienated from it; for he gave them, upon resuming these lands, a reasonable satisfaction. Neither did his economy restrain him from being liberal where merit or distress called for it; at the same time he was never known to give, or even promise, any thing, but upon mature deliberation. Whatever abuses were represented to him, he immediately redressed, to the entire satisfaction of the persons aggrieved. In his removal from one of his houses to another, and in his attendance on the king on the same occasions, or in progresses, he would suffer no provisions or carriages to be taken up for his use, without full contentment given to the parties. And he was so solicitous to prevent any person from being prejudiced or annoyed by himself or any of his train, that whenever he went out to hawk before harvest was ended, he would take care that none should pass thro' the corn; and, to set them an example, would himself ride rather a furlong about.

His speech was slow, and attended with some impediment, rather, as it was conceived, by custom and a long imitation of some who first instructed him, than by any defect of nature, as appeared from his having much corrected it by using at home amongst his servants, first short discourses, and then longer, as he found himself enabled to do it. Yet he would often say of himself, that he had the most unserviceable tongue of any man living.

He had a certain height of mind, and knew well how to keep his distance; which indeed he did to all, admitting no near approach either to his power or his secrets. He expressed himself, upon occasions offered, to love and esteem most such of the nobility as were most anciently descended, and most nobly and honestly disposed. He had an entire affection for his brother the duke of York and his sister Elizabeth; though sometimes, by a kind of rough play with the former, and an appearance of contradicting the latter in what he discerned her to desire, he took a pleasure in giving them, in their tender years, some exercise of their patience. A writer † of less authority than Sir Charles Cornwallis, from the latter of whom we have these particulars, adds, that the prince seemed to have more affection for his sister than his brother, whom he would often taunt till he made him weep, telling him, that he should be a bishop, a gown being fittest to hide his legs, which were subject in his childhood to be crooked.

With regard to any unlawful passion for women, to the temptations of which the prince's youth and situation peculiarly exposed him, his historian, who knew him, and observed him much, assures us, that having been present at great feasts made in the prince's house, to which he invited the most beautiful ladies of the court and city, he could not discover by his highness's behaviour, eyes, or countenance, the least appearance

of a particular inclination to any one of them; nor was he at any other time witness of such words or actions as could justly be a ground of the least suspicion of his virtue: though he observes, that some persons of that time, measuring the prince by themselves, were pleased to conceive and report otherwise of him. It is indeed asserted, by the writer of *Aulicus Coquinaria*, believed upon good grounds to be William Saunderson, Esq; author of the "Complete History of Mary Queen of Scotland, and her son and successor King James," that the Prince made court to the Countess of Essex (afterwards divorced from the Earl, and married to the Viscount Rochester), before any other lady then living. And Arthur Wilson mentions the many amorous glances which the prince gave her, till discovering that she was captivated with the growing fortunes of Lord Rochester, and grounded more hope upon him than the uncertain and hopeless love of his highness, he soon slighted her. The learned and pious antiquary, Sir Simonds D'Ewes, in a manuscript life of himself written with his own hand, and brought down to the year 1637, is positive, that "notwithstanding the inestimable Prince Henry's martial desires and initiation into the ways of godliness, the countess, being set on by the earl of Northampton her father's uncle, first caught his eye and heart, and afterwards prostituted herself to him, who first reaped the fruits of her virginity. But those sparks of grace which even then began to show their lustre in him, with those more heroic innate qualities derived from virtue, which gave the law to his more advised actions, soon raised him out of the slumber of that distemper, and taught him to reject her following temptations with indignation and superciliousness." But these authorities, Dr Birch observes, ought to have little weight to the prejudice of the prince's character, against the direct testimony in his favour from so well-informed a writer as Sir Charles Cornwallis.

The immature death of the prince concurring with the public apprehensions of the power of the papists, and the ill opinion which the nation then had of the court, gave immediate rise to suspicions of its being hastened by poison. And these suspicions were heightened by the very little concern shown by some persons in great stations. "To tell you (says Richard earl of Dorset in a letter to Sir Thomas Edmondes, of the 23d of November 1612) that our rising sun is set ere scarcely he had shone, and that with him all our glory lies buried, you know and do lament as well as we, and better than some do, and more truly; or else you are not a man, and sensible of this kingdom's loss." And it is certain, that this loss made so little impression upon the king and his favourite, that the lord viscount Rochester on the 9th of November, three days after it, wrote to Sir Thomas Edmondes to begin a negotiation for a marriage between Prince Charles and the second daughter of France. But the ambassador, who had more sense of decency, thought it improper to enter upon such an affair so soon after the late prince's death. Mr Beaulieu, secretary to Sir Thomas Edmondes, in a letter of the 12th of November 1612, to Mr Trumbull, then resident at Brussels, after styling the prince "the flower of his house, the glory of his country, and the admiration of all strangers, which in all places had imprinted a great hope on the minds of the

Henry.

† Francis Osborne, *Traditional Memoirs on the Reign of King James, &c.* 45.

Henry. the well-affected, as it had already stricken terror into the hearts of his enemies," adds, "who perhaps (for of this lamentable accident we have yet no particular relation) fearing the growing virtues of that young prince, have used the traiterous venom of their abominable practices to cut him off in his youth. And this I do not apprehend without cause, considering the several advertisements which I saw a month ago coming out of England, Holland, and Calais, of strange rumours which were in these parts, of some great and imminent practice in hand, for the success whereof it was written, that in some places our adversaries had made solemn prayers: and out of Calais it was especially advertised, that in your parts they were in expectation of the death of some great prince. But alas! we did little apprehend, that such ominous prognostications would have lighted upon the person of that vigorous young prince, whose extraordinary great parts and virtues made many men hope and believe, that God had reserved and destined him, as a chosen instrument, to be the standard-bearer of his quarrel in these miserable times, to work the restoration of his church, and the destruction of the Romish idolatry."

With the above notion his royal highness's mother the queen was peculiarly impressed, according to Dr Welwood; who, in his Notes on Arthur Wilson's Life of King James I. in the Complete History of England, p. 714. informs us, though without giving any authority, that when the prince fell into his last illness, the queen sent to Sir Walter Raleigh for some of his cordials, which she herself had taken some time before in a fever with remarkable success. Raleigh sent it, together with a letter to the queen, wherein he expressed a tender concern for the prince; and, boasting of his medicine, stumbled unluckily upon an expression to this purpose, "that it would certainly cure him or any other of a fever, except in case of poison." As the prince took this medicine, and died notwithstanding its virtues, the queen, in the agony of her grief, showed Raleigh's letter; and laid so much weight on the expression about poison, that as long as she lived she could never be persuaded but that the

* Court and Character of K. James, p. 77, 78.
† P. 62, 63.

prince had died by that means. Sir Anthony Weldon* suggests that the prince was poisoned. The same notion is countenanced by Wilson in his History †; and was adopted by Dr Welwood, as already mentioned: Who likewise, in another work, his *Memoirs*, after styling the prince "the darling of mankind, and a youth of vast hopes and wonderful virtues," remarks, that it was the general rumour at the time of his death, that his highness was poisoned; and that there is in print a sermon preached at St James's upon the dissolution of his family, that boldly insinuated some such thing. By this sermon Dr Welwood must mean that of Mr Hall cited above; in which, however, at least as it is reprinted in the London edition of his works in 1617 in folio, there is not to be found any expression that carries the least insinuation of that kind. The writer of the memoirs adds, that Sir Francis Bacon, in his speech at the trial of the earl of Somerset, had some reflections upon the intimacy of that lord with Sir Thomas Overbury, which seemed to point that way; there being several expressions left out of the printed copy that were in the speech. Bishop Burnet likewise tells us, that he was assured by Colonel Titus,

that he had heard King Charles I. declare, that the prince his brother was poisoned by the means of the Viscount Rochester, afterwards earl of Somerset. But it will be perhaps sufficient to oppose to all such suggestions the unanimous opinion of physicians who attended the prince during his sickness, and opened his body after his death; from which, as Dr Welwood himself observes, there can be no inference drawn that he was poisoned. To which may be added the authority of Sir Charles Cornwallis ‡, who was well informed, and above all suspicion in this point, and who pronounces the rumours spread of his highness's having been poisoned vain; and was fully convinced that his death was natural, and occasioned by a violent fever.

Life and Death of Henry, p. 81, 82.

HENRY (Philip), a pious and learned nonconformist minister, was the son of Mr John Henry, page of the back-stairs to James duke of York, and was born at Whitehall in 1631. He was admitted into Westminster-school at about 12 years of age; became the favourite of Dr Bushby, and was employed by him, with some others, in collecting materials for the Greek grammar he afterwards published. From thence he removed to Christ-church, Oxford; where, having obtained the degree of master of arts, he was taken into the family of judge Puleston, at Emerald in Flintshire, as tutor to his sons, and to preach at Worthenbury. He soon after married the only daughter and heiress of Mr Daniel Matthews of Broad-oak near Whitchurch, by whom he became possessed of a competent estate. When the king and episcopacy were restored, he refused to conform, was ejected, and retired with his family to Broad-oak: here, and in the neighbourhood, he spent the remainder of his life, about 28 years, relieving the poor, employing the industrious, instructing the ignorant, and exercising every opportunity of doing good. His moderation in his nonconformity was eminent and exemplary; and upon all occasions he bore testimony against uncharitable and schismatical separation. In church government he wished for archbishop Usher's reduction of episcopacy. He thought it lawful to join in the common prayer in public assemblies; which, during the time of his silence and restraint, he commonly attended with his family with reverence and devotion.

HENRY (Matthew), an eminent dissenting minister and author, was the son of the former, and was born in the year 1662. He continued under his father's care till he was 18 years of age; in which time he became well skilled in the learned languages, especially in the Hebrew, which his father had rendered familiar to him from his childhood; and from first to last the study of the scriptures was his most delightful employment. He completed his education in an academy kept at Islington by Mr Doolittle, and was afterwards entered in Gray's-Inn for the study of the law; where he became well acquainted with the civil and municipal law of his own country, and from his application and great abilities it was thought he would have become very eminent in that profession. But at length, resolving to devote his life to the study of divinity, in 1686 he retired into the country, and was chosen pastor of a congregation at Chester, where he lived about 25 years, greatly esteemed and beloved by his people. He had several calls from London, which he constantly declined; but was at last prevailed upon to accept an

Henry. unanimous invitation from a congregation at Hackney. He wrote, 1. Expositions of the Bible, in 5 vols folio. 2. The life of Mr Philip Henry. 3. Directions for daily communion with God. 4. A method for prayer. 5. Four discourses against vice and immorality. 6. The communicant's companion. 7. Family hymns. 8. A scriptural catechism. And, 9. A discourse concerning the nature of schism. He died of an apoplexy at Nantwich, when upon a journey, in 1714; and was interred at Trinity-church in Chester.

HENRY (Dr Robert), author of the "History of Great Britain, written on a new plan," was the son of James Henry farmer at Muirtown in the parish of St Ninian's, North Britain, and of Jean Galloway daughter of ——— Galloway of Burrowmeadow in Stirlingshire. He was born on the 18th of February 1718; and having early resolved to devote himself to a literary profession, was educated first under a Mr John Nicolson at the parish-school of St Ninian's, and for some time at the grammar-school of Stirling. He completed his course of academical study at the university of Edinburgh, and afterwards became master of the grammar-school of Annan. He was licensed to preach on the 27th of March 1746, and was the first licentiate of the presbytery of Annan after its erection into a separate presbytery. Soon after, he received a call from a congregation of Presbyterian dissenters at Carlisle, where he was ordained in November 1748. In this station he remained 12 years, and on the 13th of August 1760 became pastor of a dissenting congregation in Berwick upon Tweed. Here he married, in 1763, Ann Balderston daughter of Thomas Balderston surgeon in Berwick; by whom he had no children, but with whom he enjoyed to the end of his life a large share of domestic happiness. He was removed from Berwick to be one of the ministers of Edinburgh in November 1768; was minister of the church of the New Grey Friars from that time till November 1776; and then became colleague-minister in the old church, and remained in that station till his death. The degree of Doctor in Divinity was conferred on him by the university of Edinburgh in 1770; and in 1774 he was unanimously chosen moderator of the general assembly of the church of Scotland, and is the only person on record who obtained that distinction the first time he was a member of assembly.

From these facts, which contain the outlines of Dr Henry's life, few events can be expected to suit the purpose of the biographer. Though he must have been always distinguished among his private friends, till he was translated to Edinburgh he had few opportunities of being known to the public. The composition of sermons must have occupied a chief part of his time during his residence at Carlisle, as his industry in that station is known to have rendered his labours in this department easy to him during the rest of his life. But even there he found leisure for other studies; and the knowledge of classical literature, in which he eminently excelled, soon enabled him to acquire an extent of information which qualified him for something more important than he had hitherto in his view.

Soon after his removal to Berwick, he published a scheme for raising a fund for the benefit of the widows and orphans of Protestant dissenting ministers in the

north of England. This idea was probably suggested by the prosperity of the fund which had almost 30 years before been established for a provision to ministers widows, &c. in Scotland. But the situations of the clergy of Scotland were very different from the circumstances of dissenting ministers in England. Annuities and provisions were to be secured to the families of dissenters, without subjecting the individuals (as in Scotland) to a proportional annual contribution, and without such means of creating a fund as could be the subject of an act of parliament to secure the annual payments. The acuteness and activity of Dr Henry surmounted these difficulties; and, chiefly by his exertions, this useful and benevolent institution commenced about the year 1762. The management was entrusted to him for several years; and its success has exceeded the most sanguine expectations which were formed of it. The plan itself, now sufficiently known, it is unnecessary to explain minutely. But it is mentioned here, because Dr Henry was accustomed in the last years of his life to speak of this institution with peculiar affection, and to reflect on its progress and utility with that kind of satisfaction which a good man can only receive from "the labour of love and of good works."

It was probably about the year 1763 that he first conceived the idea of his History of Great Britain: a work already established in the public opinion; and which will certainly be regarded by posterity, not only as a book which has greatly enlarged the sphere of history, and gratifies our curiosity on a variety of subjects which fall not within the limits prescribed by preceding historians, but as one of the most accurate and authentic repositories of historical information which this country has produced. The plan adopted by Dr Henry, which is indisputably his own, and its peculiar advantages, are sufficiently explained in his general preface. In every period, it arranges, under separate heads or chapters, the civil and military history of Great Britain; the history of religion; the history of our constitution, government, laws, and courts of justice; the history of learning, of learned men, and of the chief seminaries of learning; the history of arts; the history of commerce, of shipping, of money or coin, and of the price of commodities; and the history of manners, virtues, vices, customs, language, dress, diet, and amusements. Under these seven heads, which extend the province of an historian greatly beyond its usual limits, every thing curious or interesting in the history of any country may be comprehended. But it certainly required more than a common share of literary courage to attempt on so large a scale a subject so intricate and extensive as the history of Britain from the invasion of Julius Cæsar. That Dr Henry neither over-rated his powers nor his industry, could only have been proved by the success and reputation of his works.

But he soon found that his residence at Berwick was an insuperable obstacle in the minute researches which the execution of his plan required. His situation there excluded him from the means of consulting the original authorities; and though he attempted to find access to them by means of his literary friends, and with their assistance made some progress in his work, his information was notwithstanding so incomplete, that he found it impossible to prosecute his plan

Henry.

to his own satisfaction, and was at last compelled to relinquish it.

By the friendship of Gilbert Laurie, Esq; late lord provost of Edinburgh, and one of his majesty's commissioners of excise in Scotland, who had married the sister of Mrs Henry, he was removed to Edinburgh in 1768; and it is to this event that the public are indebted for his prosecution of the History of Great Britain. His access to the public libraries, and the means of supplying the materials which these did not afford him, were from that time used with so much diligence and perseverance, that the first volume of his History in quarto was published in 1771, the second in 1774, the third in 1777, the fourth in 1781, and the fifth (which brings down the History to the accession of Henry VII.) in 1785. The subject of these volumes comprehends the most intricate and obscure periods of our history; and when we consider the scanty and scattered materials which Dr Henry has digested, and the accurate and minute information which he has given us under every chapter of his work, we must have a high opinion both of the learning and industry of the author, and of the vigour and activity of his mind: especially when it is added, that he employed no amanuensis, but completed the manuscript with his own hand; and that, excepting the first volume, the whole book, such as it is, was printed from the original copy. Whatever corrections were made on it, were inserted by interlineations, or in revising the proof-sheets. He found it necessary, indeed, to confine himself to a first copy, from an unfortunate tremor in his hand, which made writing extremely inconvenient, which obliged him to write with his paper on a book placed on his knee instead of a table, and which unhappily increased to such a degree that in the last years of his life he was often unable to take his victuals without assistance. An attempt which he made after the publication of the fifth volume to employ an amanuensis did not succeed. Never having been accustomed to dictate his compositions, he found it impossible to acquire a new habit; and though he persevered but a few days in the attempt, it had a sensible effect on his health, which he never afterwards recovered.—An author has no right to claim indulgence, and is still less intitled to credit, from the public for any thing which can be ascribed to negligence in committing his manuscripts to the press; but considering the difficulties which Dr Henry surmounted, and the accurate research and information which distinguish his history, the circumstances which have been mentioned are far from being uninteresting, and must add considerably to the opinion formed of his merit among men who are judges of what he has done. He did not profess to study the ornaments of language; but his arrangement is uniformly regular and natural, and his style simple and perspicuous. More than this he has not attempted, and this cannot be denied him. He believed that the time which might be spent in polishing or rounding a sentence was more usefully employed in investigating and ascertaining a fact: And as a book of facts and solid information, supported by authentic documents, his history will stand a comparison with any other history of the same period.

But Dr Henry had other difficulties to surmount than those which related to the composition of his

work. Not having been able to transact with the booksellers to his satisfaction, the five volumes were originally published at the risk of the author. When the first volume appeared, it was censured with an unexampled acrimony and perseverance. Magazines, reviews, and even newspapers, were filled with abusive remarks and invectives, in which both the author and the book were treated with contempt and scurrility. When an author has once submitted his works to the public, he has no right to complain of the *just* severity of criticism. But Dr Henry had to contend with the inveterate scorn of malignity. In compliance with the usual custom, he had permitted a sermon to be published which he had preached before the society in Scotland for propagating Christian knowledge in 1773; a composition containing plain good sense on a common subject, from which he expected no reputation. This was eagerly seized on by the adversaries of his History, and torn to pieces with a virulence and asperity which no want of merit in the sermon could justify or explain. An anonymous letter had appeared in a newspaper to vindicate the History from some of the unjust censures which had been published, and asserting from the real merit and accuracy of the book the author's title to the approbation of the public. An answer appeared in the course of the following week, charging him, in terms equally confident and indecent, with having written this letter in his own praise. The efforts of malignity seldom fail to defeat their purpose, and to recoil on those who direct them. Dr Henry had many friends, and till lately had not discovered that he had any enemies. But the author of the anonymous vindication was unknown to him, till the learned and respectable Dr Macqueen, from the indignation excited by the confident petulance of the answer, informed him that the letter had been written by him. These anecdotes are still remembered. The abuse of the History, which began in Scotland, was renewed in some of the periodical publications in South Britain; though it is justice to add (without meaning to refer to the candid observations of English critics), that in both kingdoms the asperity originated in the same quarter, and that paragraphs and criticisms written at Edinburgh were printed in London. The same spirit appeared in *Strictures* published on the second and third volumes; but by this time it had in a great measure lost the attention of the public. The malevolence was sufficiently understood, and had long before become fatal to the circulation of the periodical paper from which it originally proceeded. The book, though printed for the author, had sold beyond his most sanguine expectations; and had received both praise and patronage from men of the first literary characters in the kingdom: and though, from the alarm which had been raised, the booksellers did not venture to purchase the property till after the publication of the fifth volume, the work was established in the opinion of the public, and at last rewarded the author with a high degree of celebrity, which he happily lived to enjoy.

In an article relating to Dr Henry's life, not to have mentioned the opposition which his History encountered, would have been both affectation and injustice. The facts are sufficiently remembered, and are unfortunately too recent to be more minutely explained.

That

Henry.

Henry.

That they contributed at first to retard the sale of the work is undeniable, and may be told without regret now that its reputation is established. The book has raised itself to eminence as a History of Great Britain by its own merits; and the means employed to obstruct its progress have only served to embellish its success.

Dr Henry was no doubt encouraged from the first by the decided approbation of some of his literary friends, who were allowed to be the most competent judges of his subject; and in particular by one of the most eminent historians of the present age, whose history of the same periods justly possesses the highest reputation. The following character of the first and second volumes was drawn up by that gentleman, and is well intitled to be inserted in a narrative of Dr Henry's life. "Those who profess a high esteem for the first volume of Dr Henry's history, I may venture to say, are almost as numerous as those who have perused it, provided they be competent judges of a work of that nature, and are acquainted with the difficulties which attend such an undertaking. Many of those who had been so well pleased with the first were impatient to see the second volume, which advances into a field more delicate and interesting; but the Doctor hath shown the maturity of his judgment, as in all the rest, so particularly in giving no performance to the public that might appear crude or hasty, or composed before he had fully collected and digested the materials. I venture with great sincerity to recommend this volume to the perusal of every curious reader who desires to know the state of Great Britain in a period which has hitherto been regarded as very obscure, ill supplied with writers, and not possessed of a single one that deserves the appellation of a good one. It is wonderful what an instructive, and even entertaining, book the Doctor has been able to compose from such unpromising materials: *Tantum series juncturaque pollet*. When we see those barbarous ages delineated by so able a pen, we admire the oddness and singularity of the manners, customs, and opinions, of the times, and seem to be introduced into a new world; but we are still more surprised, as well as interested, when we reflect that those strange personages were the ancestors of the present inhabitants of this island.—The object of an antiquary hath been commonly distinguished from that of an historian; for though the latter should enter into the province of the former, it is thought that it should only be *quanto basta*, that is, so far as is necessary, without comprehending all the minute disquisitions which give such supreme pleasure to the mere antiquary. Our learned author hath fully reconciled these two characters. His historical narrative is as full as those remote times seem to demand, and at the same time his inquiries of the antiquarian kind omit nothing which can be an object of doubt or curiosity. The one as well as the other is delivered with great perspicuity, and no less propriety, which are the true ornaments of this kind of writing. All superfluous embellishments are avoided; and the reader will hardly find in our language any performance that unites together so perfectly the two great points of entertainment and instruction."—The gentleman who wrote this character died before the publication of the third volume.—The progress of his work introduced Dr Henry to more extensive patronage, and in particular to the

Henry.

notice and esteem of the earl of Mansfield. That venerable nobleman, who is so well intitled to the gratitude and admiration of his country, thought the merit of Dr Henry's history so considerable, that, without any solicitation, after the publication of the fourth volume he applied personally to his Majesty to bestow on the author some mark of his royal favour. In consequence of this, Dr Henry was informed by a letter from lord Stormont, then secretary of state, of his Majesty's intention to confer on him an annual pension for life of 100 l. "considering his distinguished talents and great literary merit, and the importance of the very useful and laborious work in which he was so successfully engaged, as titles to his royal countenance and favour." The warrant was issued on the 28th of May 1781; and his right to the pension commenced from the 5th of April preceding. This pension he enjoyed till his death, and always considered it as incurring a new obligation to persevere steadily in the prosecution of his work. From the earl of Mansfield he received many other testimonies of esteem both as a man and as an author, which he was often heard to mention with the most affectionate gratitude. The octavo edition of his history, published in 1788, was inscribed to his lordship. The quarto edition had been dedicated to the king.

The property of the work had hitherto remained with himself. But in April 1786, when an octavo edition was intended, he conveyed the property to Messrs Cadell and Strachan; reserving to himself what still remained unsold of the quarto edition, which did not then exceed eighty-one complete sets. A few copies were afterwards printed of the volumes of which the first impression was exhausted, to make up additional sets: and before the end of 1786, he sold the whole to Messrs Cadell and Strachan. By the first transaction he was to receive 1000 l. and by the second betwixt 300 l. and 400 l.; about 1400 l. in all. These sums may not be absolutely exact, as they are set down from memory; but there cannot be a mistake of any consequence on the one side or the other.—Dr Henry had kept very accurate accounts of the sales from the time of the original publication; and after his last transaction with Messrs Cadell and Strachan, he found that his real profits had amounted in whole to about 3300 pounds: a striking proof of the intrinsic merit of a work which had forced its way to the public esteem unprotected by the interest of the booksellers, and in spite of the malignant opposition with which the first volumes had to struggle.

The prosecution of his history had been Dr Henry's favourite object for almost 30 years of his life. He had naturally a sound constitution, and a more equal and larger portion of animal spirits than is commonly possessed by literary men. But from the year 1785 his bodily strength was sensibly impaired. Notwithstanding this, he persisted steadily in preparing his sixth volume, which brings down the history to the accession of Edward VI. and has left it in the hands of his executors almost completed. Scarcely any thing remains unfinished but the two short chapters on arts and manners; and even for these he has left materials and authorities so distinctly collected, that there can be no great difficulty in supplying what is wanting. It is hoped that this volume may be ready for publication some time in

Henry
||
Hepar.

the winter or spring 1792; and that it will be found intitled to the same favourable reception from the public which has been given to the former volumes. It was written under the disadvantages of bad health and great weakness of body. The tremulous motion of his hand had increased so as to render writing much more difficult to him than it had ever been: but the vigour of his mind and his ardour were unimpaired; and independent of the general character of his works, the posthumous volume will be a lasting monument of the strength of his faculties, and of the literary industry and perseverance which ended only with his life.

Dr Henry's original plan extended from the invasion of Britain by the Romans to the present times. And men of literary curiosity must regret that he has not lived to complete his design; but he has certainly finished the most difficult parts of his subject. The periods after the accession of Edward VI. afford materials more ample, better digested, and much more within the reach of common readers.

Till the summer of 1790 he was able to pursue his studies, though not without some interruptions. But at that time he lost his health entirely; and, with a constitution quite worn-out, died on the 24th of November of that year, in the 73d year of his age.—He was buried in the church-yard of Polmont, where it is proposed to erect a monument to his memory.

HENTINGS, in agriculture, a term used by the farmers for a particular method of sowing before the plough; the corn being cast in a straight line just where the plough is to come, is by this means presently ploughed in. By this way of sowing they think they save a great deal of seed and other charge, a dexterous boy being as capable of sowing this way out of his hat as the most skilful seedsman.

HENTING is also a term used by the ploughmen, and others, to signify the two furrows that are turned from one another at the bottom, in the ploughing of a ridge. The word seems to be a corruption of ending, because those furrows made an end of ploughing the ridges. The tops of the ridges they call *veerings*.

HEPAR SULPHURIS, or *Liver of Sulphur*, a combination of alkaline salt and sulphur. See CHEMISTRY, n^o 1021—1025.

By means of the fume arising on the decomposition of hepar sulphuris by an acid, Mr Bergman hath found a method of imitating the hot or sulphureous mineral waters, to as great perfection as the cold ones are now imitated by fixed air. The process consists simply in adding the vitriolic acid to hepar sulphuris, and impregnating water with the peculiar species of air that arises from this mixture; in the same manner as when water is impregnated with the fixed air arising from the mixture of that or any other acid with chalk. This *hepatic air*, as the author calls it, is very readily absorbed by water; to which it gives the smell, taste, and all the other sensible qualities of the sulphureous waters. A Swedish cantharus of distilled water, containing 12½ Swedish cubic inches, will absorb about 60 cubic inches of this hepatic air; and on dropping into it the nitrous acid, it will appear, that a real sulphur is contained, in a state of perfect solution, in this water, to the quantity of eight grains. It does not appear that any other acid, except what the author

calls the *dephlogisticated marine acid*, will produce this effect.—When any particular sulphureous water is to be imitated, we scarce need to observe, that the saline, or other contents peculiar to it, are to be added to the artificial hepatic water. Instead of the liver of sulphur, the operator may use a mixture of three-parts of filings of iron and two parts of sulphur melted together.

It may, perhaps, be thought, that water thus prepared, does not differ from that in which a portion of the hepar sulphuris has been dissolved: but it appears evidently to differ from it in this material circumstance;—that in the solution of hepar sulphuris, the sulphur is held in solution by the water, through the means of the alkali combined with it: whereas, in Mr Bergman's process, it does not appear probable that the hepar sulphuris rises substantially in the form of air; for, in that case, its presence in the hepatic water might be detected by means of the weakest of the acids (even the mephitic), which would precipitate the sulphur from it. Nor can it be supposed that any portion or constituent part of the alkali itself (except a part of its remaining fixed air) can come over. The water, therefore, must owe its impregnation to the sulphur, raised, in some peculiar manner, into the state of an elastic vapour; permanent, when the experiment is made in quicksilver; but condensable in water, and rendered soluble in that fluid through the means of some unknown principle combined with it, and which the author supposes to be the matter of heat, combined with it through the medium of phlogiston.

HEPATIC, in medicine and anatomy, any thing belonging to the liver.

HEPATIC AIR, a permanently elastic fluid, of a very disagreeable odour somewhat like that of rotten eggs, obtained in plenty from combinations of sulphur with earths, alkalies, metals, &c. and sometimes from combinations of alkalies with substances which do not appear to contain any sulphur.

The nature of this fluid has been particularly examined by Mr Kirwan, of whose experiments we have an account in the 76th volume of the Philosophical Transactions, and of which the results are as follow.

1. By weighing it in a glass bottle exhausted in the most perfect manner by an air-pump, its specific gravity is found to be to that of common air as 10,000 to 9038.

2. Though inflammable, it never detonates with common air; nor can it be fired in a narrow-mouthed vessel, unless mixed with a considerable proportion of this air. Mr Scheele found that it would take fire when mixed with two thirds of common air; but M. Sennebier informs us that it cannot be fired by the electric spark even when mixed with any quantity of respirable air. Mr Kirwan found one part of the hepatic air, and one and a half of common air, to burn blue without flashing or detonating; and that, during the combustion, sulphur is constantly deposited, and a smell of vitriolic acid perceived. Mixed with an equal part of nitrous air, it burns with a bluish, green, and yellow lambent flame: it deposits sulphur also; and in proportion as the latter is deposited, a candle dipped in the air burns more weakly, and is at last extinguished. Two parts of nitrous and one of hepatic air burn partially

Hepar
||
Hepatic
Air.

Hepatic
Air.

tially with a green flame; the residuum extinguishing a candle, which reddens on coming into contact with the atmosphere. One part of common air being admitted to equal parts of nitrous and hepatic air, sulphur was instantly precipitated, and the three measures reduced to 2.4; which burned on the surface with a greenish flame, but extinguished the candle when sunk deeper. Four parts of hepatic, with one of common air, burned rapidly with a blue flame; and a mixture of equal parts of dephlogisticated and hepatic airs which had stood eight days, went off with a report like a pistol, and so instantaneously that the colour of the flame could scarcely be discerned.

3. Hepatic air turns the tincture of litmus red, which Bergman supposes it would not do if it were washed; but Mr Kirwan found no alteration after passing two measures through water, or even after boiling the air out of water impregnated with it. Nay, the same hepatic air which had once reddened litmus, continued to do so after being put to a fresh quantity of the tincture.

4. There is a considerable difference in the miscibility of hepatic air with water according to the materials from which the former is made. By slight agitation, water in the temperature of 66° imbibes two thirds of its bulk of air extracted from alkaline or calcareous hepar by means of marine acid. An equal quantity of water dissolves three-fourths of its bulk of hepatic air extracted by the same acid from martial hepar; eight-tenths of that extracted by means of the concentrated vitriolic acid, or the dilute nitrous or saccharine acids in the temperature of 60° ; seven-tenths of that extracted by sedative acid; nine-tenths of that made with the acetous acid, and of that afforded by oil of olives; and lastly, its own bulk of that produced from a mixture of sugar and sulphur. In general, however, that produced by the greatest degree of heat seemed to be the most easily miscible; though in some instances, particularly that of acetous hepatic air, this does not take place.

5. The union between hepatic air and water is not permanent. Even when the water has been boiled in order to expel the air it naturally contains previous to its union with the hepatic air, the fluid grows very soon turbid, and deposits the hepatic air in the form of sulphur, though the bottle be ever so well corked, or stand inverted in water or mercury. The absorption of the air by water, however, does not seem to occasion any decomposition in the former, as the quantity left will be absorbed like the former by adding more water. It cannot be expelled from water till it comes near the boiling point.

6. No kind of hepatic air, excepting that produced from charcoal, precipitates lime from lime-water; and even this does it only in a very slight degree, unless a large quantity of air pass through a small one of water.

7. The most sensible test of the presence of hepatic air is the solution of silver in the nitrous acid. This, according as the nitrous acid is more or less saturated with silver, becomes black, brown, or reddish brown, by the contact with hepatic air, however mixed with common air or any other permanently elastic fluid. When the acid is not saturated, or is in large proportion, the brown or black precipitate, which is nothing but sulphurated silver, is redissolved.

Hepatic
Air.

8. All hepatic air suffers some diminution by standing over mercury, and blackens the surface of the metal; particularly that made from charcoal.

9. Mixtures of hepatic air with common, dephlogisticated, and phlogisticated airs, continued for a long time either totally undiminished or very little so, as did those also with inflammable marine acid air and fixed air; only blackening the surface of the mercury.

10. Two measures of hepatic air being introduced to two of vitriolic air, a whitish yellow deposition immediately covered the top and sides of the jar, and both airs were without any agitation reduced to little more than one measure. As the glass, however, was obscured by a whitish scurf over its whole inside, it was found necessary to repeat the experiment. One cubic inch of hepatic air was then added to five of vitriolic air; and, in less than a minute, without any agitation, the sides of the glass were covered with a whitish scum apparently moist, and a diminution of more than one ounce measure took place. In four hours after, a second measure of hepatic air was introduced; which was followed by a second deposition of whitish matter and diminution of the air. Next day three other measures were added at the interval of four hours between each; when, finding still a farther diminution, another measure was added next day. The whole quantity of 11 ounce measures was thus reduced at last to three, which seemed to be little else than phlogisticated air. The water in which the sulphur precipitated from the hepatic air was washed, and appeared to contain some vitriolic acid and fixed air.

11. A mixture of two measures of nitrous, and as much hepatic air, was little altered at first even by agitation; but, on standing 36 hours, both were reduced by something more than one third of the whole. The mercury was not blackened, but particles of yellow sulphur were deposited both upon the sides of the glass and the surface of the metal. The air which remained had still an hepatic smell, and was somewhat more diminished by water: a candle burned naturally in the unabsorbed part. The water had all the properties of that which had absorbed hepatic air. On adding nine cubic inches of nitrous air to eight of hepatic, a yellowish cloud instantly appeared, a slight white scum was deposited on the sides of the jar; and the whole seemed to be diminished about two cubic inches, the temperature of the room being then 72° . In 48 hours the whole was reduced to six cubic inches, and the top and sides of the jar covered with a cake of white sulphur; the heat of the room being constantly between 60 and 70° . The residuum was examined in 24 hours after, and had a pretty strong smell of alkaline air. A candle burned in it naturally; and it did not affect tincture of litmus, lime-water, or acetous barytes. It was not affected by any kind of air except the dephlogisticated kind, and this produced only a slight redness and diminution; it produced also a slight white precipitate in solution of silver. Hence it appeared that this was *dephlogisticated nitrous air*, or, as our author thinks, it ought rather to be called *deacidified nitrous air*.

12. Mr Kirwan supposing that an uncombined acid in the nitrous air was the cause of precipitation, he deprived some nitrous air of this acid as perfectly as possible before mixing it with hepatic air; which was done.

Hepatic
Air.

done by admitting alkaline air to it, and then washing out the ammoniacal compound in distilled water. By being deprived of its acid it lost about one-sixth of its bulk; and it was diminished by common air in the same manner that nitrous air usually is. Seven cubic inches of hepatic air were then admitted all at once to eight of the purified nitrous air. No cloud or other mark of any precipitation appeared: but in six hours the whole was reduced to five cubic inches, the temperature of the room being 76° ; but the diminution went no further in 18 hours after. A much whiter sulphur was deposited than in the former experiment; and both in this and the former, that part which was intercepted by the rising of the mercury betwixt the metal and the side of the jar was of a yellow and red shining colour, and not black, as that deposited in mercury usually is. The residuum flashed with such violence as to extinguish a candle dipped into it, the flame being exceedingly white and vivid; though it did not detonate in the least, but rather appeared like dephlogisticated air. The jar out of which it had been transferred had a strong alkaline smell. It was not in the least diminished by nitrous air, even when heated to 150 degrees. Water poured into the jar in which the sulphur was deposited produced a bluish white cloud in solution of silver, though insipid to the taste; whence it appears, that whatever this air may be, it had been deacidified by hepatic air still more perfectly than that in which a candle burns naturally, but was by no means dephlogisticated.

13. Perfectly pure alkaline and hepatic airs mixed together would probably destroy each other; but Mr Kirwan never had it in his power to do this entirely. Six measures of hepatic air from liver of sulphur, and six of alkaline air, immediately throw up a white cloud, leaving a whitish scum on the side of the jar, and are reduced to about one ounce measure. On adding water this is reduced to about one half; and a candle burns naturally in it. This residuum, however, was afterwards found to be only the common air of the vessels.

14. One measure of oil of vitriol, of the specific gravity of 1.863, absorbed two measures of hepatic air all to one-tenth; the acid being whitened by a copious deposition of sulphur.

15. A measure of red nitrous acid, of the specific gravity of 1.430, was introduced to an equal measure of hepatic air: red vapours instantly arose; and only one-tenth or one-twelfth of a measure remained in an aerial form; but as the acid acted on the mercury, it was necessary to use water, by which the whole was absorbed. No sulphur was precipitated on this occasion. The experiment was repeated in another manner, but with little success; so that Mr Kirwan, finding it so difficult to use the concentrated nitrous acid, determined to try its effects upon hepatic air by diluting the acid to such a degree that it could not act upon mercury without the assistance of heat. In this case the acid was whitened, eight-tenths of the air absorbed, and the residuum detonated. A still greater quantity was absorbed when the experiment was made with hepatic air made from liver of sulphur; but the residuum, instead of detonating, burned with a blue and greenish flame, depositing sulphur upon the sides of the jar. This dilute acid absorbed about three

times its bulk of hepatic air; but on expelling the same from it again by heat, the sixth part only was obtained, and in this a candle burned naturally.

16. Two measures of alkaline hepatic air were absorbed by one of strong marine acid to one-fifth of a measure, after a slight agitation. On adding a third measure of hepatic air, the whole was absorbed to half a measure. The sulphur precipitated in this experiment was attracted by the mercury, and blackened it; which did not happen in the former cases, by reason of the stronger attraction of the acid for the sulphur. The residuum burned as pure hepatic air.

17. Distilled vinegar absorbs nearly its own bulk of hepatic air, and becomes slightly whitened; but by agitation it may be made to take up about twice its bulk, and then becomes very turbid.

18. One measure of caustic vegetable alkali, the specific gravity of which was 1.043, absorbed nearly four measures of alkaline hepatic air, which rendered it brown at first, but after some time it grew clear and deposited sulphur, blackening the surface of the mercury.

19. One measure of caustic volatile alkali, of the specific gravity of 0.9387, absorbed 18 of hepatic air. A greater quantity of alkali would absorb more hepatic air, six measures of the alkaline air uniting to seven of the hepatic; and thus the strength of alkaline liquors, and their real contents, may, according to our author, be determined better than by any other method. The smoking liquor of Boyle (a strong volatile tincture of sulphur) may be easily prepared by putting volatile alkali in the middle vessel of Dr Nooth's apparatus, and decomposing liver of sulphur, or artificial pyrites in the lowermost one by means of marine acid.

20. Olive oil absorbs nearly its own bulk of hepatic air, and gets a greenish tinge from it.

21. Oil of turpentine absorbs more than its own bulk of this air, but then becomes turbid. A white cloud appears when water is put to the mixture.

22. Spirit of wine, of the specific gravity of 0.835, absorbed nearly three times its bulk of hepatic air, and became brown. Thus sulphur may be combined with spirit of wine more easily than by the method used by Count Louragais, the only one hitherto known. Water partly precipitates the sulphur.

23. New milk scarcely absorbs one-tenth of its bulk of this air, and is not in the least coagulated.

24. With an equal bulk of vitriolic ether the bulk of the air is at first increased; but afterwards one-half is absorbed, and a slight precipitation appears. The smell is compounded of that of ether and hepatic air; but on adding water it becomes very offensive, resembling that of putrefying animal substances.

25. On adding a measure and an half of nitrous solution of silver to one of hepatic air, the latter was absorbed immediately, and without any agitation, the solution at the same time becoming black. The remaining air admitted a candle to burn naturally in it. Hepatic air was likewise absorbed, but with more difficulty, and in smaller quantity, by the vitriols of iron and silver; the latter was blackened; the former became white at first, but darker by agitation; the residuum burned blue, as hepatic air usually does.

Hepatic
Air.

Hepatic
Air.

26. Sulphurated spirit of wine precipitates lime-water, which highly rectified spirit of wine will also do by itself. It also precipitates and gives a brown colour to acetous baro-selenite, which is likewise done by spirit of wine: the solution of silver is turned black or brown by it. Sulphur is precipitated from it by concentrated vitriolic acid, which cannot be done either by the nitrous or muriatic acids.

27. Water saturated with hepatic air turns the tincture of litmus red; does not affect lime-water; forms a cloud in the solution of acetous baro-selenite, though not in that of the marine: it does not alter the solutions of other earths. It produces a white precipitate in the solution of vitriol of iron, or solution of that metal in spirit of salt: in nitrous solution of copper it throws down a brown precipitate, and the colour of the liquid is changed from blue to green; the precipitate being redissolved by agitation. In solution of vitriol of copper it forms a black precipitate. It throws down a yellowish white precipitate in solution of tin in aqua-regia; a black one from solution of gold; a red and yellow one from that of antimony; and one of red mixed with white from solution of platina. Black precipitates are formed with nitrous solutions of lead and silver; but if these are not perfectly saturated with metal, the solutions will be brown, or reddish brown, and may be redissolved by agitation. Nitrous solution of mercury is precipitated of a yellowish brown; corrosive sublimate of a yellow mixed with black, but which becomes white by agitation. Nitrous solution of bismuth becomes reddish brown, and even assumes a metallic appearance. Solution of cobalt becomes dark; that of arsenic in nitrous acid becomes yellow, mixed with red and white; forming realgar and orpiment. On dropping into hepatic water oil of vitriol of the specific gravity of 1.863, the mixture becomes slightly turbid; but on dropping into it the volatile vitriolic acid, a bluish white and much denser cloud is formed. A copious white precipitation is occasioned by the strong nitrous acid, whether phlogisticated or not; but dilute nitrous acid produces no change. Green nitrous acid, the specific gravity 1.328, instantly produces sulphur. A slight cloud is produced by strong marine acid; but neither distilled vinegar nor acid of sugar has any such effect. According to Mr Bergman, hepatised water, in a well closed vessel, will dissolve iron in a few days; but the experiment did not succeed with Mr Kirwan, neither could he dissolve any other metal in this water, though the sulphur united with many of them into an insoluble mass; whence our author concludes, that metallic substances cannot be found in hepatised waters.

28. Colourless alkaline liquors acquire a brownish tinge from hepatic air; the residuum they leave being of the same nature with what they absorb. A caustic fixed alkaline liquor, saturated with this air, precipitates barytes from the acetous acid of a yellowish white colour; decomposing likewise other earthy solutions, and the precipitate varying according to their purity; a test which our author supposes may be improved to such a degree as to supply the place of the Prussian alkali. It precipitates also solution of vitriol of iron as well as marine salt of iron, of a black colour; but the latter generally whitens by agitation. Solutions of silver and lead are also precipitated black with some mix-

ture of white: that of gold is also blackened; and solution of platina becomes brown. Solutions of copper let fall a reddish black or brown precipitate. Sublimate yields a precipitate partly white and black, and partly orange and greenish. A nitrous solution of arsenic forms a yellow and orange precipitate; and that of regulus of antimony in aqua regia, an orange precipitate mixed with black. Nitrous solution of zinc yields a dirty white precipitate; that of bismuth a brown mixed with white; and that of cobalt a brown and black precipitate. Prussian alkali yields a purple precipitate, which is easily redissolved. Tincture of radishes, our author's test for alkalies, was turned green.

29. On adding a few grains of iron, copper, lead, tin, zinc, bismuth, regulus of antimony, and arsenic, to a solution of liver of sulphur, all the metals were found to attract sulphur from the fixed alkali, excepting zinc and tin. Iron, arsenic, regulus of antimony, and lead, were most altered; copper next, and bismuth the least. No part of the metals appeared to be dissolved.

30. Water saturated with the condensed residuum of alkaline and hepatic air, *i. e.* with the purest volatile liver of sulphur, does not precipitate marine selenite, though it forms a slight brown and white cloud in that of marine baro-selenite. It throws down a black precipitate in solution of vitriol of iron, and a black and white one in that of marine salt of iron; but by agitation this became entirely white. Vitriol of copper, and nitrous salt of the same metal, are both precipitated of a brown and red colour. Tin dissolved in aqua-regia yields a yellowish precipitate; gold, a dilute yellow and reddish brown; platina, a flesh-coloured precipitate; and regulus of antimony, a yellowish red. Silver is precipitated black, as well as lead, from the nitrous and acetous acids. Corrosive sublimate became red for a moment; but in a little time its precipitate appeared partly black and partly white. A similar precipitate is afforded also by the nitrous solution of bismuth; but partly mixed with a reddish-brown colour, and has something likewise of a metallic appearance; the precipitate of cobalt is black, or deep brown. Solutions of arsenic yield precipitates of a yellow colour, and more or less red; those of zinc of a dirty white.—All these colours, however, vary, as the liquors are more or less saturated previously to and after their mixture, and the time they have stood together.

From these experiments Mr Kirwan concludes, that hepatic air consists merely of sulphur rarefied by elementary fire, or the matter of heat. Some have supposed that it consists of liver of sulphur itself volatilised; but this our author denies, for the following reasons: 1. It is evidently, tho' weakly, acid; reddening litmus, and precipitating acetous baro-selenite, though none of the other solutions of earths. 2. It may be extracted from materials which either contain no alkali at all, or next to none; as iron, sugar, oil, charcoal, &c. 3. It is not decomposed by marine or fixed air; by which nevertheless liver of sulphur may be decomposed.

Our author informs us, that he was formerly of opinion that sulphur was held in solution in hepatic air, either by means of vitriolic or marine air: but neither of these is essential to the constitution of hepatic air as such, since it is producible from materials that contain neither of these acids; and from whatever substance

Hepatic
Air.

Hepatic
Air.

it is obtained, it always affords the same character, viz. that of the vitriolic acid exceedingly weakened, such an acid as we may suppose sulphur itself to be. This substance indeed, even in its concrete state, manifests the properties of an acid, by uniting with alkalies, calcareous and ponderous earths, as well as with most metals, which a very weak acid might be supposed to do.

As phosphorus bears a considerable resemblance in its constitution to sulphur, Mr Kirwan determined to make some experiments upon it in similar circumstances. He therefore gently heated 10 or 12 grains of phosphorus mixed with about half an ounce of caustic fixed alkaline solution in a very small vial furnished with a bent tube, and received the air over mercury. Two small explosions took place on the first application of heat, attended with a yellow flame and white smoke, which penetrated through the mercury into the receiver. This was followed by an equable production of air; but at last the phosphorus began to swell and froth up, burst with a loud explosion, and a violent flame immediately issued from it. Only about eight cubic inches of air were obtained. These were but very slightly diminished by agitation in water; after which a cloudiness took place, but the air soon recovered its transparency. Water impregnated with it slightly reddened tincture of litmus, but did not affect Prussian alkali. It had no effect upon the nitrous solutions of copper, lead, zinc, or cobalt; nor on those of iron or tin in marine acid and aqua-regia; nor on the vitriolic solutions of iron, copper, tin, lead, zinc, regulus of antimony, arsenic, or manganese; nor on the marine solutions of iron, copper, lead, zinc, cobalt, arsenic, or manganese. The nitrous solution of silver was precipitated of a black colour, and the vitriolic of a brown: nitrous solution of mercury, made without heat, precipitated a brown or black powder; but vitriol of mercury first became reddish, and afterwards white: corrosive sublimate a yellow mixed with red and white. Gold dissolved in aqua-regia is precipitated of a purplish black, and in the vitriolic acid of a brownish red and black; but regulus of antimony dissolved in aqua-regia is precipitated of a white colour. Nitrous solution of bismuth let fall a sediment at first white, and afterwards brown; vitriol of bismuth and marine salt of bismuth were also precipitated brown, the latter being redissolved by agitation. Nitrous solution of arsenic also became brown, but the precipitate was redissolved by agitation. On impregnating water with this air, without allowing the air to burn over it, the liquid scarcely made any alteration in tincture of litmus, nor did it precipitate lime-water; but caused a black precipitate in solution of silver; a white one in solution of regulus of antimony in aqua-regia, and a whitish yellow one in that of corrosive sublimate.

On letting up a measure of water to this air, and through that some bubbles of common air, every bubble flamed, and produced a white smoke until about half the quantity of common air was introduced that had been used of phosphoric; but without any apparent increase of the original bulk. The flame produced a small commotion each time, and smoke descended after the inflammation into the water; the smoke still continuing to be produced on the introduction of common air, after the flame had ceased. Bubbles of phosphoric air, escaping through mercury in
N^o 151.

to the atmosphere, flame, crackle, and smell, exactly like the electric spark. This property of phosphoric hepatic air was known to M. Gingembre in the year 1783.

On letting up half a measure of nitrous to one of phosphoric air, a white smoke appeared, with a very slight diminution; the transparency being soon restored, and a slight scum deposited on the sides of the jar. No smoke or diminution was produced by adding another half measure of nitrous air; but on adding water, and agitating the air in it, much more was absorbed. On turning up the jar, the nitrous air first escaped in form of a red vapour, and this was followed by a whitish smoke. The water had a phosphoric smell, and precipitated the solution of silver brown.

An equal measure of alkaline air scarce diminished phosphoric air; and on adding water, little more seemed to be taken up than the alkaline air, though a smoke appeared on turning up the jar, but without any flame. Water thus impregnated smelled exactly like onions, and turned the tincture of radishes green. Solution of silver was precipitated of a black colour; that of copper in the nitrous acid, of a brown; the precipitate being redissolved by agitation, and the liquor then assuming a green colour. Corrosive sublimate let fall a yellow precipitate mixed with black. Iron was precipitated white both from the vitriolic and marine acids; but a pale yellow solution of it in the nitrous acid was not affected, and a red solution in the same acid was only clotted. Regulus of antimony was precipitated of a white colour from aqua-regia, cobalt of a slight reddish from the nitrous acid, and bismuth of a brown colour from the same. Neither the nitrous solutions of lead or zinc were affected; nor those of tin in the marine acid or in aqua-regia. Fixed air, mixed with an equal proportion of phosphoric air, produced a white smoke, some diminution, and a yellow precipitate. On agitating the mixture in water the fixed air was taken up all to one-tenth; the residuum smoked, but did not take fire.

Some precipitate *per se* being introduced to a small portion of phosphoric air, the former soon grew black, and a white smoke appeared. In two days the precipitate became solid, acquiring a pale white colour, shining like steel. The air lost its inflammability; though Mr Kirwan supposes that this might be owing to some other cause: for two days after this air was made, a yellow scum was observed on the sides of the jar in which a quantity of it had rested all night over water; and the spontaneous inflammability was lost next morning. The temperature of the air was then 53°; and when it inflamed before 68°.

From these experiments our author concludes, that phosphoric air is nothing else but phosphorus itself in an aerial state; differing from sulphureous or hepatic air in this, that it requires much less latent heat to throw it into an aerial state, and therefore may be disengaged from fixed alkalies without any acid.

Hepatic air may be obtained in a great number of different ways, and from a variety of substances. The most common method in which it has been procured, is by decomposing the hepar sulphuris or combination of sulphur and fixed alkaline salt by means of an acid. Mr Kirwan has examined the circumstances attending the formation of liver of sulphur; making his first experiments

Hepatic
Air.

Hepatic
Air.Hepatic
Air.

periment by melting together equal parts of the mineral alkali and flowers of sulphur in a covered crucible. On slightly heating the mixture, it emitted a bluish smoke, which gradually became whiter as the heat was augmented; and at last, when the bottom of the crucible became slightly red, the smoke was perfectly white and inflammable. To investigate the nature of this smoke, a pure fixed alkali was made by deflagrating equal parts of cream of tartar and nitre in a red-hot crucible in the usual way. This alkali, in a very dry state, was mixed with a small quantity of flowers of sulphur, and the mixture distilled in a small coated retort; the air being received over quicksilver.

On the first application of heat, one cubic inch and an half of slightly phlogisticated air was obtained, but without any fixed air. This was the common air contained in the vessels, but altered by being in contact with the alkali and sulphur. On augmenting the heat, about 18 inches of air were obtained, of a reddish colour, seemingly a mixture of nitrous and common air; acting slightly on mercury. After this, 20 cubic inches of the same kind mixed with some fixed air were obtained. These were succeeded by 64 inches of fixed air almost perfectly pure. The bottom of the retort was now red-hot; some sulphur was sublimed in the neck; and when all was cold, an hepar sulphuris was found in the bulb.

From this experiment Mr Kirwan concludes, that the blue smoke above mentioned consists chiefly of fixed air and the white of sulphur; but that neither hepatic nor vitriolic air are formed unless the retort be large enough to admit as much air as is necessary for burning part of the sulphur. He concludes also, that hepar sulphuris will yield no hepatic air unless with the help of an acid; "and I believe this (says he) to be true, when the experiment is made in the dry way, and nearly so in the moist way: for having added 200 grains of sulphur to a concentrated solution of strong caustic vegetable alkali by a strong and long-continued heat, I obtained only one cubic inch of hepatic air; yet it is well known, that a strong solution of liver of sulphur constantly emits an hepatic smell, even in the temperature of the atmosphere; and the substance so emitted contains as much hepatic air as discolours silver and lead, and even their solutions; which shows that an incomparably small quantity of this air is sufficient to produce the effect. To discover whether this extrication of hepatic air might be caused by the deposition of fixed air from the atmosphere, I threw some pulverised calcareous hepar into aerated water, and by the application of heat endeavoured to obtain hepatic air, but in vain: and indeed the very circumstance that the hepatic smell and its effects are always strongest the first instant that a bottle of the hepatic solution is opened, seems to indicate that fixed air is no way concerned in its production. The best liver of sulphur is made of equal parts of salt of tartar and sulphur; but as about one-fifth of the salt of tartar consists of air which escapes during the operation, it seems that the proportion of sulphur predominates in the resulting compound; yet, as some of the sulphur also sublimes and burns, it is not easy to fix the exact proportion. One hundred grains of the best, that is to say the reddest liver of sulphur, afford with dilute marine acid about 40 inches of hepatic air in the tem-

VOL. VIII. Part II.

perature of 60°; a quantity equivalent to about 13 grains of sulphur, as will be seen in the sequel."

Hepatic air is best produced by marine acid: the concentrated nitrous acid produces nitrous air; but if diluted with 20 times its bulk of water, it produces the hepatic kind by the assistance of heat. Concentrated vitriolic acid poured upon liver of sulphur affords but little hepatic air without the assistance of heat; though it constantly decomposes the hepar: "and (adds our author) it is partly for this reason that the proportion of air is so small; for it is during the gradual decomposition of sulphureous compounds that hepatic air is produced." Hepatic air, but not in a pure state, is extricated by distilled vinegar; its smell being mixed with that of the vegetable acid. Some quantity of this air is produced by the saccharine acid in the temperature of 59°, and by sedative salt in that of boiling water or nearly so; but neither the arsenical nor aerial acids produce any.

Having prepared some hepar sulphuris with an over proportion of sulphur, an hepatic air was procured by means of concentrated vitriolic acid; but so loaded with sulphur, that it deposited some in the tube through which it was transmitted, and on the upper part of the glass receiver. On transferring it to another receiver, though then perfectly clear and transparent, in quantity about six cubic inches, yet next morning it was reduced to one inch, the inside of the glass being covered with a thick coat of sulphur; the small quantity of elastic fluid which remained being changed from hepatic to vitriolic air. "Hence (says Mr Kirwan) it appears, first, that a species of elastic fluid may exist in a state intermediate between the aerial and vaporous, which is not permanently elastic like air, nor immediately condensed by cold like vapour; but which, by the gradual loss of its specific heat, may be reduced to a concrete form. 2. That so large a quantity of sulphur may be combined with vitriolic air, as to enable it to exhibit the properties of hepatic air for some time at least. A mixture of three parts of pulverised quicklime and one of sulphur, heated to whiteness in a covered crucible for one hour, became of a stony hardness; and, being treated with marine acid, afforded hepatic air. On heating a piece of this stone in pure water, it becomes bluish; and hence the origin of blue marles generally found near hot sulphurated waters. A calcareous hepar may also be formed in the moist way."

Magnesia deprived of its fixed air, and heated in the same manner with sulphur, afforded no hepatic air. It was procured, however, from a mixture of three parts of iron-filings and one of sulphur melted together, and treated with marine acid. This sulphurated iron dissolved in marine acid affords almost entirely hepatic air, and very little of the inflammable kind. Equal parts of iron-filings and sulphur mixed together, and made into a paste with water, after heating and becoming black, afforded hepatic air when an acid was poured on it; but this was mixed with inflammable air, probably proceeding from uncombined iron. After a few days this mixture lost its power of producing hepatic air. Mr Bergman has also remarked, that combinations of sulphur with some other metals yield hepatic air.

Hepatic air was obtained by pouring some olive-oil upon a few grains of sulphur, and heating the mixture

Hepatic
Air.

in a vial with a bent tube. It was likewise obtained in great plenty from equal parts of sulphur and powdered charcoal, out of which the air had previously been expelled as much as possible: "yet (says our author) it is hardly possible to free charcoal wholly from foreign air, for it soon reattracts it when exposed to the atmosphere."

Six grains of pyrophorus mixed with alum and sugar effervesced with marine acid, and afforded two cubic inches and an half of hepatic air. This pyrophorus had been made six years before, and was kept in a tube hermetically sealed, and for several summers exposed to the light of the sun. It was so combustible, that some grains of it took fire while it was introduced into the vial out of which the hepatic air had been expelled.

A mixture of two parts of white sugar (previously melted in order to free it of water) with one part of sulphur, when heated to about 600 or 700 degrees, gave out hepatic air very rapidly. This air had a smell very much resembling that of onions, but contained neither fixed air nor any other acid. Sugar and sulphur melted together gave out no hepatic air when treated with acids. Water, spirit of wine, and marine acid, decompose this mixture, dissolving the sugar, and leaving the sulphur.

Twelve grains of sulphur heated in a retort, filled with metallic inflammable air, afforded no hepatic air; though the retort smelled of it when cold, and for some time after.

Eighteen grains of liver of sulphur exposed for four days to six cubic inches of fixed air, the thermometer at 70°, was somewhat whitened on the surface; the air not having an hepatic smell, but rather that of bread. It seemed to have taken up some sulphur, which was separated by lime-water. It was not in the least diminished; and therefore seems to have received an addition of hepatic air, or rather of sulphur.

On exposing a quantity of sulphureo-martial paste to fixed air for five days, the latter was not at all diminished, but received a slight addition of inflammable air. The paste itself, taken out of this air and exposed to the atmosphere, heated very strongly.

Three grains of sulphur exposed to twelve inches of marine air was not diminished in four days. On adding a cubic inch of water to this air, it was all absorbed to one inch, which had an hepatic smell, as had also the water, the latter evidently containing sulphur.

Hepatic air is found naturally in coal-pits, and has been discovered by Mr Bergman to be the principle on which the sulphureous properties of many mineral waters depend. There is also great reason to think that it is the peculiar production of the putrefaction of many, if not all, animal substances. Rotten eggs and corrupted water are known to emit this species of air, and also to discolour metallic substances, in the same manner. M. Viellard has lately discovered several other indications of this air in putrefied blood. In the 80th volume of Philosophical Transactions, p. 391. Dr Crawford gives an account of some experiments, from which it appears, that a kind of hepatic air is contained in the virus of cancers. Having obtained a portion of this ichor from a cancerous breast, he divided it into three parts, which were put into separate vials after being properly diluted with water. To one

of these he added some vegetable fixed alkali, to another a little concentrated vitriolic acid, and to the third some syrup of violets. No change was produced by the vegetable alkali; but on the addition of the acid, a deep brown colour was produced, and a brisk effervescence took place, at the same time that the peculiar odour of the cancerous matter was greatly augmented, and diffused itself to a considerable distance. A faint green colour was communicated to the third portion which had the syrup of violets.

As the cancerous matter on which these experiments were made had been previously kept some days, Dr Crawford suspected that it might thus have acquired its alkaline property; as Mr Geber has shown, that animal substances, when newly putrefied, do not contain any alkali. He repeated the experiment, therefore, on some matter recently procured from a cancerous penis. A manifest effervescence, though less than the foregoing, also took place in this case; the liquor acquired a brown colour, and the fetor increased. A portion of the same matter, diffused through distilled water, communicated a green colour as before; but in some cases the change was scarcely perceptible, though in all the experiments which were made the existence of an alkali one way or other was manifested.

The air extricated from the cancerous matter seemed by its smell to resemble rotten eggs more than any other species; but to investigate the matter fully, some portion of the virus was diffused through distilled water, the liquor filtered, and a small quantity of nitrous solution of silver dropped into it. An ash-coloured precipitate soon appeared diffused like a cloud through the liquid, and at the end of two hours the colour of the mixture was changed to a deep brown. The fetid smell was now rendered much fainter, and was entirely destroyed by an addition of concentrated nitrous acid, or by dephlogisticated spirit of salt; either of which substances would also have destroyed the smell of hepatic air.

On adding the vitriolic acid to common pus, no effervescence was produced, nor was the colour of the liquor changed, neither did any sensible precipitation take place for several hours. On repeating the experiment, however, with matter obtained from a venereal bubo, the liquid became slightly turbid on the addition of nitrated silver, and at the end of two hours it had acquired a brownish cast. The same effects took place with the matter which issued from a carious bone; but in both cases the precipitation was much less than with the cancerous matter.

To procure some quantity of the air in its separate state, a quantity of reddish cancerous matter was mixed with about thrice its weight of distilled water. On adding a little vitriolic acid to this mixture, an effervescence ensued, and the air was received in a vial over mercury. When one-half of the mercury was expelled from the vial, the latter was inverted over distilled water; and the portion of mercury that remained in it being suffered to descend, and the water to rise into its place, the vial was closely corked. The air and water were then briskly agitated together; and the vial being a second time inverted over distilled water, the cork was removed. It now appeared, by the height to which the water rose, that part of the air had been absorbed; and on dropping in a little nitrated

Hepatic
Air.

Hepatic
Air.

ted silver into it, a purplish cloud, inclining to red, was produced. In this experiment, the change of colour was at first scarcely perceptible, but became very distinct in a few minutes. The quantity of aerial fluid, however, which can thus be extricated by the addition of acid without heat is not very considerable: if heat be applied, a larger quantity of elastic fluid will be produced, having the smell of cancerous matter; but in that case it will be mixed with vitriolic acid air.

To obtain this air in as pure a state as possible, a portion of the cancerous virus, properly diluted with distilled water, was introduced into a small vial, a little vitriolic acid added, the vessel filled with distilled water, and a crooked tube also filled with water fitted to its neck. The extremity of the tube being then introduced into the neck of a bottle inverted in water, and the flame of a candle applied to the bottom of the vial, air began to rise in white bubbles, having a very fetid smell similar to that of cancerous matter; and the water impregnated with it occasioned a dark brown precipitate in a solution of nitrated silver. On separating the crooked tube from the vial, a very offensive white vapour, resembling in smell the air produced in the foregoing experiment, arose from the mixture, and continued to ascend for near half an hour. A portion of the liquor filtered, and mixed with a little concentrated nitrous acid, had its smell entirely destroyed; a slight effervescence being produced, and a flaky substance separated from the liquor and floating through it.

On examining the alkaline matter which had been separated from the cancerous virus, it was found, as had indeed been concluded *a priori*, to be the volatile alkali. It seemed probable that this alkali was united to the fixed air with which the cancerous matter was impregnated, because the peculiar smell of the matter was greatly augmented by the addition of the vitriolic acid; and this was confirmed by the following experiments.

1. A portion of cancerous matter was diffused through distilled water, and distilled in a small retort with a graduated heat until the bottom of the vessel became red hot. The common air, which first came over, was greatly impregnated with the smell of the cancerous matter: however, its qualities were not greatly impaired by the test of nitrous air; two measures of it, with one of nitrous air, occupying the space of little less than two measures. When the water began to boil, a large quantity of aqueous vapour arose; which, as soon as it came into contact with the air, produced a white smoke. The smell was now perceived to be similar to that of boiled animal substances; but no permanently elastic fluid was mixed with the aqueous vapour. When the greater part of the water was evaporated, the jar containing the first portion of air was removed, and the neck of the retort introduced beneath an inverted vessel filled with mercury. A considerable quantity of air smelling like burnt bones was now extricated, which was mixed with a yellow empyreumatic oil. On agitating some of it with water, part of the air was imbibed. Nitrated silver, dropped into the water thus impregnated, produced a reddish precipitate.

2. One measure of the air obtained in the foregoing

experiment was mixed with an equal quantity of alkaline air. In three hours the whole occupied only the bulk of one measure and two-tenths, and an oily scum was now left upon the inner surface of the tube; and in eight days the interior surface of the tube was covered with slender films of a yellowish colour spread irregularly upon it. The upper surface of the mercury within the tube was corroded; in some places having a reddish burnished appearance, in others it was changed into an ash-coloured powder interspersed with brown spots. On removing the tube from the mercury, the air that remained in it had a strong fetid smell, resembling that of burned bones.

3. To discover whether other animal substances yield an aerial fluid similar to that produced from the cancerous virus, a portion of the flesh of the neck of a chicken was distilled in a small coated glass-retort till it became red hot. A thin phlegm of a yellowish colour first came over: this was succeeded by a yellow empyreumatic oil; and at the same time a permanently elastic fluid, smelling like burned feathers, began to be disengaged. A slip of paper tinged with litmus, and reddened by acetous acid, being held over this fluid, presently became blue. The remainder of the air was very fetid, and highly inflammable. By agitation in water one half of it was absorbed; the remainder was inflammable, and burned first with a slight explosion, and afterwards with a blue lambent flame. On dropping a nitrous solution of silver into the water impregnated with this air, the mixture deposited a brown precipitate.

4. On treating putrid veal by distillation with a graduated heat, the products were found to be nearly similar to those already mentioned. The air obtained was highly inflammable, about one-half of it was absorbed by water; and the liquid thus impregnated let fall a brown precipitate on the addition of nitrous solution of silver. On adding some dephlogisticated marine acid to another portion of this liquor, a brisk effervescence took place, and a whitish gelatinous matter was separated: and this substance being evaporated to dryness, became black on the addition of the concentrated vitriolic acid. On agitation with water, part of the air was absorbed as in the former experiment, and the remainder burned with a lambent flame. This air, however, extricated from putrid veal, had less of an empyreumatic smell than that which was disengaged from fresh animal substances, being rather like that of putrefying animal matters.

From these experiments our author concludes, that the air extracted from animal substances consists of two distinct fluids, the one soluble and the other insoluble in water. The insoluble part burns with a lambent flame, and has all the characters of heavy inflammable air: but the soluble part resembles that which is produced from cancerous matter by the vitriolic acid; having a fetid odour, decomposing nitrated silver, combining with caustic volatile alkali, and possessing many of the properties of common hepatic air. In many particulars, however, the animal hepatic air differs from the common. The smell is considerably different, and in the decomposition of animal hepatic air no sulphur is separated, but a kind of flaky matter which is evidently an animal substance, as turning black by the vitriolic acid. The following experiment is a decisive

Hepatic
Air.

Hepatic
Air.

proof that no sulphur is contained in animal hepatic air. "Equal parts of pure air, and of air extricated from fresh beef by distillation, were fired by the electric shock in a strong glass tube over mercury. A little distilled water was then introduced through the mercury into the tube, and was agitated with the air which it contained. A portion of this water being filtered, and a small quantity of muriated barytes being dropped into it, the mixture remained perfectly transparent. Hence it appears, that the air extricated by distillation from fresh beef does not contain sulphur, as that substance would have been changed by burning into the vitriolic acid, and the muriated barytes would have been decomposed. The same experiment was frequently repeated with air extricated by distillation from the putrid as well as from the fresh muscular fibres of animals; but in no instance could the least vestige of vitriolic acid be discovered.

5. To analyse in a more perfect manner these kinds of animal airs, and to determine their products when combined with pure air, about an ounce of the lean of fresh mutton was exposed to a red heat in a small coated glass retort. Very near one half of the air produced towards the end was absorbed by water, and two-thirds of that which came over about the middle. A separate portion of the air, disengaged towards the end of the distillation, being allowed to remain over mercury for seven hours, it was found gradually to diminish in bulk; and a fluid, having the colour and smell of a thin empyreumatic oil, was collected at the bottom of the jar. This appearance, however, is not constant: the air, when placed over mercury, sometimes diminishes, and at other times retains its original bulk. Only one-eighth part of this air was absorbed by water. "Hence (says the Doctor) it appears, that a portion of the air extricated from animal substances by heat, resembles a species of hepatic air which was first discovered by Mr Kirwan, and which exists in an intermediate state between the aerial and the vaporous; this fluid not being permanently elastic like air, nor immediately condensed by cold like vapour, but gradually assuming the nonelastic form, in consequence probably of the tendency of its several parts to unite with one another."

6. To determine the proportion of fixed air contained in that produced from the lean of animal substances, a quantity of air extracted from mutton was received over mercury in a large vial with a narrow neck. When the vial was little more than half filled, the remaining portion of the mercury was displaced by introducing water that had been previously boiled. The vial being then closely corked, the air and water were briskly agitated together; and the liquor, thus impregnated with the soluble part of the animal air, was put into a vial to the bottom of which heat was applied. Thus a part of the air was again disengaged, and received in a tube inverted over mercury; and the process continued till the liquor no longer rendered lime-water turbid. On agitating the air a second time with water, and comparing the bulk after agitation with that before it, it appeared that the quantity absorbed was about one-fourth part. From this experiment also it appeared, that animal hepatic air, when once absorbed by water, is not capable of being again disengaged by a boiling heat; for after the fixed air

had all been expelled, the liquor was made to boil nearly for half an hour, but no permanently elastic fluid could be disengaged: that portion of the liquor which remained had a faint yellow colour, and smelled strongly of animal hepatic air, depositing also a brown precipitate upon the addition of nitrated silver. "It appears therefore (says the Doctor), that the soluble part of the air disengaged from animal substances by heat, consists of three distinct fluids; of alkaline air, fixed, and animal hepatic air. It seemed extremely probable, that these three aerial fluids, slowly combining together, formed the oily empyreumatic substance which was collected at the bottom of the jar, while the air was undergoing the diminution described above. In this conclusion I was confirmed by trials that were made with the empyreumatic oil that came over in the latter part of the distillation: for when it was examined by chemical tests soon after it was obtained, it was found to contain fixed air, volatile alkali, and animal hepatic air."

7. To determine the products resulting from the combustion of pure air with the animal hepatic air, one portion of the air extracted from the lean of mutton was agitated with water, the other was not. One measure of the former was introduced over mercury into a strong glass tube, and then mixed with one measure and an half of pure air. A small shock being made to pass through it, a violent explosion took place; and the space occupied by the air in the tube was reduced from an inch and two-tenths to nine-tenths of an inch. On agitating the residuum with water, six-tenths were absorbed; and the portion absorbed appeared to be fixed air by its precipitating lime-water. Five parts of nitrous air being mixed with an equal quantity of the insoluble residuum, a diminution of three parts took place; whence it appears that one-fifth of the insoluble residuum was pure air. Hence it appears that fixed air was produced by the inflammation of dephlogisticated and animal hepatic air.

8. One measure of that portion of animal air which had not been agitated with water was mixed with a measure and an half of pure air, and fired by the electric shock. Previous to the deflagration, the two airs occupied the space of 1.15 inches, but afterwards it was reduced to 1.1. On agitation with water, about one-third was absorbed; a portion of the insoluble residuum burned with a faint blue flame.

9. As it appeared from these experiments, that a measure and an half of dephlogisticated air was not sufficient to saturate one of the animal air that had not been agitated with water, the experiment was repeated in the following manner. Two parts of pure air, with one of the animal kind, occupied the space of eight-tenths of an inch; but when fired by the electric shock, the residuum stood at a little less than half an inch; and this residuum was almost wholly absorbed on agitation with lime-water. By a subsequent trial it was found, that nearly one-half of the animal air used in this experiment was soluble in water. When equal parts of pure and animal air were burned together, a considerable increase of bulk almost invariably took place; and when the animal was to the pure air as 21 to 15, the bulk of the mixture was increased one half. The residuum of the air was inflammable.

10. To investigate the cause of this augmentation of

Hepatic
Air.

Hepatic
Air.

of bulk, three measures of animal were mixed with two of pure air; and several strong electric shocks were made to pass through the mixture, but without being able to set it on fire. On adding half a measure more of pure air, it took fire; and the bulk was augmented from .9 to 1.3 inches. Three measures of the residuum were then mixed with three of pure air, and the mixture fired by the electric shock; the bulk of the mixture being reduced from one inch to .56. On agitation with lime-water, two-thirds were absorbed, and the remainder consisted almost entirely of pure air.

11. Having accidentally taken two or three small shocks through some alkaline air, and not observing any sensible increase of bulk, the Doctor mixed it with an equal quantity of pure air, not apprehending that any decomposition had taken place. Contrary to expectation, however, the two fluids entered rapidly into combination with each other the moment that the electric shock was made to pass through them. The jar, which he held loosely in his hand, as it was inverted over the jar, was carried obliquely upward with great violence; the stand of the prime conductor was broken, and the cylinder shivered into a thousand pieces. The experiment, however, was afterwards safely repeated with a very strong apparatus; the jar being pressed down with a plate of iron for the purpose of retaining it in its place.

"It appeared (says the Doctor), that when the alkaline and pure air were immediately mixed together, and a small shock was made to pass through them, they would not take fire; but when three or four shocks were previously taken through the alkaline air, and the latter was afterwards mixed with an equal quantity of pure air, they exploded with great violence. One-sixth of the residuum was alkaline, the remainder phlogisticated air."

Several other experiments are related by the Doctor in this paper, which tend to show that animal hepatic air is extricated in large quantity by the process of putrefaction. By distilling a green cabbage leaf, he also obtained an aerial fluid, in most of its properties resembling animal hepatic air. The fetid smell of this gas is destroyed by suffering it to remain in contact with pure air for several weeks; and so effectually by the vapour of dephlogisticated marine acid, that he was induced to try the efficacy of this fluid as an application to cancers. In some cases it appeared to be of service, though some ulcerated cancers were found so irritable, that they could bear no application whatever. The liquid itself appears to be unsafe when taken inwardly. Dr Crawford having taken 20 drops of it largely diluted with water, found himself affected with an obtuse pain and sense of constriction in his stomach and bowels, which resisted the use of emetics and laxatives, but yielded to sulphureous water. He found afterwards, that the manganese which had been used in the distillation of the acid, contained a small quantity of lead. He relates also, on the authority of Dr Ingenhousz, that a Dutchman of his acquaintance some time ago drank a considerable quantity of the dephlogisticated marine acid; the effects it produced were so violent, that he narrowly escaped with his life. These deleterious qualities our author ascribes to lead; though it can by no means be proved that manganese

is more innocent: and it is also exceedingly probable that some of this semimetal rises in the preparation of what is called the *dephlogisticated* or *oxygenated* marine acid.

HEPATIC Aloes, the inspissated juice of a species of *ALOE*.

HEPATIC Stone. See *LIVER Stone*.

HEPATIC Water. See *HEPAR Sulphuris*.

HEPATICA, in botany, a species of *ANEMONE*.

HEPATITIS, in medicine, an inflammation of the liver. See *MEDICINE-Index*.

HEPATOSCOPIA (formed of *ηπαρ liver*, and *σκοπία I consider*), in antiquity, a species of divination, wherein predictions were made by inspecting the livers of animals.

HEPATOSCOPIA is also used as a general name for divination by intrails.

HEPHÆSTIA, in Grecian antiquity, an Athenian festival in honour of Vulcan, the chief ceremony of which was a race with torches. It was performed in this manner: The antagonists were three young men, one of whom, by lot, took a lighted torch in his hand, and began his course; if the torch was extinguished before he finished the race, he delivered it to the second; and he in like manner to the third: the victory was his who first carried the torch lighted to the end of the race; and to this successive delivering of the torch we find many allusions in ancient writers.

HEPHTHEMIMERIS (composed of *επτα seven*, *ημισ half*, and *μερ part*), in the Greek and Latin poetry, a sort of verse consisting of three feet and a syllable; that is, of seven half feet.

Such are most of the verses in Anacreon:

Θαλω	λεγειν	Ατρε	δασ
Θαλω	δε Καδ	μον α	διν, &c.

And that of Aristophanes, in his *Plutus*:

Επισθε μετρι χοιροι.

They are also called *trimetri catalexici*.

HEPHTHEMIMERIS, or *Hephtthemimeres*, is also a cæsuræ after the third foot; that is, on the seventh half-foot. It is a rule, that this syllable, though it be short in itself, must be made long on account of the cæsuræ, or to make it an *hephtthemimeris*. As in that verse of Virgil.

Et furis agitatæ amor, et conscia virtus.

It may be added, that the cæsuræ is not to be on the fifth foot, as it is in the verse which Dr Harris gives us for an example:

Ille latus nixum molli fultus Hyacintho

This is not a *hephtthemimeris* cæsuræ, but a *henneamimeris*, i. e. of nine half feet.

HEPTACHORD, in the ancient poetry, signified verses that were sung or played on seven chords, that is, on seven different notes. In this sense it was applied to the lyre when it had but seven strings. One of the intervals is also called an *heptachord*, as containing the same number of degrees between the extremes.

HEPTAGON, in geometry, a figure consisting of seven sides, and as many angles. In fortification, a place is termed an *heptagon*, that has seven bastions for its defence.

HEPTAGONAL NUMBERS, in arithmetic, a sort of polygonal numbers, wherein the difference of the terms of the corresponding arithmetical progression is

Hepatica
||
Heptagonal.

Heptandria
||
Heracleo-
nites.

5. One of the properties of these numbers is, that if they be multiplied by 40, and 9 be added to the product, the sum will be a square number.

HEPTANDRIA, in botany (from *ἑπτα* *septem*, and *ανης a man*); the seventh class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which have seven stamina or male-organs. The orders are four, derived from the number of styles or female-organs.

HEPTANGULAR, in geometry, an appellation given to figures which have seven angles.

HEPTARCHY (compounded of the Greek *ἑπτα*, "seven," and *αρχη*, *imperium*, "government"), a government composed of seven persons, or a country governed by seven persons, or divided into seven kingdoms.

The Saxon heptarchy included all England, which was cantoned out into seven petty independent kingdoms, peopled and governed by different clans and colonies; viz. those of Kent, the South Saxons, West Saxons, East Saxons, Northumberland, the East Angles, and Mercia. The heptarchy was formed by degrees from the year 455, when first the kingdom of Kent was erected, and Hengist assumed the title of king of Kent immediately after the battle of Eglesford; and it terminated in 827 or 828, when king Egbert reunited them into one, made the heptarchy into a monarchy, and assumed the title of king of England. It must be observed, however, that though Egbert became monarch of England, he was not perfectly absolute. The kingdom which he actually possessed consisted of the ancient kingdoms of Wessex, Suffex, Kent, and Essex, that had been peopled by Saxons and Jutes. As for the other three kingdoms, whose inhabitants were Angles, he contented himself with preserving the sovereignty over them, permitting them to be governed by kings who were his vassals and tributaries.

The government of the heptarchy, reckoning from the founding of the kingdom of Mercia, the last of the seven Anglo-Saxon kingdoms, lasted 243 years; but if the time spent by the Saxons in their conquests from the arrival of Hengist in 449 be added, the heptarchy will be found to have lasted 378 years from its commencement to its dissolution. The causes of the dissolution of the heptarchy were the great inequality among the seven kingdoms, three of which greatly surpassed the others in extent and power; the default of male heirs in the royal families of all the kingdoms, that of Wessex excepted; and the concurrence of various circumstances which combined in the time of Egbert.

HERACLEA, an ancient city of Turkey in Europe, and in Romania, with the see of an archbishop of the Grecian church, and a sea-port. It was a very famous place in former times, and there are still some remains of its ancient splendor. Theodore Lascaris took it from David Comnenus, emperor of Trebisond; when it fell into the hands of the Genoese, but Mahomet II. took it from them; since which time it has been in the possession of the Turks. It is near the sea. E. Long. 27 48. N. Lat. 40. 27.

HERACLEONITES, a sect of Christians, the followers of Heracleon, who refined upon the Gnostic divinity, and maintained that the world was not the immediate production of the son of God, but that he was only the occasional cause of its being created by

the demiurgus. The Heracleonites denied the authority of the prophecies of the Old Testament, maintaining that they were mere random sounds in the air; and that St John the Baptist was the only true voice that directed to the Messiah.

HERACLEUM, MADNESS: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellata*. The fruit is elliptical, emarginated, compressed, and striated, with a thin border. The corolla is difform, inflexed, and emarginated; the involucre dropping off. There are five species, of which the most remarkable is the spondylium, or cow-parsnip. This is common in many parts of Britain, and other northern parts of Europe and Asia.—Gmelin, in his *Flora Siberica*, p. 214. tells us, that the inhabitants of Kamtschatka, about the beginning of July, collect the foot-stalks of the radical leaves of this plant, and, after peeling off the rhind, dry them separately in the sun, and then, tying them in bundles, dry them carefully in the shade: in a short time afterwards, these dried stalks are covered over with a yellow saccharine efflorescence, tasting like liquorice: and in this state they are eaten as a great delicacy.—The Russians not only eat the stalks thus prepared, but procure from them a very intoxicating spirit. They first ferment them in water with the greater bilberries (*vaccinium uliginosum*), and then distil the liquor to what degree of strength they please; which Gmelin says is more agreeable to the taste than spirits made from corn. This may therefore prove a good succedaneum for whisky, and prevent the consumption of much barley, which ought to be applied to better purposes.—Swine and rabbits are very fond of this plant. In the county of Norfolk it is called *hog-weed*.

HERACLIDÆ, the descendants of Hercules, greatly celebrated in ancient history. Hercules at his death left to his son Hyllus all the rights and demands which he had upon the Peloponnesus, and permitted him to marry Iole as soon as he came of age. The posterity of Hercules were not more kindly treated by Euristheus than their father had been, and they were obliged to retire for protection to the court of Ceyx, king of Trachinia. Euristheus pursued them thither; and Ceyx, afraid of his resentment, begged the Heraclidæ to depart from his dominions. From Trachinia they came to Athens, where Theseus the king of the country, who had accompanied their father in some of his expeditions, received them with great humanity, and assisted them against their common enemy Euristheus. Euristheus was killed by the hand of Hyllus himself, and his children perished with him, and all the cities of the Peloponnesus became the undisputed property of the Heraclidæ. Their triumph, however, was short; their numbers were lessened by a pestilence; and the oracle informed them, that they had taken possession of the Peloponnesus before the gods permitted their return. Upon this they abandoned Peloponnesus, and came to settle in the territories of the Athenians, where Hyllus, obedient to his father's commands, married Iole the daughter of Eurytus. Soon after he consulted the oracle, anxious to recover the Peloponnesus; and the ambiguity of the answer determined him to make a second attempt. He challenged to single combat Atreus, the successor of Euristheus on the throne of Mycenæ;

Heraclides, Heraclitus. cenæ; and it was mutually agreed that the undisturbed possession of the Peloponnesus should be ceded to whoever defeated his adversary. Echemus accepted the challenge for Atreus, and Hyllus was killed, and the Heraclidæ a second time departed from Peloponnesus. Cleodæus the son of Hyllus made a third attempt, and was equally unsuccessful; and his son Aristomachus some time after met with the same unfavourable reception, and perished in the field of battle. Aristodemus, Temenus, and Chresphontes, the three sons of Aristomachus, encouraged by the more expressive word of an oracle, and desirous to revenge the death of their progenitors, assembled a numerous force, and with a fleet invaded all Peloponnesus. Their expedition was attended with much success; and after some decisive battles, they became masters of all the peninsula. The recovery of the Peloponnesus by the descendants of Hercules forms an interesting epoch in ancient history, which is universally believed to have happened 80 years after the Trojan war, or 1190 years before the Christian era. This conquest was totally achieved about 120 years after the first attempt of Hyllus, who was killed about 20 years before the Trojan war. As it occasioned a world of changes and revolutions in the affairs of Greece, inasmuch that scarce a state or people but were turned upside down thereby, the return of the Heraclidæ is the epocha of the beginning of profane history: all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanus, Calisthenes, and Theopompus, only begin their histories from hence.

HERACLIDES of PONTUS, a Greek philosopher, the disciple of Speusippus, and afterwards of Aristotle, flourished about 336 B. C. His vanity prompted him to desire one of his friends to put a serpent into his bed just as he was dead, in order to raise a belief that he was ascended to the heavens among the gods; but the cheat was discovered. All his works are lost.

HERACLITUS, a famous Ephesian philosopher, who flourished about the 69th Olympiad, in the time of Darius Hystaspes. He is said to have continually bewailed the wicked lives of men, and, as often as he came among them, to have fallen a-weeping; contrary to Democritus, who made the follies of mankind a subject of laughter. He retired to the temple of Diana, and played at dice with the boys there; saying to the Ephesians who gathered round him, "Worst of men, what do ye wonder at? Is it not better to do thus than to govern you?" Darius wrote to this philosopher to come and live with him; but he refused the offer: at last, out of hatred to mankind, he retired to the mountains, where he contracted a dropsy by living on herbs, which destroyed him at 60 years of age. His writings gained him so great reputation, that his followers were called *Heraclitians*. Laertius speaks of a treatise upon nature, divided into three books, one con-

cerning the universe, the second political, the third theological. This book he deposited in the temple of Diana; and it is said, that he affected to write obscurely, lest it should be read by the vulgar, and become contemptible. The fundamental doctrine of his philosophy was, that fire is the principle of all things; and the ancient philosophers have collected and preserved admirable apophthegms of this philosopher.

HERACLIUS, emperor of the east, a renowned warrior, died A. D. 641. He carried on long and bloody wars with the Saracens, by whom he was almost always defeated. See ARABIA, n° 67—93.

HERALD, says Verstegan, is derived from the Saxon word *Herebault*, and by abbreviation *Heralt*, which in that language signifies the champion of an army; and, growing to be a name of office, it was given to him who, in the army, had the special charge to denounce war, to challenge to battle and combat, to proclaim peace, and to execute martial messages. But the business of heralds with us is as follows, viz. To marshal, order, and conduct all royal cavalcades, ceremonies at coronations, royal marriages, installations, creations of dukes, marquises, earls, viscounts, barons, baronets, and dubbing of knights; embassies, funeral processions, declarations of war, proclamations of peace, &c.: To record and blazon the arms of the nobility and gentry; and to regulate any abuses therein through the English dominions, under the authority of the Earl Marshal, to whom they are subservient. The office of Windsor, Chester, Richmond, Somerset, York, and Lancaster heralds, is to be assistants to the kings at arms, in the different branches of their office; and they are superior to each other, according to creation, in the above order.

Heralds were formerly held in much greater esteem than they are at present; and were created and christened by the king, who, pouring a gold-cup of wine on their head, gave them the herald-name: but this is now done by the earl-marshal. They could not arrive at the dignity of herald without having been seven years pursuivant; nor could they quit the office of herald, but to be made king at arms.

Richard III. was the first who formed them, in this kingdom, into a college; and afterwards great privileges were granted them by Edward VI. and Philip and Mary.

The origin of heralds is very ancient. Stentor is represented by Homer as herald of the Greeks, who had a voice louder than 50 men together. The Greeks called them *κρυκτες*, and *εμπυλακτες*; and the Romans, *feciales*. The Romans had a college of heralds, appointed to decide whether a war were just or unjust; and to prevent its coming to open hostilities, till all means had been attempted for deciding the difference in a pacific way.

H E R A L D R Y,

A SCIENCE which teaches how to blazon, or explain in proper terms, all that belongs to coats-of-arms; and how to marshal, or dispose regularly, divers arms on a field. It also teaches whatever relates to the

marshalling of solemn cavalcades, processions, and other public ceremonies at coronations, installations, creations of peers, nuptials, christening of princes, funerals, &c.

Arms,

Definition,
origin, &c.
of Heraldry.

Arms, or coats-of-arms, are hereditary marks of honour, made up of fixed and determined colours and figures, granted by sovereign princes, as a reward for military valour, a shining virtue, or a signal public service; and which serve to denote the descent and alliance of the bearer, or to distinguish states, cities, societies, &c. civil, ecclesiastical, and military.

Thus heraldry is the science, of which *arms* are the proper object; but yet they differ much both in their origin and antiquity. Heraldry, according to Sir George Mackenzie, "as digested into an art, and subjected to rules, must be ascribed to Charlemagne and Frederick Barbarossa, for it did begin and grow with the feudal law." Sir John Ferne is of opinion, that we did borrow *arms* from the Egyptians; meaning, from their hieroglyphicks. Sir William Dugdale mentions, that arms, as marks of honour, were first used by great commanders in war, necessity requiring that their persons should be notified to their friends and followers. The learned Alexander Nisbet, in his excellent system of heraldry, says, that arms owe their rise and beginning to the light of nature, and that signs and marks of honour were made use of in the first ages of the world, and by all nations, however simple and illiterate, to distinguish the noble from the ignoble. We find in Homer, Virgil, and Ovid, that their heroes had divers figures on their shields, whereby their persons were distinctly known. Alexander the Great, desirous to honour those of his captains and soldiers who had done any glorious action, and also to excite an emulation among the rest, did grant them certain badges to be borne on their armour, pennons, and banners; ordering, at the same time, that no person or potentate, through his empire, should attempt or presume to give or tolerate the bearing of those signs upon the armour of any man, but it should be a power reserved to himself; which prerogative has been claimed ever since by all other kings and sovereign princes within their dominions.

After these and many other different opinions, all that can be said with any certainty is, that, in all ages, men have made use of figures of living creatures, or symbolical signs, to denote the bravery and courage either of their chief or nation, to render themselves the more terrible to their enemies, and even to distinguish themselves or families, as names do individuals. The famous C. Agrippa, in his treatise of the vanity of sciences, cap. 81. has collected many instances of these marks of distinction, anciently borne by kingdoms and states that were any way civilized, viz.

The Egyptians	} bore	an Ox,
The Athenians		an Owl,
The Goths		a Bear,
The Romans		an Eagle,
The Franks		a Lion,
The Saxons		a Horse.

The last is still borne in the arms of his present Britannic Majesty. As to hereditary arms of families, William Camden, Sir Henry Spelman, and other judicious heralds, agree, that they began no sooner than towards the latter end of the 11th century. According to Father Menestrier's opinion, a French writer whose authority is of great weight in this matter, Henry l'Oiseleur (the Falconer) who was raised
N^o 151.

to the imperial throne of the West in 920, by regulating tournaments in Germany gave occasion to the establishment of family-arms, or hereditary marks of honour, which undeniably are more ancient and better observed among the Germans than in any other nation. Moreover, this last author asserts, that with tournaments first came up coats-of-arms; which were a sort of livery, made up of several lists, fillets, or narrow pieces of stuff of divers colours, from whence came the fess, the bend, the pale, &c. which were the original charges of family-arms; for they who never had been at tournaments, had not such marks of distinction. They who insisted themselves in the Croisades, took up also several new figures hitherto unknown in armorial ensigns; such as alerions, bezants, escalop-shells, martlets, &c. but more particularly crosses, of different colours for distinction's sake. From this it may be concluded, that heraldry, like most human inventions, was insensibly introduced and established; and that, after having been rude and unsettled for many ages, it was at last methodised, perfected, and fixed, by the Croisades and tournaments.

These marks of honour are called *arms*, from their being principally and first worn by military men at war and tournaments, who had them engraved, embossed, or depicted on shields, targets, banners, or other martial instruments. They are also called *coats-of-arms*, from the custom of the ancients embroidering them on the coats they wore over their arms, as heralds do to this day.

Arms are distinguished by different names, to denote the causes of their bearing; such as,

A R M S	
Of Dominion,	Of Patronage,
Of Pretension,	Of Family,
Of Concession,	Of Alliance,
Of Community,	Of Succession.

Arms of *dominion* or sovereignty are those which emperors, kings, and sovereign states, do constantly bear; being, as it were, annexed to the territories, kingdoms, and provinces, they possess. Thus the three lions are the arms of England, the fleurs-de-lis those of France, &c.

Arms of *pretension* are those of such kingdoms, provinces, or territories, to which a prince or lord has some claim, and which he adds to his own, although the said kingdoms or territories be possessed by a foreign prince or other lord. Thus the kings of England have quartered the arms of France with their own, ever since Edward III. laid claim to the kingdom of France, which happened in the year 1330, on account of his being son to Isabella, sister to Charles the Handsome, who died without issue.

Arms of *concession* or augmentation of honour, are either entire arms, or else one or more figures, given by princes as a reward for some extraordinary service. We read in history, that Robert Bruce, king of Scotland, allowed the earl of Winton's ancestor to bear, in his coat-armour, a crown supported by a sword, to show that he, and the clan Seaton, of which he was the head, supported his tottering crown. The late Queen Anne granted to Sir Cloudesly Shovel, rear-admiral of Great Britain, a chevron between two fleurs-de-lis in chief, and a crescent in base, to denote
three

ESCUTCHEONS.

Fig. 2.

TINCTURES.

Of the Shield, &c. three great victories he had gained; two over the French, and one over the Turks.

Arms of *community*, are those of bishoprics, cities, universities, academies, societies, companies, and other bodies corporate.

Arms of *patronage*, are such as governors of provinces, lords of manors, patrons of benefices, &c. add to their family-arms, as a token of their superiority, rights, and jurisdiction. These arms have introduced into heraldry, castles, gates, wheels, ploughs, rakes, harrows, &c.

Arms of *family*, or *paternal arms*, are those that belong to one particular family, that distinguish it from others, and which no person is suffered to assume without committing a crime, which sovereigns have a right to restrain and punish.

Arms of *alliance*, are those which families, or private persons, take up and join to their own, to denote the alliances they have contracted by marriage. This sort of arms is either impaled, or borne in an *escutcheon of pretence*, by those who have married heiresses.

Arms of *succession*, are such as are taken up by them who inherit certain estates, manors, &c. either by will, entail, or donation, and which they either impale or quarter with their own arms; which multiplies the titles of some families out of necessity, and not through ostentation, as many imagine.

These are the eight classes under which the divers sorts of arms are generally ranged; but there is a sort which blazoners call *assumptive arms*, being such as are taken up by the caprice or fancy of upstarts, though of ever so mean extraction, who, being advanced to a degree of fortune, assume them without a legal title. This, indeed, is a great abuse of heraldry; and common only in Britain, for on the continent no such practice takes place.

We now proceed to consider the essential and integral parts of arms, which are these:

The ESCUTCHEON, The CHARGES,
The TINCTURES, The ORNAMENTS.

C H A P. I.

Of the SHIELD or ESCUTCHEON.

THE *Shield* or *Escutcheon* is the field or ground whereon are represented the figures that make up a coat of arms: for these marks of distinction were put on bucklers or shields before they were placed on banners, standards, flags, and coat-armour; and wherever they may be fixed, they are still on a plane or superficies whose form resembles a shield.

Shields, in heraldry called *escutcheons* or *scutcheons*, from the Latin word *scutum*, have been, and still are, of different forms, according to different times and nations. Amongst ancient shields, some were almost like a horse-shoe, such as is represented by n° 1. in the figure of Escutcheons; others triangular, somewhat rounded at the bottom, as n° 2. The people who inhabited Mesopotamia, now called *Diarbeck*, made use of this sort of shield, which it is thought they had of the Trojans. Sometimes the shield was heptagonal, that is, had seven sides, as n° 3. The first of this shape is said to have been used by the famous triumvir M. Antony. That of knights-banneret was square, like a banner, as n° 4. As to modern escutcheons, those of

Plate
CCXXVII.

the Italians, particularly of ecclesiastics, are generally oval, as n° 5. The English, French, Germans, and other nations, have their escutcheons formed different ways, according to the carver's or painter's fancy: see the various examples contained from n° 6—16 of the figure. But the escutcheon of maids, widows, and of such as are born ladies, and are married to private gentlemen, is of the form in a lozenge: See n° 17—20. Sir George Mackenzie mentions one Muriel, countess of Strathern, who carried her arms in a lozenge, anno 1284, which shows how long we have been versant in heraldry.

Armorists distinguish several parts or points in escutcheons, in order to determine exactly the position of the bearings they are charged with; they are here denoted by the first nine letters of the alphabet, ranged in the following manner:

A—the dexter chief.
B—the precise middle chief.
C—the sinister chief.
D—the honour point.
E—the fess point.
F—the nombril point.
G—the dexter base.
H—the precise middle base.
I—the sinister base.

The knowledge of these points is of great importance, and ought to be well observed, for they are frequently occupied with several things of different kinds. It is necessary to observe, that the dexter side of the escutcheon is opposite to the left hand, and the sinister side to the right hand of the person that looks on it.

C H A P. II.

Of TINCTURES, FURS, LINES, and DIFFERENCES.

SECT. I. Of Tinctures.

By *tinctures* is meant, that variable hue of arms which is common both to shields and their bearings. According to the French heralds, there are but seven tinctures in armory; of which two are metals, the other five are colours.

The Metals are,

Gold, } termed { Or.
Silver, } { Argent.

The Colours are

Blue, } termed { Azure.
Red, } { Gules.
Green, } { Vert.
Purple, } { Purpure.
Black, } { Sable.

When natural bodies, such as animals, plants, celestial bodies, &c. are introduced into coats of arms, they frequently retain their natural colours, which is expressed in this science by the word *proper*.

Besides the five colours above mentioned, the English writers on heraldry admit two others, viz.

Orange, } termed { Tenny.
Blood-colour, } { Sanguine.

But these two are rarely to be found in British bearings.

These tinctures are represented in engravings and drawings

The
Tinctures.

drawings (the invention of the ingenious Silvester Petra Sancta, an Italian author of the last century) by dots and lines, as in fig. ii. n^o 1—9.

Or is expressed by dots.

Argent needs no mark, and is therefore plain.

Azure, by horizontal lines.

Gules, by perpendicular lines.

Vert, by diagonal lines from the dexter chief to the sinister base points.

Purple, by diagonal lines from the sinister chief to the dexter base points.

Sable, by perpendicular and horizontal lines crossing each other.

Tenny, by diagonal lines from the sinister chief to the dexter base points, traversed by horizontal lines.

Sanguine, by lines crossing each other diagonally from dexter to sinister, and from sinister to dexter.

Sir George M'Kenzie observes, that "some fantastic heralds have blazoned not only by the ordinary colours and metals, but by flowers, days of the week, parts of a man's body, &c. and have been condemned for it by the heralds of all nations. Yet the English have so far owned this fancy," (the most judicious of them, as Mr Cartwright and others, reprobate it as absurd), "that they give it for a rule, that the coats of sovereigns should be blazoned by the planets, those of noblemen by precious stones; and have suited them in the manner here set down:

Or	Topaz	Sol.
Argent	Pearl	Luna.
Sable	Diamond	Saturn.
Gules	Ruby	Mars.
Azure	Sapphire	Jupiter.
Vert	Emerald	Venus.
Purple	Amethyst	Mercury.
Tenny	Jacinth	Dragon's-head.
Sanguine	Sardonix	Dragon's-tail.

"But I crave leave to say, that these are but mere fancies; and are likewise unfit for the art, for these reasons: 1st, The French (from whom the English derive their heraldry, not only in principles, but in words of the French language) do not only not use these different ways of blazoning, but treat them *en ridicule*. 2dly, The Italian, Spanish, and Latin heralds use no such different forms, but blazon by the ordinary metals and colours. 3dly, Art should imitate nature; and as it would be an unnatural thing in common discourse not to call red *red* because a prince wears it, so it is unnatural to use these terms in heraldry. And it may fall out to be very ridiculous in some arms: for instance, if a prince had for his arms an *afs couchant* under his burden *gules*, how ridiculous would it be to say he had an *afs couchant Mars*?—A hundred other examples might be given; but it is enough to say, that this is to confound colours with charges, and the things that are borne with colours. 4thly, It makes the art unpleasant, and deters gentlemen from studying it, and strangers from understanding what our heraldry is; nor could the arms of our princes and nobility be translated in this disguise into Latin or any other language. But that which convinces most that this is an error is, because it makes that great rule unnecessary, whereby colour cannot be

put upon colour, nor metal upon metal; but this cannot hold but where metals and colours are expressed." The Furs.

The English heralds give different names to the roundlet (n^o 10), according to its colour. Thus, if it is

Or,	} it is called a {	<i>Bezant.</i>
Argent,		<i>Plate.</i>
Azure,		<i>Hurt.</i>
Gules,		<i>Torteau.</i>
Vert,		<i>Pomey.</i>
Purple,		<i>Golpe.</i>
Sable,		<i>Pellet.</i>
Tenny,		<i>Orange.</i>
Sanguine,		<i>Guze.</i>

The French, and all other nations, do not admit such a multiplicity of names to this figure; but call them *Bezants*, after an ancient coin struck at Constantinople, once *Byzantium*, if they are Or and Torteaux; if of any other tincture, expressing the same.

SECT. II. Of Furs.

FURS represent the hairy skin of certain beasts, prepared for the doublings or linings of robes and garments of state: and as shields were anciently covered with furred skins, they are therefore used in heraldry not only for the linings of the mantles, and other ornaments of the shields, but also in the coats of arms themselves.

There are three different kinds in general use, viz.

1. *Ermine*; which is a field argent, powdered with black spots, their tails terminating in three hairs. (Fig. ii. n^o 11.)

2. *Counter-ermine*, where the field is sable, and the powdering white. (n^o 12.)

3. *Vair* (n^o 15.), which is expressed by blue and white skins, cut into the forms of little bells, ranged in rows opposite to each other, the base of the white ones being always next to that of the blue ones. *Vair* is usually of six rows; if there be more or fewer, the number ought to be expressed; and if the colours are different from those above mentioned, they must likewise be expressed.

The English multiply the furs, as well as the names of the tinctures, though no other nation has adopted such varieties. Thus they give us,

1. *White*, which is the natural colour of the ermine; but it is used on no other occasion but in the descriptions of mantles.

2. *Ermines*, which is the same with contra-ermine.

3. *Erminois*; the field is Or, the powdering Sable, (n^o 13.) For the use of this fur Guillim cites Bara, p. 14. but no such fur is to be found in Bara.

4. *Pean*; the field is Sable, the powdering Or, (n^o 14.) The French use no such term: but they call all furs or doublings *des pannes*, or *pennes*; which term has possibly given rise to this mistake, and many others, in those who do not understand the French language.

5. *Erminites*; the same as Ermine, with the addition of a red hair on each side of the black. Sir Geo. M'Kenzie calls these distinctions "but fancies, for *erminites* signifies properly *little ermines*."

6. *Counter-vair*; when the bells of the same tincture are

Of Lines. are placed base against base, and point against point, (n^o 16.)

7. *Potent-counter-potent*, anciently called *Vairy-cuppy*, as when the field is filled with crutches or potents counter-placed, (n^o 17.)

It may not be improper to observe, that the use of the tinctures took its rise from the several colours used by warriors whilst they were in the army, which S. de Petra Sancta proves by many citations. And because it was the custom to embroider gold and silver on silk, or silk on cloth of gold and silver, the heralds did therefore appoint, that in imitation of the clothes so embroidered, colour should never be used upon colour, nor metal upon metal.

SECT. III. Of the Lines used in the parting of Fields.

ESCUTCHEONS are either of one tincture, or more than one. Those that are of one only, that is, when some metal, colour, or fur, is spread all over the surface or field, such a tincture is said to be predominant: but in such as have on them more than one, as most have, the field is divided by lines; which, according to their divers forms, receive various names.

Lines may be either straight or crooked. Straight lines are carried evenly through the escutcheon: and are of four different kinds; viz. a perpendicular line |; a horizontal, —; a diagonal dexter, \; a diagonal sinister, /.

Crooked lines are those which are carried unevenly through the escutcheon with rising and falling. French armorists reckon 11 different sorts of them; Guillim admits of seven only; but there are 14 distinct kinds, the figures and names of which are as in fig. i. (A), n^o 1—14. viz.

1. The engrailed. 2. The invected. 3. The wavy. 4. The embattled, or crenelle. 5. The nebule. 6. The raguly. 7. The indented. 8. The dancette. 9. The dove-tail. 10. The grafted. 11. The embattled a-ronde. 12. The battled embattled. 13. The patee or dove-tail. 14. Champaine.

The principal reason why lines are thus used in heraldry, is to difference bearings which would be otherwise the same; for an escutcheon charged with a chief engrailed, differs from one charged with a chief wavy, as much as if the one bore a cross and the other a saltier.

As the forementioned lines serve to divide the field, it must be observed, that if the division consists of two equal parts made by the perpendicular line, it is called *parted per pale*; by the horizontal line, *parted per fess*; by the diagonal dexter, *parted per bend*; by the diagonal sinister, *parted per bend sinister*; examples of which will be given in the sequel of this treatise.

If a field is divided into four equal parts by any of these lines, it is said to be *quartered*; which may be done two ways, viz.

Quartered or parted *per cross*; which is made by a perpendicular and horizontal line, which, crossing each other at the centre of the field, divide it into four equal

parts called *quarters*. See Plate CCXXVII. under fig. i. (A).

Quartered or parted *per saltier*; which is made by two diagonal lines, dexter and sinister, that cross one another in the centre of the field, and likewise divide it into four equal parts. *Ibid.*

The escutcheon is sometimes divided into a greater number of parts, in order to place in it the arms of the several families to which one is allied; and in this case it is called a *genealogical atchievement*. These divisions may consist of 6, 8, 12, and 16, quarters [as under fig. i. (A)], and even sometimes of 20, 32, 64, and upwards; there being examples of such divisions frequently exhibited at pompous funerals. An extraordinary instance of this kind was lately exhibited at the pompous funeral of the late worthy viscountess Townshend, whose corpse was brought from Dublin castle in Ireland to Rainham-hall in Norfolk, one of the principal tenants on horse-back carrying before the hearse a genealogical banner, containing the quarterings of his lordship's and her ladyship's family, to the amount of upwards of 160 coats. Sir George Booth, rector of the valuable living of Ashton under Line, bears six distinct coats of arms in his shield; viz. those for Booth, Barton, Venables, Mountfort, Ashton, Egerton; and has besides a right to 37 other coats: but Sir William Dugdale very justly objects to so many arms being clustered together in one shield or banner, on account of the difficulty of discerning and knowing afunder one coat of arms from another.

SECT. IV. Of the Differences of Coats of Arms.

ARMORISTS have invented divers differences or characteristic marks, whereby bearers of the same coat of arms are distinguished each from others, and their nearness to the principal bearer demonstrated. According to J. Guillim, these differences are to be considered either as ancient or modern.

ART. I. OF ANCIENT DIFFERENCES.

THOSE he calls *ancient differences* consist in *bordures* (A); which is a bearing that goes all round, and parallel to the boundary of the escutcheon, in form of a hem, and always contains a fifth part of the field in breadth. Bordures were used in ancient times for the distinguishing not only of one nation or tribe from another, but also to note a diversity between particular persons descended of one family and from the same parents. This distinction, however, was not expressly signified by invariable marks; nor were bordures always appropriated to denote the different degrees of consanguinity: for, as Sir Henry Spelman observes in his *Aspilogia*, p. 140, ancient heralds, being fond of perspicuous differences, often inverted the paternal tincture, or sometimes inserted another charge in the escutcheon, such as bends, crozlets, cantons, or the like; which irregularity has, I suppose, induced modern armorists to invent and make use of others."

There are bordures of different forms and tinctures, as in the examples, fig. iii.

3 I 2

N^o 1.

(A) Bordures are still introduced into English coats of arms, but for particular reasons, which heralds can best explain. They are by the French frequently taken for a principal figure, and numbered among the rest of the ordinaries.

Ancient
Differences.
Plate
CCXXVIII

No 1. is "Sable, a Bordure Argent;" borne by the right hon. Sackville Tufton, earl of Thanet.—When a bordure is plain, you are not to mention it, as it is always understood so in heraldry, though it be not expressed; but if it has any other form, you are to signify it.

2. "Gules, a Bordure engrailed Argent;" borne by the right hon. Charles Gray, lord Gray.—This is called *engrailed*, from the French word *engrêlé*, which signifies a thing the hail has fallen upon and broken off the edges, leaving it with little semicircles struck out of it.

3. "Gules, a Bordure engrailed Or;" borne by the right hon. George Talbot, earl of Shrewsbury. You must observe, that, in a bordure or ordinary formed of these lines, the points are represented on all sides towards the field, and the semicircles turned towards the bordure or ordinary.

4. "Argent, a Bordure invected Azure."—This is quite contrary to the last; for as the other turns its points from the bordure into the field, so contrarywise this does, by the inversion of the points from the field into the bordure. Such a charge or any other formed of these lines is seldom to be met with in English coats of arms.

5. "Gules, a Bordure indented Argent."—The word *indented* requires very little explanation, the signification being obvious to all persons, from its figure, which is composed of tracks resembling teeth, called in Latin *dentes*.

6. "Azure, a Bordure Ermine."

7. "Vert, a Bordure Vair."

8. "Ermine, a Bordure compony, or gobony, Or and Sable."—This is so termed from its being composed of small and equal pieces. J. Guillim calls this bordure *gobonated*, which implies the same meaning; but the word being obsolete, is not used by modern heralds.

9. "Quarterly, Azure and Gules, a Bordure compony Argent and Azure;" borne by his grace Henry Somerset, duke of Beaufort, &c.

10. "Azure, a Bordure counter-compony Argent and Gules."—Observe, that the counter-compony does always consist of two tracks and no more.

11. "Or, a Bordure chequy Argent and Sable."—This has a great resemblance with the last bordure, having only one track more; therefore you must take care, before you blazon, to number them, or else you may easily err in taking the one for the other.

12. "Gules, a Bordure Argent charged with eight Trefoils slipped proper, that is, Vert."—All nations use few terms in blazoning bordures; but English armorists, in order possibly to raise the dignity of this science, have perplexed it, and rendered it unintelligible to all foreigners, by introducing into it several mystical names, among which may be reckoned the following ones, *viz.* They call a bordure, if charged with eight plants, fruits, flowers, or leaves, *verdoy* of such vegetables; or *enaluron* of such birds; *enurny* of beasts; *per-flew* of furs; and *entoyre* of inanimate things of what kind soever.

13. "Gules on a Bordure Azure, eight Stars Or."

14. "Argent, a bordure compony of the last and Gules, the first charged with Roses of the second,

barbed and seeded proper."—This bordure is borne by his grace Charles Lenox, duke of Richmond, &c.

15. "Ermine, within a Bordure engrailed Gules;" the coat of arms of the right hon. Henry-Benedict Barnewall, viscount Kingsland, &c. of Ireland.—This ancient and noble family is of French extraction, and allied to the dukes of Little-Bretagne, where the name continues still in great repute.

16. "Argent, a Bordure Sable charged with eight Bescants;" borne by the right hon. ——— Cole, lord Ranelagh, of Ireland.

17. "Party per pale Argent and Gules, a Bordure charged with eight Escalops counterchanged;" the coat of arms of the right hon. William Maule, earl of Panmure, &c. of Ireland. This very ancient family is originally French, and derives its surname from the town and lordship of Maule in Normandy, where the same arms are still to be seen in the parish-church.

18. "Azure, a Bordure quarterly, the first and fourth Ermine, the second and third counter-compony Argent and Azure."

19. "Purpure, a Bordure compony Or and Gules, each of the last charged with a Bescant."

20. "Quarterly Or and Gules, within a Bordure Vert, charged with eight Escalops Or."

We shall conclude this head with observing, that a bordure is never of metal upon metal, and seldom of colour upon colour, but rather of the tincture which the principal bearing or charge is of. Thus Sir — Dalziel of Glenae, whose predecessor was a younger brother of the noble family of Carnwath, has, within a Bordure Argent, the paternal coat of the ancient name of Dalziel, *viz.* "Sable, a hanged man with his arms extended, Argent;" formerly they carried him hanging on a gallows. This bearing, though so very singular for a coat of arms, was given as a reward to one of the ancestors of the late Robert Dalziel, earl of Carnwath, to perpetuate the memory of a brave and hazardous exploit performed in taking down from a gallows the body of a favourite and near relation of king Kenneth II. hung up by the Picts; which story is thus related by Alexander Nisbet: "The king being exceedingly grieved that the body of his minion and kinsman should be so disgracefully treated, he proffered a great reward to any of his subjects who would adventure to rescue his corpse from the disgrace his cruel enemies had unjustly put upon it: but when none would undertake this hazardous enterprise, at last a valourous gentleman came and said to the king, *Dalziel*, which signifies, "I dare;" and he did actually perform that noble exploit to the king's satisfaction and his own immortal honour, and in memory of it got the afore said remarkable bearing; and afterwards his posterity took the word *Dalziel* for their surname, and the interpretation of it, *I dare*, continues even to this day to be the motto of that noble family." We can have no better proof of the truth of this tradition than this, that the heads of this ancient family have for many ages carefully retained this bearing without any alteration or addition.

ART. 2. Of MODERN DIFFERENCES.

THE modern differences which the English have adopted not only for the distinguishing of sons issued out

Ancient
Differences.

Fig. 3.
BORDURES

Fig. 4.
TABLE of HOUSES

HERALDRY

Plate CCXXXVIII.
Fig. 5.
CHIEFS &c.

Fig. 6.
PALES &c.

Modern Differences. out of one family, but also to denote the difference and subordinate degrees in each house from the original ancestors, are nine, *viz.*

Plate CCXXVII. For the heir or first son, the Label. 2d son, the Crescent. 3d son, the Mullet. 4th son, the Martlet. 5th son, the Annulet. 6th son, the Flower-de-luce. 7th son, the Rose. 8th son, the Cross moline. 9th son, the Double Quater-foil.

By these differences, the six sons of Thomas Beauchamp, the 15th earl of Warwick, who died in the 34th year of king Edward III. are distinguished in an old window of the church of St Mary at Warwick; so that although they are called *modern differences*, their usage with the English is ancient.

It must be observed, that, of all the forementioned marks of distinction, none but the label is affixed on the coats of arms belonging to any of the royal family; which the introducers of this peculiarity have, however, thought proper to difference by additional pendants and distinct charges on them.

Plate CCXXVIII. As to the distinction to be made in the arms of the offspring belonging to each of the above mentioned brothers, it is expressed by figures on the top and margin of the table contained in fig. iv. For instance, The heir or first son of the second house, beareth a crescent charged with a label during his father's life only. The second son of the second house, a crescent charged with another crescent. The third son of the second house, a crescent charged with a mullet. The fourth son of the second house, a crescent charged with a martlet. The fifth son of the second house, a crescent charged with an annulet. The sixth son of the second house, a crescent charged with a flower-de-luce; and so on of the other sons, taking care to have them of a different tincture.

In what part of the escutcheon these differences should be borne is not certain; for Guillim, Morgan, and others, give us many different examples of their position. The honour-point would be the properest place, if the arms would admit of it; but that is not always the case, as that part may be charged with some figure in the paternal coat, which cannot with propriety receive the difference. There are instances where these are borne as perfect coats of arms, as the examples subjoined to the Table of Houses sufficiently show; which are to be blazoned thus:

The first is "Azure, a Label Argent."—When such a label is borne as a difference, the pendants, according to G. Leigh, signify that he is but the third person; the dexter pendant referring to his father, the sinister to his mother, and the middle one to himself.

The second is "Argent, a Label of five points Azure;" borne by the name of Hentington. If a label has more or less than three pendants or points, they are to be expressed as in the foregoing example.

The third is "Azure, a Crescent Argent," borne by the name of Lucy.—The reason G. Leigh assigns for the second son's having a crescent for a difference is to show that he should increase the family by adding to it riches and reputation.

The fourth is "Argent, a Mullet Sable, on a Chief Azure, a Fleur-de-lis Or;" borne by the name of Rogers, in Gloucestershire.—A mullet or spur was appointed for the third son's difference, as the last-

mentioned author says, to show that he should follow chivalry.

The fifth is "Azure, a Fleur-de-lis Argent;" borne by the right hon. Henry Digby, baron Digby of Geashil, in King's county, Ireland.

These few examples, among many more that might be given, demonstrate the impropriety of adopting these *modern differences*, as they are called, for marks of cadency to distinguish the different branches of a family: for it is impossible to distinguish the uncle or grand-uncle from the nephew or grand-nephew, if each of them are second, third, or fourth sons; and in the course of succession these differences would multiply to such a number, that it would be impossible to delineate them distinctly in most cases. But as they are given by most of the English writers on heraldry, though no foreign nation uses them, it was thought proper to insert them here.

Sisters, except of the blood-royal, have no other mark of difference in their coats of arms, but the form of the escutcheon (as observed before); therefore they are permitted to bear the arms of their father, even as the eldest son does after his father's decease. The reason of which is by Guillim said to be, that when they are married, they lose their surname, and receive that of their husbands.

Next to these diminutions, G. Leigh, J. Guillim, and after them Dr Harris in his *Lexicon Technicum*, set forth at large divers figures, which they pretend were formerly added to the coats of such as were to be punished and branded for cowardice, fornication, slander, adultery, treason, or murder, for which they give them the name of *abatements of honour*; but as they produce but one instance of such whimsical bearings, we have not inserted them here. Besides, arms being marks of honour, they cannot admit of any note of infamy; nor would any body now-a-days bear them if they were so branded. It is true, a man may be degraded for divers crimes, particularly high treason; but in such cases the escutcheon is reversed, trod upon, and torn in pieces, to denote a total extinction and suppression of the honour and dignity of the person to whom it belonged.

C H A P. III.

Of the C H A R G E S.

ARMORISTS call a charge whatsoever is contained in the field, whether it occupy the whole or only a part thereof. All charges are distinguished by the names of *honourable ordinaries*, *sub-ordinaries*, and *common charges*.

Honourable ordinaries, the principal charges in heraldry, are made of lines only, which, according to their disposition and form, receive different names.

Sub-ordinaries are ancient heraldic figures, frequently used in coats of arms, and which are distinguished by terms appropriated to each of them.

Common charges are composed of natural, artificial, and even chimerical things; such as planets, creatures, vegetables, instruments, &c.

SECT. I. Of Honourable Ordinaries.

THE most judicious armorists admit only of nine honourable ordinaries, *viz.*

The:

The Chief
The Pale
The Bend
The Bend sinister
The Fefs

The Bar
The Cheveron
The Cross
and
The Saltier.

Of these, but six have diminutives, which are called as follows: That of the chief is a *fillet*; the pale has a *pallet* and *endorse*; the bend, a *bendlet*, *cost*, and *ribband*; the bend sinister has the *scarp* and *bâton*; the bar, the *closet* and *barulet*; the cheveron, a *chevronel* and *couple-clofe*. All which will be treated of in order.

ART. I. Of the CHIEF.

THE chief is an ordinary determined by an horizontal line, which, if it is of any other form but straight, must be expressed. It is placed in the upper part of the escutcheon, and containeth in depth the third part of the field. Its diminutive is a *fillet*, the content of which is not to exceed one fourth of the chief, and standeth in the lowest part thereof. This ordinary is subject to be charged with variety of figures; and may be indented, wavy, nebule, &c. as in the examples, fig. v.

Plate
CCXXVIII

N^o 1. is "Or, a Chief indented Azure;" borne by the right hon. Edmund Butler, viscount Mountgarret, &c. of the kingdom of Ireland. This great and illustrious family of the Butlers, so renowned for the many valiant and loyal persons it has produced, is descended from the ancient counts of Brion in Normandy; but since king Henry II. conferred the office of chief butler of Ireland upon one of the family, he and his successors have assumed the name of *Butler*.

2. "Azure a Chief engrailed Or."
3. "Argent, a Chief invected Vert."
4. "Vert, a Chief undy Or."
5. "Azure, a Chief nebule Argent."
6. "Or, a Chief checky Azure and Argent."
7. "Ermine, a Chief quarterly Or and Gules;" borne by the name of Peckham.

8. "Argent, a Chief Sable, in the lower part thereof a Fillet of the Field."

9. "Azure, fretty Argent, a Chief Or;" borne by the right hon. Hayes St Leger, viscount Doneraile, &c. of the county of Cork in Ireland. This ancient and noble family is of French extraction; and is descended from Sir Robert Sent Legère, knight, who, in 1066, accompanied William duke of Normandy in his expedition into England; and the family have a tradition, that he, with his own hand, supported the said duke when he quitted the ship to land in Suffex.

10. "Argent, on a Chief engrailed Azure, a Tortoise passant Or;" borne by the name of *Bidgood*.

11. "Argent, on a Chief Gules, two Spur revels Or;" borne by the right hon. John St John, lord St John of Bletshoe, &c. Of this ancient family, which derive their surname from a place called *St John* in Normandy, was John de St John, Esq; who having a principal employment in the army of the Norman duke, attended him in his expedition into England.

12. "Argent, on a Chief Vert, two Spears Heads erect of the Field, the points imbrued Gules;" borne

by the right hon. George Brodrick, Viscount Middleton, &c. of the kingdom of Ireland. This family is lineally descended from George de Brodrick, who came into England in the reign of William II.

13. "Or, on a Chief Sable, three Escalops of the field," for the name of *Graham*; and borne quartered in the arms of his Grace William Graham, duke, marquis, and earl of Montrose, &c. with Argent three Roses Gules. According to the Scots writers, this great and noble family is descended from the renowned Greme or Grame, who, in the year 404, was general of king Fergus II.'s army, and, in 420, forced his way through the wall built by the Romans between the rivers Forth and Clyde to keep out the Scots from molesting them in their possessions, and the said breach has ever since been called *Grame's dike*.

14. "Argent, on a Chief indented Gules, three Crosses pattee of the Field;" borne by the right hon. John Perceval, earl of Egmont, &c. This very ancient and noble family is supposed, from circumstances little short of positive proof, to have sprung from a younger branch of the sovereign dukes of Bretagne in France, of the same name. They were transplanted into Normandy before the conquest, possessed of great estates and power, and invested with the office of chief butler. Upon the Norman invasion, two of this family came over into England with the Conqueror, from one of which the descent of the present earl of Egmont is deduced by the clearest and most indisputable proofs of historians and records.

15. "Azure, on a Chief indented Or, three Spur-revels Gules;" borne by the right hon. Charles Moore, earl of Drogheda, &c. of the kingdom of Ireland. This noble family, which is of French extraction, came into England soon after the conquest, and made their first residence in the manor of Moore-court, in the county of Kent.

16. "Ermine, on a Chief indented Azure, three ducal coronets Or;" borne by the name of *Lytton*.

17. "Azure, on a Chief Or, three Martlets Gules," for the name of *Wray*; and borne by Sir Cecil Wray, Bart. of Lincolnshire.

18. "Ermine, on a Chief Gules; five Lozenges of the first;" borne by the name of *Dixin*.

19. "Argent, fretty Gules, on a Chief of the second, three Leopard's Faces Or;" borne by the right hon. Henry Liddel, lord Ravensworth. This noble lord is descended from the ancient lords of Liddle-castle, in the county of Durham, where they have been proprietors of great coal-mines time out of mind.

20. "Ermine, a Chief party per pale Azure and Or; on the dexter the Sun in its splendor, on the sinister a Cross pattee Gules." The arms of the bishopric of Raphoe, in the kingdom of Ireland.

ART. II. Of the PALE.

THE Pale is an ordinary, consisting of two perpendicular lines drawn from the top to the base of the Escutcheon, and contains the third middle part of the field. Its diminutives are, the *pallet*, which is the half of the pale; and the *endorse*, which is the fourth part of a pale. This ordinary and the pallet may receive any charge, but the endorse should not be charged. The endorse, besides, is never used, according to J. Leigh,

Of the
Pale.

Leigh, but to accompany the pale in pairs, as cotices do the bend; but Sir John Ferne is of a different opinion.

Plate
CCXXVIII
fig. vi.

Ex. 1. "Gules, a Pale Or;" by the name of *Grand-main*.

2. "Party per Pale Argent and Gules, a Pale counterchanged."

3. "Argent, a Pale between two Endorfs Gules."

4. "Party per Pale, 1st, Paly of six Argent and Sable, 2d, Azure;" borne by the name of *Trenchard*.

5. "Paly of six Or and Azure."

6. "Argent, three Pallets undy Sable;" by the name of *Downes*.

7. "Party per Pale, Argent and Gules;" borne by the right hon. John Waldegrave, earl Waldegrave, &c. This noble earl is descended from John de Waldegrave, who was sheriff of London in the year 1205, in the seventh year of king John.

8. "Party per Pale indented, Or and Gules;" borne by the right hon. Thomas Bermingham, baron of Athenry, in the kingdom of Ireland. Of this ancient and noble family, which are of English extraction, and took their name from the town of Bermingham in the county of Warwick, was William de Bermingham, who was possessed of the town of that name in the reign of Henry II. which continued in that family till the reign of Henry VIII.

9. "Quarterly per Pale dove-tail, Gules and Or;" borne by the right hon. Thomas Cromley, lord Montfort, &c. This noble lord is maternally descended from Sir Walter Bromleghe of Bromleghe, in the county of Stafford, who flourished in the reign of king John. Sir Thomas Bromley, another of his lordship's ancestors, was constituted lord high chancellor of England; 21 Elizabeth; in which post he died, 29 Elizabeth.

10. "Argent, a Pale flory counterflory Sable."

11. "Argent, a Pale lozengy Sable;" borne by the name of *Savage*.

12. "Argent, a Pale indented Vert;" borne by the name of *Dixon*.

13. "Argent, on a Pale engrailed Sable, three Crescents Or;" borne by the name of *Aibly*.

14. "Ermine, on a Pale engrailed azure, three Lion's Heads coupé Or;" borne by the name of *Avery*.

15. "Vert, on a Pale radiant Or, a Lion rampant Sable;" borne by the right hon. James O'Hara, lord Tyrawley, &c. in the kingdom of Ireland. This noble lord is descended from Milesius king of Spain, by his eldest son Hiberius, who, with his brother Heremon, established a colony in Ireland. Sir Charles O'Hara, father to the present lord, was created baron of Tyrawley by queen Anne, Jan. 10. 1706, being at that time a lieutenant-general, and colonel of the royal regiment of fusileers: and the next year was made general in Spain, where this son, lord James, was wounded at the battle of Almanza.

16. "Azure, a Pallet Argent."

17. "Vert, an Endorse Or."

18. "Argent, on two Pallets Sable, six Cross-croissants fitchy Or;" borne by the name of *Betunes*, of the county of Salop.

19. "Argent, two Endorfs Gules, in Chief three Mulletts Sable;" borne by the name of *Vautort*.

20. "Azure, on a Pale walled with three pieces on each side Or, an Endorse Sable;" borne by the name of *Sublet de Noyers*, a family of distinction in France.

ART. III. Of the BEND and BEND-SINISTER.

THE Bend is an ordinary formed by two diagonal lines, drawn from the dexter-chief to the sinister-base; and contains the fifth part of the field in breadth, if uncharged; but if charged, then the third. Its diminutives are, the bendlet, which is the half of a bend; the cost or cotice, when two of them accompany a bend, which is the fourth part of a bend; and the ribband, the moiety of a cost, or the eighth part of the field.

There is also the bend-sinister, which is of the same breadth as the bend, but drawn the contrary way: this is subdivided into a scrape, which is the half of the bend, and into a bâton, which is the fourth part of the bend, but does not extend itself to the extremities of the field, there being part of it seen at both ends. See the examples, fig. vii.

Ex. 1. "Argent, a Bend wavy Sable;" borne by the right hon. John Wallop, earl of Portsmouth, &c. Plate CCXXIX. This noble earl is descended from the Wallops of Hampshire, a Saxon family, who were possessed of lands to a considerable value in the county at the time of the conquest.

2. "Checky Or, and Azure, a Bend Ermine;" borne by the right hon. John Ward, viscount Dudley and Ward, &c. The ancestors of this noble lord were anciently of the county of Norfolk, of which was Simon Ward, who had large possessions in the reign of Edward I. and was in France and Scotland in the reigns of king Edward II. and III.

3. "Azure, a Bend engrailed Argent, between two Cotices Or;" borne by the right hon. Matthew Fortescue, lord Fortescue, as also by the right hon. Hugh Fortescue-Aland, baron Fortescue, in the kingdom of Ireland, this last nobleman bearing a crescent in his arms for difference. The family of Fortescue is descended from Sir Richard le Forte, a person of extraordinary strength and courage, who accompanied William duke of Normandy in his invasion of England; and bearing a strong shield before the duke, at the battle of Hastings, had three horses killed under him, and from that signal event the name and motto of the family were assumed; for the Latin word *scutum*, or the old French word *escue* "a shield" being added to *forte* "strong," compose their name; and the motto is, *Forte scutum salus ducum*.

4. "Sable, a Bend Argent between two Cotices indented Or;" borne by the name of *French*.

5. "Paly of six Or and Sable, a Bend counterchanged;" borne by the right hon. Frederick Calvert, baron Baltimore. The original of this family is from an ancient and noble house of that surname in the earldom of Flanders, whereof Sir George Calvert, knight, among other honourable employments, was secretary of state to king James I. by whom he was created a baron, Feb. 20. 1624, and from whom he had a grant to him, and his heirs, of the province of Maryland and Avalon in America.

6. "Party per Bend crenelle Argent and Gules;" borne by the right hon. Edmund Boyle, earl of Cork and Orrery, &c. in the kingdom of Ireland. This noble lord is said to be descended from Sir Philip Boyle,

Of the Bend, &c. Boyle, a knight of Arragon, who, in the reign of king Henry VI. tilted at a tournament with Sir Joseph Astley, knight of the Garter.

7. "Argent, three Bendlets enhanced Gules;" as the English express it, but the phrase enhanced is used by no other nation. The proper blazon of this arms is, Parted per bend, 1st bendy of six gules, and argent; 2d of the last. Borne by the right hon. William Byron, lord Byron. From Doomsday-book it appears, that this family was possessed of numerous manors and lands in the reign of the Conqueror; and that Sir John Byron, one of his lordship's ancestors, attended king Edward III. in his wars in France.

8. "Ermine, a Bend voided Gules;" borne by the name of *Ireton*.

9. "Argent three Bendlets wavy Azure;" borne by the name of *Wilbraham*.

10. "Bendy of six pieces Argent and Azure." Observe, that when the shield is filled with an equal number of bendlets of metal and colour, it is called *bendy*; but if the number of them is unequal, they are to be blazoned by the name *bendlets*, and their number specified.

11. "Party per Bend Azure and Argent, two Bendlets engrailed counterchanged;" borne by the name of *Frenes*.

12. "Quarterly, Or and Gules, a Bend over-all Vair;" borne by his grace Lionel Cranfield Sackville, duke of Dorset and earl of Middlesex, &c. The ancestors of this family were lords of the town and seigniory of Sackville in Normandy, and came over with the Conqueror when he invaded England in 1066.

13. "Gules on a Bend Argent, three Trefoils slipped proper;" borne by the right hon. George William Hervey, earl of Bristol, &c. This noble lord derives his pedigree from Robert Fitz-Hervey, a younger son of Hervey duke of Orleans, who came over from France with William the Conqueror.

14. "Argent, on a bend Gules cotised Sable, three pairs of Wings conjoined of the first;" borne by the right hon. Richard Wingfield, viscount Powerscourt, in the kingdom of Ireland. This noble lord is denominated from the manor of Wingfield in Suffolk, where they had a feat before the Norman conquest, called *Wingfield-castle*.

15. "Gules, on a Bend contre Ermine cotised Or, three Boars Heads couped Argent;" borne by the right hon. George Edgcumbe, lord Edgcumbe, &c. The ancestors of this noble lord received their name from the manor of Edgcumbe in Devonshire. One of this lord's ancestors was Sir Richard Edgcumbe, who came over to England with the earl of Richmond, having a great share in the victory he obtained over king Richard III. at Bosworth, by which the earl made his way to the throne of England.

16. "Argent, a Bend-finister Gules."

17. "Or, a Bendlet Gules."

18. "Argent, a Ribband Gules."—The name of this bearing corresponds well with its form, being both long and narrow, which is the shape of a ribband.

19. "Azure, a Scrape Or."—This bearing, as Guillim observes, is that kind of ornament called now-a-days a *Scarf*, which is used by officers on duty, and usually worn after the same manner.

N^o 152.

20. This contains three Batons. The first is compony ermine and azure; set over the royal arms, for his grace William Fitzroy duke of Cleveland. The second is compony argent and azure; set over the royal arms, for his grace Augustus Henry Fitzroy, duke of Grafton. The third is gules, charged with three roses argent, seeded and barbed proper; set over the royal arms, for his grace George Beauclerk, duke of St Albans. The grandfathers of these noble dukes being natural sons of king Charles II. is what intitles them to the royal arms.

ART. IV. Of the Fess and Bar.

THE Fess is an ordinary which is produced by two parallel lines drawn horizontally across the centre of the field, and contains in breadth the third part thereof. Some English writers say it has no diminutive, for the bar is a distinct ordinary of itself.

The Bar, according to their definition, is formed of two lines, and contains but the fifth part of the field: which is not the only thing wherein it differs from the fess; for there may be more than one in an escutcheon, placed in different parts thereof, whereas the fess is limited to the centre-point; but in this the French differ from them. The bar has two diminutives; the barulet, which contains the half of the bar; and the closet, which is the half of the barulet. When the shield contains a number of bars of metal and colour alternate, of even number, that is called *barry* of so many pieces, expressing their number. See the examples, Plate CCXXIX. fig. viii.

N^o 1. is "Argent, a Fess indented Sable;" borne by the right hon. John West, earl Delawarr, &c. This noble family is descended from the Wests, a great family in the west of England; but in the reign of Edward II. they appear to have been seized of manors and lands in the county of Warwick. Sir Thomas de West, knight, one of his lordship's ancestors, being at the battle of Cressly, and there taking John the French king prisoner, had granted him, for that remarkable action, an augmentation to his achievement, viz. a crampette or, distinguished by the chape of a sword in the middle; the chape being given him by the said king, as an acknowledgment of his becoming his prisoner: his cognizance was a rose parted per pale, argent, and gules; which two badges are still borne in the achievement of the present lord Delawarr.

2. "Argent, a Fess wreathed Azure and Gules;" borne by the right hon. John Carmichael, earl of Hyndford. Of this ancient family, which is said to assume their surname from the lands of Carmichael, in the county of Lanark, in Scotland, where they still have their chief seat, was Sir John Carmichael, who accompanied Archibald earl of Douglas, to the assistance of Charles VI. of France, against the English; and signalizing his valour at the battle of Baughey in April 1421, and breaking his spear when the French and Scots got the victory, had thereupon added to his paternal coat, a dexter arm holding a broken spear, which is now the crest of the family.

3. "Party per Fess Or and Argent, a Fess nebule Gules;" borne by the name of *Antesbed*.

4. "Party per Fess indented Or and Azure;" borne by the name of *Saunders*.

5. "Checky

The Fefs
and Bar.

The Fefs
and Bar.

5. "Checky Or and Azure on a Fefs Gules, a Crescent argent for difference;" borne by the right hon. Hugh Clifford, lord Clifford, of Chudley. This noble lord is descended from Walter de Clifford, of Clifford castle, in the county of Hereford, who came over into England with the Conqueror; of which family was fair Rosamond, mistress to king Henry II.

6. "Argent, on a Fefs Azure, three Lozenges Or;" borne by the right hon. Basil Fielding, earl of Denbigh and Desmond, &c. This noble earl is descended from the earls of Hapsburg, in Germany. Geoffroy earl of Hapsburg, being oppressed by Rodolph emperor of Germany, came over into England, and one of his sons served king Henry III. in his wars, whose ancestors laying claim to the territories of Lauffenburg and Rhin-Filding, in Germany, he took the name of *Fielding*.

7. "Or, on a Fefs Gules, three Fleur-de-lis of the first;" born by the name of *Lennard*. This is in the first and fourth quarters of the right hon. Thomas Barret Lennard lord Dacre's arms.

8. "Ermine, on a Fefs Gules, a Lion passant Or;" borne by the right hon. John Proby, baron Carysfort, &c. in the kingdom of Ireland.

9. "Sable, a Fefs Ermine, between three Crescents Or;" borne by the right hon. George-William Coventry, earl of Coventry, &c. This noble earl is descended from John Coventry, a native of the city of Coventry, and afterwards mercer and lord mayor of London, in the reign of Henry V.; from whom descended Thomas Coventry, one of the justices of the court of common-pleas, in the reign of queen Elizabeth; whose son Thomas was recorder of London, and afterwards lord keeper of the great seal in the reign of king Charles I.

10. "Sable, a Fefs checky, Or and Azure, between three Besants;" borne by the right hon. Ridgeway Pitt, earl and baron of Londonderry, &c. Of this noble family, which were anciently of Bandfort, in the county of Dorset, was Thomas Pitt, Esq; who, in the reign of queen Anne, was made governor of fort St George in the East Indies, where he resided many years, and purchased a diamond, which he sold to the king of France for 125,000l. Sterling, weighing 136 carats, and commonly known at this day by the name of *Pitt's diamond*.

11. "Or, on a Fefs Sable, between three Muscovy Ducks proper, a Rose of the Field;" borne by the right hon. John Bateman, viscount Bateman, &c. Of this noble family, which was anciently seated at Halebrook, near St Omers in Flanders, was Giles Bateman, Esq; whose son was a merchant of London, and was father to Sir James Bateman, knight, who, in 1712, was chosen member of parliament for Ilchester in the county of Somerset, and re-chosen in 1713.

12. "Sable, on a Fefs Argent, between three Leopards passant guardant Or, three Escalops Gules;" borne by the right hon. Wills Hill, earl of Hillsborough, &c. Of this family, which, in the reign of queen Elizabeth, were of note in the county of Downe, was Sir Moses Hill, who, during O'Neile's rebellion, was one of those gentlemen who associated under the earl of Essex to suppress it; and afterwards served under Arthur lord Chichester, lord deputy, and by king James I. was appointed provost-marshal of the whole province of Ulster in Ireland.

VOL. VIII. Part II.

13. "Gules, two Bars Or;" borne by the right hon. Simon Harcourt, earl of Harcourt, &c. This noble earl is descended from the Harcourts of Normandy, who took their name from a place called *Harcourt*, in that province, where the family usually resided. Gervaise, count de Harcourt, with his two sons Jeffrey and Arnold, came over with the conqueror, when he invaded England in 1066.

14. "Ermine, two Bars Gules;" borne by the right hon. Thomas Nugent, earl of Westmeath, and baron Delvin.

15. "Argent, two Bars indented Sable;" borne by the right hon. Godart Ginkle, earl of Athlone. Godart, who was the first earl, was descended of a very ancient family in the united provinces of Holland, where he was baron de Reede and Ginkle, &c. In 1691, he was a lieutenant-general of king William's forces in Ireland; where, in June the same year, he took Ballymore for the English; and, in July following, the Irish town of Athlone, which last exploit is one of the greatest recorded in history.

16. "Argent, three Bars gemels Gules;" borne by the right hon. Richard Barry, earl of Barrymore, &c. This noble family, who have been renowned for their loyalty and valour, are said to derive their surname from the island of Barry, in the county of Glamorgan, in Wales; and from their riches and estates have been called by the people *Barrymore*, or the Great Barry.

17. "Or, a Fefs-couped Gules, between two Lions passant Sable;" borne by the right hon. Samuel Masham, lord Masham, &c. This noble lord is descended from Sir John Masham, who flourished in the reign of king Henry VI. and was buried at Thorneham, in the county of Suffolk, in 1455.

18. "Argent, a Lion rampant guardant Gules, debruised by a Fefs Azure, between three Etoiles issuing out of as many Crescents of the second;" borne by the right hon. Robert Dillon, earl of Roscommon, &c. in the kingdom of Ireland. This noble family is derived from Logan, surnamed *Dilune* or *Delion*, which signifies brave and valiant, to whom the duke of Aquitaine gave his daughter in marriage, in whose right, after her father's death, he became prince and sovereign of Aquitaine, which continued in his posterity till Henry II. married Alionora, daughter and heir to William V. duke of Aquitaine, and about 1172 obtained that principality by superior force; and, to prevent any disturbance, brought Sir Henry Delion or Dillon, and his brother Thomas, then infants, to England, their father being slain.

19. "Or, two Bars Azure, a Chief quarterly of the second and Gules, the 1st and 4th charged each with two Fleur-de-lis of France; the 2d and 3d with a Lion of England;" borne by his grace John Manners, duke of Rutland, marquis of Granby, &c. This chief was anciently Gules; and the charge thereon is an honorary augmentation, showing his grace's descent from the blood-royal of king Edward IV.

20. "Barry of ten pieces Argent and Azure, over all six Escutcheons; 3, 2, 1, Sable, each charged with a Lion rampant of the first, armed, and langued Gules, a Crescent for difference;" borne by the right hon. James Cecil, earl of Salisbury, &c. This noble earl is descended from the famous *William Cecil* lord Burleigh, statesman in the reigns of Edward VI.

3 K

and

Of the
Cheveron.

and Elizabeth. This great man left two sons, Thomas and Robert, who were both made earls in one day, May 4. 1603. Robert, the younger son, ancestor of the present noble lord, was created earl of Salisbury in the morning; and Thomas, the eldest, earl of Exeter in the afternoon.

ART. V. Of the CHEVERON.

THE Cheveron, which represents two rafters of a house well jointed together, or a pair of compasses half open, takes up the fifth part of the field with the English, but the French give it the third. Its diminutives are, The cheveronel, which contains the half of a cheveron; and the couple-close, which is the half of a cheveronel, that is, its breadth is but the fourth part of a cheveron. Leigh observes, that this last diminutive is never borne but in pairs, or with a cheveron between two of them. The French have but one diminution of this ordinary called *Etaie*, containing the third part of its breadth.

Examples of cheverons are given in fig ix. viz.

Plate
CCXXIX.

1. "Argent, a Cheveron Gules between three Torteaux;" borne by the right hon. Bennet Sherard, earl of Harborough, &c. This noble earl is lineally descended from Scherard, who was possessed of manors and lands to a great value in the counties of Cheshire and Lancashire in the reign of William the Conqueror. Geoffroy, another of this earl's ancestors, was three times sheriff of Rutlandshire, in the reigns of king Edward IV. and king Richard III.

2. "Sable, a Cheveron between three Etailes Argent;" borne by the right hon. Marmaduke Langdale, lord Langdale. This noble lord is descended from the Langdales of Yorkshire, who resided at the town of Langdale, from whence they took their name, in the reign of king John; but his ancestor, who makes the greatest figure in history, is Sir Marmaduke Langdale, who raised forces in the north of England in defence of king Charles I. was victorious in numberless battles and sieges; and when his majesty, by the united forces of England and Scotland, was at length overpowered, he attended king Charles II. in his exile, and returned to England with his majesty at the restoration.

3. "Sable, a Cheveron between three Leopards Heads Or;" borne by the right hon. William Wentworth, earl of Strafford, &c. All genealogists agree, that the name of *Wentworth* is of Saxon original, and taken from the manor of Wentworth in Yorkshire, where, in the reign of William the Conqueror, lived Reginald de Wentworde, as it is spelt in doomsday-book.

4. "Argent, a Cheveron between three Grifons passant Sable, a Crescent for difference;" borne by the right hon. Heneage Finch, earl of Ailesford, &c. This family is descended from Herbert Fitz-Herbert, earl of Pembroke, and chamberlain to king Henry I. They took the name of *Finch* in the reign of king Edward I. One of the ancestors of the present earl was the right hon. Heneage Finch, earl of Nottingham, who was constituted lord high-chancellor of England in 1675; and lord high-steward on the trials of Philip earl of Pembroke, and William viscount Stafford, in 1680.

5. "Azure, a Cheveron Ermine, between three

Escalops Argent;" borne by the right hon. George Townshend, viscount Townshend, &c. This family is of Norman extraction, and came into England about the time of the conquest. Charles, lord viscount Townshend, grandfather of the present viscount, was appointed principal secretary of state in the reign of king George I. in 1720, and continued so to the end of his majesty's reign; when, upon resigning the seals, they were returned to him again by his late majesty king George II. who continued him in that honourable office to the year 1730.

6. "Azure, a Cheveron between three Mulletts Or;" borne by the right hon. John Chetwind viscount Chetwind, &c. of the kingdom of Ireland. Of this family, which hath been of great antiquity in the county of Salop, taking their surname from Chetwynd in that county, was Adam de Chetwynd, who married Agnes daughter of John lord Lovel, baron of Dockinges, and lord of Minster Lovel in Oxfordshire; and by her had issue Sir John de Chetwynd, who, in the 37th of Henry III. had a charter of free-warren, thro' all his demesne in the counties of Salop, Stafford, and Warwick.

7. "Argent, a Cheveron Gules, between three square Buckles Sable;" borne by the right hon. Matthew Ducie-Morton, lord Ducie, &c. This noble lord is descended from the Ducies in Normandy. After they came into England, king Edward I. conferred on them the lordship of Morton in Staffordshire, and several other lordships and manors, which the family enjoyed for many years. Sir Robert Ducie, one of his lordship's ancestors, was lord mayor of London in the reign of king Charles I. and though he lent his majesty L. 80,000, which was lost by the king's being driven out of London, he died, however, worth L. 400,000.

8. "Argent, a Cheveron Checky Gules, and of the Field, between three Bagle-horns strung Sable, garnished of the second;" borne by the right hon. lord Hugh Semple, lord Semple. The principal family of this name was Semple of Elliotton in Renfrew, where they had large possessions and offices, as stewards and bailiffs under the family of Stewart, proprietors of that county before they came to the crown. The first lord Semple was Sir Robert, who, being much in favour with king James IV. was by him created lord Semple in 1489.

9. "Argent, a Cheveron engrailed between three Lions passant Sable;" borne by the right hon. and the reverend Philip Smithe, viscount Strangford. One of this lord's ancestors was John Smithe, Esq; who acquired a considerable estate whilst he was farmer of the customs in the reign of Henry VIII. He left two sons, John and Sir Thomas; which last was sent ambassador by king James I. to the empress of Russia.

10. "Quarterly Argent and Azure, a Cheveron engrailed counter-changed;" borne by the name of *Chamber*.

11. "Party per Cheveron engrailed Gules and Argent, three Talbots Heads erased counter-changed;" borne by the right hon. Anthony Duncombe, lord Feverham, &c. His lordship is descended from the Dancombes of Barley-end in Buckinghamshire. Sir Charles Duncombe, uncle to the present lord, was lord mayor of London in 1709; and this nobleman was created

Of the
Cheveron.

created lord Feversham and baron of Dowton in Wiltshire, June 23. 1744.

12. "Paly of six, Argent and Gules, on a Cheveron Azure, three Crosses crozlets Or;" borne by the name of *Carpenter*, baron Carpenter, of Killaghy in Ireland. This ancient and noble family are of great antiquity in the county of Hereford, and have been lords of the manor of the Home in the parish of Delwyn, near Weobly, for above 300 years. George, the first lord Carpenter, was so created May 4. 1719.

13. "Azure, on a Cheveron Or, between three Bessants, a Bay Leaf Proper;" borne by the right hon. James Hope, earl of Hopeton, &c. This noble family is descended from Henry Hope, a native of Holland, who, about two centuries ago, came over and settled in Scotland. Charles Hope, Esq; grandfather of the present earl, was created an earl by queen Anne, April 15. 1703.

14. "Vert, on a Cheveron between three Unicorns Heads erased Argent, horned and maned Or, three Mulletts Sable;" borne by the name of *Ker*, being the 1st and 4th quarters in the arms of his grace John Ker, duke of Roxburgh, &c. This ancient family is said to come from Normandy. John Ker, marquis of Beaumont and Cesford, the first duke of Roxburgh, was so created April 27. 1707.

15. "Azure, on a Cheveron Or, between three Bears Heads couped Argent, muzzled Gules, a Roebuck's Head erased, between two Hands holding Daggers all proper;" borne by the right hon. Donald Mackay, lord Reay. This family is said to derive their descent from Alexander, a younger son of Ochoacker, who, about the end of the twelfth century, came from Ireland; and the fourth in descent from him was Donald of Strathnavern, whose son was named *Y More*: and from him began the surname of *Mac Y, Mackie*, or *Mackay*. Donald, the first lord of this family, was created baronet in 1625, and on June 20. 1628, was created baron Reay of the county of Caithness, by Charles I.

16. "Ermine, on a Cheveron Azure, three Foxes Heads erased Or, and in a Canton of the second a Fleur-de-lis of the third;" borne by the right hon. Stephen Fox, earl of Ilchester, &c. Of the family of Fox there have been many persons of note living in the counties of Dorset, Somerset, Wilts, and Hants, particularly Richard Fox, bishop of Winchester. His lordship was created lord Ilchester and baron Strangeways, May 11. 1741, 14 Geo. II. and earl of Ilchester in June 1756.

17. "Or, two Cheveronels Gules;" borne by the right hon. John Monson, lord Monson. This noble lord is descended from John Monson, who flourished in the reign of king Edward III. from whom descended another John, who attended king Henry V. in his wars in France. Sir John Monson, bart. father of the present lord, was created lord Monson, May 28. 1728.

18. "Or, on a Fess, between two Cheveronels Sable, three Cross-crozzlets of the first;" borne by the right hon. George Walpole, earl of Orford, &c. This family took their name from Walpole in Norfolk, where they resided before the conquest. Sir Robert Walpole was, in king George II.'s reign, elected

knight of the garter in 1726, and created earl of Orford, February 9. 1741-2.

19. "Azure, three Cheveronels interlaced Or, and a Chief of the last;" borne by the name of *Fitz-Hugh*.

20. "Argent, three Cheveronels Gules, in Chief a Label Azure;" borne by the right hon. William Wildman Barrington, viscount Barrington, &c. This family is of Norman extraction; in which duchy, whilst it continued annexed to the English crown, there were to be seen the remains of a castle bearing the name of *Chute* or *Shute*, and formerly in the family, with other monuments in several towns of that duchy. John Shute, the late viscount Barrington, was in 1708 made a commissioner of the customs, and succeeded to the estates of Francis Barrington, Esq; and of John Wildman of the county of Berks, who made him their heir; and, in pursuance of the will of the former, he took the name and arms of *Barrington*. On June 11. 1720, he was created viscount Barrington.

ART. VI. Of the Cross.

THE *Cross* is an ordinary formed by the meeting of two perpendicular with two horizontal lines in the fess-point, where they make four right-angles; the lines are not drawn throughout, but discontinued the breadth of the ordinary, which takes up only the fifth part of the field when not charged; but if charged, then the third. It is borne as well engrailed, indented, &c. as plain.

There is so great a variety of crosses used in heraldry, that it would be a very difficult task to treat of them all. Guillim has mentioned 39 different sorts; De la Columbiere, 72; Leigh, 46; and Upton declares he dares not ascertain all the various crosses borne in arms, for that they are almost innumerable: therefore, as all their forms cannot be expected here, we will only take notice of such as are most commonly seen at present in coats-of-arms. See Fig. x.

The first is "Quarterly, Ermine and Azure, a Cross Or;" borne by his grace Thomas Osborne duke of Leeds, &c. This noble duke is descended from the honourable family of the Osbornes of Ashford, in the county of Kent; Sir Thomas Osborne, the grandfather to the present duke, was advanced to the peerage by king Charles II.

2. "Gules, a Cross engrailed Argent, a Lozenge in the dexter-chief of the second;" borne by the right hon. Edward Leigh, lord Leigh. This family took their surname from the town of High-Leigh in Cheshire, where they resided before the Norman conquest. Sir Thomas Leigh, the first lord of this family, was created baron Leigh of Stonely, by king Charles I. on July 1. 1643.

3. "Gules, a Cross Argent fretty Azure;" borne by the right hon. Nicholas Taaffe, viscount Taaffe, of Corran, &c. in Ireland. Of this noble and ancient family was Richard Taaffe, who lived in 1282; as in 1306 did John Taaffe, who was archbishop of Armagh; and, in 1479, the order of the Garter being established in Ireland, Sir Nicholas Taaffe was one of the first members; and John, his son and heir, was created a baron and viscount by Charles I. August 1. 1628.

4. "Sable,

Plate
CCXXIX.

Of
the Cross.

Of
the Crofs.

4. "Sable, a Crofs raguly Or;" borne by the name of *Stoway*.

5. "Argent, on a Crofs Sable, a Leopard's face Or;" borne by his grace Henry Brydges duke of Chandos, &c. The ancestors of this noble family took their name from the city of Bruges in Flanders; and one of them came over with William the Conqueror, and had a considerable share in the victory obtained near Hastings in Suffex, 1066. James, the father of the present duke, was created viscount Wilton and earl of Caernarvon, October 19. 1714; and marquis of Caernarvon and duke of Chandos, — 30. 1719.

6. "Or, on a Crofs Sable, a patriarchal Crofs of the Field;" borne by the right hon. Thomas Vesey, baron of Knapton in the kingdom of Ireland. The truly noble family of Vesey or Vesey, derives its origin from Charles the Great, king of France, and emperor of the west, who died at Aix-la-Chapelle in Germany, Jan. 28. 814. His lordship's father was created a peer April 10. 1750.

7. "Argent, on a Crofs Gules, five Escalops Or;" borne by the right hon. William Villiers earl of Jersey, &c. This noble earl is descended from the family of Villiers in Normandy, some of whom came over to England with the Conqueror; several manors and lands in England being soon after granted to Pagan de Villiers, one of this earl's ancestors. The first peer of this family was created a baron and viscount, March 20. 1690.

8. "Sable, on a Crofs within a Bordure engrailed Or, five Pellets;" borne by the right hon. Francis Greville, earl of Brooke and Warwick, &c. The ancestors of this noble family are of Norman extraction, and came over with William the Conqueror, who conferred manors and lands on them in England, of a considerable value; and at length they obtained the government of the castle of Warwick, the present seat of the family. Sir Fulke, the first peer of this family, was created baron Brooke by king James I. Jan. 9. 1620.

9. "Argent, a Crofs botonny Sable;" borne by the name of *Winwood*.

10. "Or, a Crofs-croset Gules;" borne by the name of *Taddington*.

11. "Azure, a Crofs potent fitchy Or." This ensign is said to have been borne by Ethelred king of the West Saxons; and crosses of this sort are frequently met with in coats-of-arms.

12. "Party per pale, Gules and Argent; a Crofs potent quadrate in the centre, between four Crosses patee counter-changed;" the arms of the episcopal see of Litchfield and Coventry. This see was originally fixed at Litchfield; from thence removed to Chester, and from both to Coventry. It contains the whole county of Stafford, except two parishes; all Derbyshire; the better part of Warwickshire, and near half Shropshire; divided into the four archdeaconries of Coventry, Stafford, Derby, and Salop. The parishes are 557 in number; but, including chapels, they amount to 643.

13. "Azure, a Crofs moline Argent;" borne by his grace Cavendish Bentinck, duke of Portland, &c. This noble duke is descended from a very ancient and distinguished family in the United Provinces of Holland, of which was William Bentinck, Esq; who,

in his youth was page of honour to William prince of Orange, afterwards William III. king of Great Britain, and, on the accession of William and his consort, was made groom of the stole, privy-purse to his majesty, lieutenant-general of his majesty's army, &c. and also created baron of Cirencester, viscount Woodstock, and earl of Portland, April 19. 1689.

14. "Argent, a Crofs patonce Sable;" borne by the name of *Rice*.

15. "Sable, a Crofs patee Argent;" borne by the name of *Maplesden*.

16. "Azure, a Crofs flowery Or;" borne by the name of *Cheney*.—This is said to have also been the arms of Edwin, the first Christian king of Northumberland.

17. "Argent, six Crofs crosetts fitchy 3, 2, 1, Sable, on a Chief Azure, two Mulletts pierced Or;" borne by his grace Henry Clinton, duke of Newcastle, &c. This noble family is descended from Jeffrey de Clinton, lord chamberlain and treasurer to king Henry I. grandson to William de Tankerville, chamberlain of Normandy; from whom descended William de Clinton, chief justice of Chester, governor of Dover castle, lord Warden of the king's forests south of Trent. Edward lord Clinton, another of this noble earl's ancestors, was constituted lord high-admiral of England for life, in the reign of queen Elizabeth, who created him earl of Lincoln, May 4. 1572.

18. "Gules, a Cheveron between ten Crosses patee, six above and four below, Argent;" borne by the right hon. Frederick-Augustus Berkeley, earl of Berkeley, &c. This noble family is descended from Robert Fitz-Harding, who obtained a grant of Berkeley-castle in Gloucestershire, which the family still inherits, and from whence they obtained the surname of *Berkeley*, from Henry duke of Normandy, afterwards king of England; the said Robert Fitz-Harding was descended from the royal line of the kings of Denmark.

19. "Azure, three Mulletts Or, accompanied with seven Crofs-crosetts fitchy Argent, three in Chief, one in Fess, two in Flanks, and the last in Base;" borne by the right hon. James Somerville, lord Somerville. The first of this name on record is Sir Walter de Somerville, lord of Wichmore, in the county of Stafford, who came to England with William the Conqueror.

20. "Gules, three Crosses recerceleé, voided Or, a Chief vairy ermine and contre ermine;" borne by the right hon. John Peyto Verney, baron Willoughby de Broke. This noble lord is descended from William de Vernai, who flourished in the reign of king Henry I. 1119.

ART. VII. Of the SALTIER.

THE Saltier, which is formed by the bend and bend-sinister crossing each other in right angles, as the intersecting of the pale and fess forms the cross, contains the fifth part of the field; but if charged, then the third. In Scotland, this ordinary is frequently called a *St Andrew's cross*. It may, like the others, be borne engrailed, wavy, &c. as also between charges or charged with any thing. See examples, fig. xi.

Of the
Saltier.Plate
CCXXIX.Of the
Saltier.

N^o 1. is "Argent, a Saltier Gules;" borne by his grace James Fitz-Gerald, duke of Leinster, &c. This noble lord is descended from Otho, or Other, a rich and powerful lord in the time of king Alfred, descended from the dukes of Tuscany; who passing from Florence into Normandy, and thence into England, there the family flourished, until Richard Strongbow, earl of Pembroke, their kinsman, engaged them to partake in his expedition to Ireland, in which Maurice Fitz-Gerald embarked, and was one of the principal conquerors of that kingdom, for which he was rewarded with a great estate in lands in the province of Leinster, and particularly the barony of Offaley, and the castle of Wicklow; and died, covered with honours, in the year 1177, 24 Henry II.

2. "Gules, a Saltier Argent, between twelve Cross crosets Or;" borne by the right hon. Other-Lewis Windsor Hickman, earl of Plymouth, &c. This noble earl is descended from Robert Fitz-Hickman, lord of the manor of Bloxham, Oxfordshire, in the 56 Hen. III. 1272; and he is maternally descended from the noble family of the Windsors, who were barons of the realm at the time of the conquest.

3. "Vert, a Saltier wavy Ermine;" borne by the name of *Wakeman* of Beckford, in Gloucestershire.

4. "Ermine, a Saltier counter-compony Or and Gules;" borne by the name of *Ulmston*.

5. "Argent, a Saltier Azure with a Bezant in the centre;" borne by the right hon. Philip Yorke, earl of Hardwicke, &c. He was in October 1733 constituted lord chief-justice of the king's bench, and November 23. in the same year, created baron Hardwicke of Hardwicke.

6. "Argent on a Saltier Gules an Escalop Or;" the arms of the bishoprick of Rochester—This diocese, the least in England, comprehends only a small part of Kent, in which there are 150 churches and chapels; and the two parishes in Iselham in Cambridgeshire, and Frekenham in Suffolk. It has only one archdeacon, that of Rochester. For many years it was in the immediate patronage of the archbishop of Canterbury.

7. "Party per Saltier, Azure and Argent, on a Saltier Gules, a Crescent of the second for difference;" quartered by the right hon. William Hall Gage, viscount Gage, of Castle-Island in Ireland. This noble family is of Norman extraction, and derives descent from de Gaga or Gage, who attended William I. in his expedition to England; and, after the conquest thereof, was rewarded with large grants of lands in the forest of Dean, and county of Gloucester, near which forest he fixed his residence, by building a seat at Clerenwell, in the same place where the house of Gage now stands: he also built a great house in the town of Cirencester, at which place he died, and was buried in the abbey there. Sir Thomas Gage, the eighth baronet, was created baron of Castle-Bar, and viscount Gage, 1721.

8. "Gules, on a Saltier Argent, a Rose of the first barbed and seeded proper;" borne by the right hon. George Neville, lord Abergavenny, premier baron of England.

9. "Or, on a Saltier Azure, nine Lozenges of the first;" the paternal arms of the right hon. John Dalrymple, earl of Stair, &c. Of this family, which took their surname from the barony of Dalrymple, ly-

ing on the river Dun in Ayrshire, Scotland, was Adam de Dalrymple, who lived in the reign of Alexander III.

10. "Argent, on a Saltier engrailed Sable, nine Annulets Or;" borne by the name of *Leak*.

11. "Gules, a Saltier between four Crescents Or;" borne as the second and third quarters in the coat of-arms of the right honourable Charles Kinnaid, lord Kinnaid. George Kinnaid, Esq; one of the present lord's ancestors, being of great service to king Charles II. during the usurpation of Oliver Cromwell, he was by that prince, at his restoration, made one of the privy council; and December 28. 1682, created a baron.

12. "Argent, a Saltier engrailed between four Roses Gules," for Lennox; and borne as first and fourth quarters in the coat-of-arms of the right hon. Francis Napier, lord Napier. This family is said to be descended from the ancient thanes or stewards of Lennox in Scotland, but took their surname of Napier from the following event. King David II. in his wars with the English, about the year 1344, convoking his subjects to battle, the earl of Lennox sent his second son Donald, with such forces as his duty obliged him; and, coming to an engagement, where the Scots gave ground, this Donald, taking his father's standard from the bearer, and valiantly charging the enemy with the Lennox men, the fortune of the battle changed, and they obtained the victory; whereupon every one advancing, and reporting their acts, as the custom was, the king declared they had all behaved valiantly, but that there was one among them who had *na pier*, that is, no equal; upon which the said Donald took the name of Napier, and had, in reward for his good services, the lands of Gosfield, and other estates in the county of Fife.

13. "Gules, a Saltier Or, surmounted of another Vert," for the name of *Andrews*; and borne by Sir William Andrews, bart. of Denton in Northamptonshire, who is descended from Sir Robert Andrews of Normandy, knight, who came into England with William the Conqueror. Sir William Andrews, the first baronet of this family, was created December 11. 1641.

14. "Azure, a Saltier quarterly quartered Or and Argent." The arms of the episcopal see of Bath and Wells.—The diocese of Bath and Wells contains all Somersetshire, except a few churches in Bristol. And in it there are three archdeaconries, viz. those of Wells, Bath, and Taunton. The number of the parishes is 388, though, according to some, the total number of the churches and chapels amounts to 503.

15. "Party per Saltier Argent and Gules, a Saltier counter-changed."

16. "Party per Pale indented Argent and Sable, a Saltier counter-changed;" borne by the name of *Scote*.

17. "Argent, three Saltiers coupé and engrailed Sable;" borne by the name of *Benton*.

18. "Argent, a Saltier Gules, and a Chief Ermine;" borne by the right hon. Francis Thomas Fitz-Maurice, earl of Kerry, &c. This very ancient and noble family is a branch of the family of Kildare, who are originally descended from the great duke of Tuscany, and of which was Otho, a noble baron of Italy, whose son Walter, attending the Norman conqueror

into

Sub-
Ordinaries.

into England, was made constable of the castle of Windsor. Raymond, one of the present earl's ancestors, had a principal hand in the reduction of Ireland to the subjection of Henry II. and Dermoid Mac-Carty, king of Cork, fought his aid against his son Cormac O'Lehanagh, which he undertook, and delivered the king from his rebellious son; for which that prince rewarded him with a large tract of land in the county of Kerry, where he settled his son Maurice, who gave his name to the county, which he called *Clan Maurice*, and is enjoyed by the present earl of Kerry, who is viscount *Clan Maurice*. Thomas the first earl, and father of the last, was the 21st lord-Kerry, who was created earl January 17. 1722.

19. "Sable, a Saltier Argent, on a Chief Azure, three Fleurs-de-lis Or;" borne by the right hon. John Fitz-Patrick, earl of Upper Ossory, and baron of Gowran in Ireland. This most ancient and princely family is descended from Heremon, the first monarch of the Milesian race in Ireland; and after they had assumed the surname of Fitz-Patrick, they were for many ages kings of Ossory, in the province of Linster. John, the first earl of this family, succeeded his father Richard as Lord Gowran, June 9. 1727, was created earl October 5. 1751, and died 1758.

20. "Party per Pale Argent and Gules, three Saltiers counter-changed;" borne by the name of *Lane*. These arms are also borne, without the least alteration, by the name of *Kingsman*; for which similitude we can no otherwise account, than by supposing there has been some mistake made through many transcriptions.

SECT. II. Of Sub-Ordinaries.

BESIDES the honourable ordinaries and the diminutions already mentioned, there are other heraldic figures, called *sub-ordinaries*, or *ordinaries* only, which, by reason of their ancient use in arms, are of worthy bearing, viz. The Gyron, Franc-quarter, Canton, Pairle, Fret, Pile, Orle, Inescutcheon, Treffure, Annulet, Flanches, Flafques, Voiders, Billet, Lozenge, Gutts, Fusil, Rustre, Mascle, Papillone, and Diaper. See Plate CCXXVII. fig. i. (A.)

The Gyron is a triangular figure formed by two lines, one drawn diagonally from one of the four angles to the centre of the shield, and the other is drawn either horizontal or perpendicular, from one of the sides of the shield, meeting the other line at the centre of the field.

Gyronny is said, when the field is covered with six, eight, ten, or twelve gyrons in a coat-of-arms: but a French author would have the true gyronny to consist of eight pieces only, as in the fig. which represents the coat-of-arms of Flora Campbell countess of Loudon, &c. whose ancestor was created baron of Loudon in 1604 by James VI. and earl of the same place, May 12. 1633, the 9th of Charles I.

The Franc-quarter is a square figure, which occupies the upper dexter quarter of the shield. It is but rarely carried as a charge. Silvestra Petra Sancta has given us a few instances of its use.

The Canton is a square part of the escutcheon, somewhat less than the quarter, but without any fixed proportion. It represents the banner that was given to ancient knights-bannerets, and, generally speaking, possesses the dexter-chief-point of the shield, as in the

fig.; but should it possess the sinister corner, which is but seldom, it must be blazoned a canton-sinister.

James Coats reckons it as one of the nine honourable ordinaries, contrary to most heralds opinion. It is added to coats-of-arms of military men as an augmentation of honour: thus John Churchill, baron of Eymouth in Scotland, and one of the ancestors of the present duke of Marlborough, being lieutenant general to king James II. received from him a canton argent, charged with the red cross of England, added to his paternal coat, "which is Sable, a lion rampant Argent."

The pairle is a figure formed by the conjunction of the upper half of the saltier with the under half of the pale.

The Fret is a figure representing two little sticks in saltier, with a mascle in the centre interlaced. J. Gibbon terms it the *heralds true lovers knot*; but many dissent from his opinion.

Fretty is said when the field or bearings are covered with a fret of six, eight, or more pieces, as in the fig. The word *fretty* may be used without addition, when it is of eight pieces; but if there be less than that number, they must be specified.

The pile, which consists of two lines, terminating in a point, is formed like a wedge, and is borne engrailed, wavy, &c. as in the fig. It issues in general from the chief, and extends towards the base; yet there are some piles borne in bend, and issuing from other parts of the field, as may be seen in Plate CCXXX. fig. xii. n° 12, &c.

The Orle is an ordinary composed of two lines going round the shield, the same as the bordure, but its breadth is but one half of the latter, and at some distance from the brim of the shield, as in the fig.

The Inescutcheon is a little escutcheon borne within the shield; which, according to Guillim's opinion, is only to be so called when it is borne single in the fess-point or centre; see the fig. on Plate CCXXVII. but modern heralds, with more propriety, give the name of *inescutcheon* to such as are contained in Plate CCXXX. fig. xii. n° 2. and call that which is fixed on the fess-point *escutcheon of pretence*, which is to contain the arms of a wife that is an heiress, as mentioned above.

The Treffure is an ordinary commonly supposed to be the half of the breadth of an orle, and is generally borne flowery and counter-flowery, as it is also very often double, and sometimes treble. See the fig. (Plate CCXXVII.). This double treffure makes part of the arms of Scotland, as marshalled in the royal achievement, Plate CCXXXII. fig. xxi. n° 7. and was granted to the Scots kings by Charlemagne, being then emperor and king of France, when he entered into a league with Achais king of Scotland, to show that the French lilies should defend and guard the Scottish lion.

The Annulet, or ring, is a well-known figure, and is frequently to be found in arms through every kingdom in Europe. Plate CCXXVII.

The Flanches are formed by two curved lines, or semicircles, being always borne double. See the figure. G. Leigh observes, that on two such Flanches two sundry coats may be borne.

The

Sub-
Ordinaries.

Sub-
Ordinaries.Sub-
Ordinaries.

The Flashes resemble the flanches, except that the circular lines do not go so near the centre of the field; (see the figure). J. Gibbon would have these two ordinaries to be both one, and wrote *flank*; alleging, that the two other names are but a corruption of this last: but as G. Leigh and J. Guillim make them two distinct and subordinate ordinaries, we have inserted them here as such.

The Voiders are by Guillim considered as a subordinate ordinary, and are not unlike the flashes (see the figure), but they occupy less of the field.

The Billet is an oblong square figure, twice as long as broad. Some heralds imagine, that they represent bricks for building; others more properly consider them as representing folded paper or letters.

The Lozenge is an ordinary of four equal and parallel sides, but not rectangular; two of its opposite angles being acute, and the other two obtuse. Its shape is the same with those of our window-glasses, before the square came so much in fashion. See the figure.

Gutts, or drops, are round at bottom, waved on the sides, and terminate at the top in points. Herald's have given them different names according to their different tinctures: thus, if they are

Yellow	} they are called	<i>d' Or</i>
White		<i>d' Eau</i>
Red		<i>de Sang</i>
Blue		<i>de Larmes</i>
Green		<i>de Vert</i>
Black		<i>de Poix</i>

The Fusil is longer than the lozenge, having its upper and lower part more acute and sharp than the other two collateral middle parts, which acuteness is occasioned by the short distance of the space between the two collateral angles; which space, if the fusil is rightly made, is always shorter than any of the four equal geometrical lines whereof it is composed. See the fig. *ibide*.

The Rustre is a lozenge pierced round in the middle (see the figure). They are called by the Germans *rusten*. Menestrier gives an example of them in the arms of Lebarret in France, argent three rustres azure.

The Mascle is pretty much like a lozenge, but voided or perforated through its whole extent, showing a narrow border, as in the figure. Authors are divided about its resemblance; some taking it for the mesh of a net, and others for the spots of certain flints found about Rohan; and as no writer has given a clearer account in support of this last opinion than Colombiere, author of *La Science Heraldique*, we shall transcribe it for the satisfaction of the curious.

"Rohan (says he) bears Gules, nine Mascles Or, 3, 3, 3. Opinions have varied very much about the original of the mascles or meshes, as being somewhat like the meshes of nets: but for my own part, having often observed that those things which are remarkable and singular in some countries, have sometimes occasioned the lords thereof to represent them in their escutcheons, and to take them for their arms, I am of opinion, that the lords of Rohan, who, I believe, are the first that bore these figures in their arms, tho' descended from the ancient kings and princes of Bretagne, took them, because in the most ancient viscounty of Rohan, afterwards erected into a duchy, there are

abundance of small flints, which being cut in two, this figure appears on the inside of them; as also the carps, which are in the fish-ponds of that duchy, have the same mark upon their scales; which, being very extraordinary and peculiar to that country, the ancient lords of the same had good reason, upon observing that wonder, to take those figures for their arms, and to transmit them to their posterity, giving them the name of *mâcles*, from the Latin word *macula*, signifying a spot; whence some of that house have taken for their motto, *Sine macula macula*, that is, A mascle without a spot."

Papillone is an expression used for a field or charge that is covered with figures like the scales of a fish. Mons. Baron gives as an example of it the arms of Monti Gueules-Papelone d'Argent. The proper term for it in English would be *scallop-work*.

Diapering is said of a field or charge shadowed with flourishings or foliage with a colour a little darker than that on which it is wrought. The Germans frequently use it; but it does not enter into the blazoning or description of an arms, it only serves to embellish the coat.

If the fore-mentioned ordinaries have any attributes, that is, if they are engrailed, indented, wavy, &c. they must be distinctly specified, after the same manner as the honourable ordinaries.

See examples of subordinaries, &c. fig. xii.

1. "Gules, an Orle Ermine;" borne by the name of Humframville. Plate CCXXXI

2. "Argent, three Inescutcheons Gules;" borne by the name of Hay, and the 2d and 3d quarters in the coat-of-arms of the right hon. Thomas Hay, earl of Kinnoul, &c.—The first of the name of Hay that bore these arms, got them, as Mr Nisbet observes, because he and his two sons, after having defeated a party of the Danes at the battle of Loncarty, anno 942, were brought to the king with their shields all stained with blood.

3. "Argent, a Fret Sable;" borne by the right hon. Lionel Talmish, earl of Dysart, &c. This family was advanced to the peerage by King Charles I. in 1646.

4. "Or, fretty of Gules, a Canton Ermine;" borne by the right hon. Henry Noel, earl of Gainsborough, &c. This nobleman is descended from — Noel, who came into England with William the Conqueror, and, in consideration of his services, obtained a grant of several manors and lands of very great value. Sir Edward, who was knighted by King James on his accession to the throne, and created a baronet June 29. 1611, was the first advanced to the honour of baron Noel, March 23. 1616.

5. "Girony of eight Pieces Or and Sable;" the 1st and 4th quarters of the coat-of-arms of the right hon. John Campbell, earl of Breadalbane, &c. This ancient and noble family is descended, in a regular succession, from Duncan the first Lord Campbell, ancestor of the family of Argyll. John, the first earl, in consideration of his personal merit, was, from a baronet, created lord Campbell, viscount Glenorchie, and earl of Breadalbane, Jan. 28. 1677, by Charles II.

6. "Lozenge Argent and Gules;" borne by the right hon. George Fitz-William, earl Fitz-William, &c. This noble earl is descended from Sir William Fitz-William,

Sub-
Ordinaries.

Fitz-William, marshal of the army of William the Conqueror at the battle of Hastings in Suffex, by which victory that prince made his way to the throne.

7. "Sable, a Mascle within a Tressure flowery Argent;" borne by the name of *Hoblethorne*.

8. "Gules, three Mullets Or, within a Bordure of the latter, charged with a double Tressure flowery and counter-flowery with Fleurs-de-lis of the first;" borne by the noble family of Sutherland, &c. This family, in the peerage, is among the oldest in Britain, if not in all Europe; the title of *earl* being conferred on one of their ancestors in 1067.

9. "Azure, a Pile Ermine," for the name of *Wyche*; and is quartered as first and fourth in the coat-of-arms of Sir Cyril Wyche, bart.

10. "Or, on a Pile engrailed Azure, three Cross-crosetts fitchy of the first;" borne by the name of *Rigdon*.

11. "Or, on a Pile Gules three Lions of England between six Fleurs-de-lis Azure;" the first and fourth quarters of his grace Edward Seymour, duke of Somerset, &c. granted him by King Henry VIII. on his marriage with the lady Jane Seymour.

12. "Ermine, two Piles issuing from the dexter and sinister sides, and meeting in base Sable;" for the name of *Holles*.

13. "Argent, three piles, one issuing from the Chief between the others reversed, Sable;" for the name of *Hulse*, and borne by Sir Edward Hulse, bart.

14. "Azure, a Pile wavy bendways Or;" borne by the name of *Aldham*.—There is no mention made of its issuing out of the dexter-corner of the escutcheon, for this is sufficiently determined by the term *bendways*.

15. "Or, three Piles in Bend, each point ensigned with a Fleur-de-lis Sable;" borne by the name of *Norton*.

16. "Argent, three Piles meeting near the point of the Base Azure;" borne by the name of *Bryan*.

17. "Party per Pale and per Bend Or and Azure counterchanged;" borne by the name of *Johnson*.—This bearing is equal to two gyrons; see p. 454. col. 1.

18. "Party per Pale and per Cheveron Argent and Gules counterchanged."

19. "Party per Pale chappé Or and Vert counterchanged." This is a bearing seldom to be met with.

20. "Party per Fefs Gules and Argent, a Pale counterchanged;" borne by the name of *Lavider*.

SECT. III. Of COMMON CHARGES born in Coats-of-arms.

It has been already observed, that in all ages men have made use of the representation of living creatures, and other symbolical signs, to distinguish themselves in war; and that these marks, which were promiscuously used for hieroglyphics, emblems, and personal devices, gave the first notion of heraldry. But nothing shows the extent of human wit more, than the great variety of these marks of distinction, since they are composed of all sorts of figures, some natural, others artificial, and many chimerical; in allusion, it is to be supposed, to the state, quality, or inclination of the bearer.

Nº 152.

Hence it is, that the sun, moon, stars, comets, meteors, &c. have been introduced to denote glory, grandeur, power, &c. Lions, leopards, tygers, serpents, stags, &c. have been employed to signify courage, strength, prudence, swiftness, &c.

The application to certain exercises, such as war, hunting, music, &c. has furnished lances, swords, pikes, arms, fiddles, &c. Architecture, columns, cheverons, &c.; and the other arts several things that relate to them.

Human bodies, or distinct parts of them, also clothes, and ornaments, have, for some particular intention, found place in armory; trees, plants, fruits, and flowers, have likewise been admitted to denote the rarities, advantages, and singularities, of different countries.

The relation of some creatures, figures, &c. to particular names, has been likewise a very fruitful source of variety in arms. Thus the family of Coningsby bears three coney; of Arundel, six swallows; of Urson, a bear; of Lucie, three pikes, in Latin *tres lucios pisces*; of Starkey, a stork; of Castleman, a castle triple-towered; of Shuttleworth, three weaver's shuttles, &c.

Besides these natural and artificial figures, there are chimerical or imaginary ones used in heraldry, the result of fancy and caprice; such as centaurs, hydras, phenixes, griffons, dragons, &c. Which great variety of figures shows the impossibility of comprehending all common charges in a work of this nature; therefore such only shall be treated of as are most frequently borne in coats-of-arms.

ART. I. Of NATURAL FIGURES borne in coats-of-arms.

AMONG the multitude of natural things which are used in coats-of-arms, those most usually borne are, for the sake of brevity as well as perspicuity, distributed into the following classes, viz.

Celestial figures; as, the sun, moon, stars, &c. and their parts.

Effigies of men, women, &c. and their parts.

Beasts; as, lions, stags, foxes, boars, &c. and their parts.

Birds; as, eagles, swans, storks, pelicans, &c. and their parts.

Fishes; as dolphins, whales, sturgeons, trouts, &c. and their parts.

Reptiles and insects; as, tortoises, serpents, grasshoppers, &c. and their parts.

Vegetables; as, trees, plants, flowers, herbs, &c. and their parts.

Stones; as, diamonds, rubies, pebbles, rocks, &c.

These charges have, as well as ordinaries, divers attributes or epithets, which express their qualities, positions, and dispositions. Thus the sun is said to be in *his glory*, *eclipsed*, &c. The moon, in *her complement*, *increfcent*, &c. Animals are said to be *rampant*, *passant*, &c. Birds have also their denominations, such as *close*, *displayed*, &c. Fishes are described to be *hauriant*, *naïant*, &c.

I. Examples of Celestial Figures.

1. "Azure, a Sun in his Glory;" borne by the name of *St Clare*; and is found in the first and fourth quarters

Fig. 14.
EFFIGIES &c.

quarters of the coat-of-arms of the most noble William-John Ker, marquis of Lothian, &c. It is needless to express the colour of the sun, nothing being capable to denote it but gold.

2. "Azure, one Ray of the Sun, bendways Gules, between six Beams of that Luminary Argent;" borne by the name of *Aldam*. There is no mention made of their issuing out of the dexter-corner of the escutcheon; for this is implied in the term *bendways*, for the reason mentioned before.

3. "Argent, five Rays of the Sun issuing out of the sinister-corner Gules;" borne by the name of *Mudtshideler*, a family of distinction in Franconia.

4. "Or, a Sun eclipsed." This bearing is seldom to be met with, except in emblematic or hieroglyphic figures; and might be expressed *Sable*, because that hue is accidental and not natural.

5. "Gules, the Moon in her complement Or, illustrated with all her light proper." This is sufficient without naming the colour, which is *Argent*.

6. "Azure, a Moon decreascent proper;" borne by the name of *Delaluna*.

7. "Gules, a Moon increascent Or;" borne by the name of *Descus*.

8. "Argent, a Moon in her *detriment*, *Sable*." This word is used in heraldry to denote her being eclipsed.

9. "Azure, a Crescent Argent;" borne by the name of *Lucy*. This bearing is also used as a difference, it being assigned to the second son, as before-mentioned.

10. "Gules, three Crescents Argent;" borne by Oliphant, lord Oliphant (at present dormant). Amongst the ancestors of this noble family was David de Oliphant, one of those barons who, in 1142, accompanied King David I. into England with an army, to assist his niece Matilda against King Stephen; but after raising the siege of Winchester, the said King David was so closely pursued, that, had it not been for the singular conduct of this brave person, the king would have been taken prisoner.

11. "Azure, a Crescent between three Mullets Argent;" borne by Arbuthnot, viscount and baron Arbuthnot. In the year 1105, the first of this family marrying a daughter of the family of Oliphant, sheriff of the county of Kincardin, with her he had the lands of Arbuthnot in that county, from whence he took his surname. Robert Arbuthnot was the first of this family who, for his loyalty to King Charles I. was, Nov. 16. 1641, dignified with the title of *baron* and *viscount Arbuthnot*.

12. "Gules, a Star issuing from between the Horns of a Crescent Argent."

13. "Azure, a Star of 16 points Argent;" borne by the name of *Huitson*.

14. "Argent, three Mullets pierced *Sable*;" borne by the name of *Wollaston*.

15. "Azure, six Mullets 3, 2, 1, Or;" borne by the name of *Wells*.

16. "Ermine, a Mullet of six points Gules, pierced;" borne by the name of *Hessenbul*.—When a mullet has more than five points, their number must, in blazoning, be always named.

17. "Argent, a Rainbow with a Cloud at each end proper." This is part of the crest to the earl of
VOL. VIII. Part II.

Hopeton's coat-of-arms, which is inserted in fig. ix. n° 13. The whole of it is a globe split on the top, and above it is the rain-bow, &c.

18. "Party per Fefs crenelle Gules and Azure, three Suns proper;" borne by the name of *Pierfon*.

19. "Gules, a Mullet between three Crescents Argent;" borne by the name of *Oliver*.

20. "Gules, a Chief Argent, on the lower part thereof a Cloud, the Sun's resplendent rays issuing throughout proper;" borne by the name of *Leeson*.

II. Examples of Effigies of Men, &c. and their parts.

1. "Azure, the Virgin Mary crowned, with her Babe in her right arm and a sceptre in her left, all Or;" the coat of arms of the bishopric of Salisbury.

2. "Azure, a Presbyter sitting on a Tomb-stone, with a Crown on his head and Glory Or, his right hand extended, and holding in his left an open Book Argent, with a Sword cross his mouth Gules;" the coat of arms of the bishopric of Chichester.

3. "Azure, a Bishop habited in his pontificals, sitting on a chair of state, and leaning on the sinister side thereof, holding in his left hand a Crosier, his right being extended towards the dexter chief of the escutcheon, all Or, and resting his feet on a cushion, Gules, tasseled of the second;" the coat of arms of the bishopric of Clogher in Ireland.

4. "Azure, a Bishop habited in his pontificals, holding before him, in a Pale, a Crucifix proper;" the coat of arms of the bishopric of Waterford in Ireland.

5. "Or, a Man's Leg couped at the midst of the thigh Azure;" borne by the name of *Haddon*.

6. "Azure, three sinister Hands couped at the wrist, and erected Argent;" borne by the ancient family of Malmain.

7. "Argent, three sinister Hands couped at the wrist, and erected Gules;" borne by the name of *Maynard*.—By these two last examples it appears, that different coats of arms may be easily made from the same figure or figures, by varying the colours only, without the addition of any other charge, counter-changings, partings, &c.

8. "Argent, a Man's Leg erased at the midst of the thigh *Sable*;" borne by the name of *Prime*.

9. "Gules, three Legs armed proper, conjoined in the Fefs-point at the upper part of the thighs, flexed in triangle, garnished and spurred, Or." This is the coat of arms of the Isle of Man; and is quartered by the most noble John Murray, duke of Athol, titular lord or king of that isle.

10. "Gules, three dexter Arms vambraced fessways in Pale proper;" borne by the name of *Armstrong*. This coat is very well adapted to the bearer's name, and serves to denote a man of excellent conduct and valour.

11. "Or, three Legs couped above the knee *Sable*;" borne by the name of *Hofy*.

12. "Vert, three dexter Arms conjoined at the shoulders in the Fefs-point, and flexed in triangle Or, with fists clenched Argent;" borne by the name of *Tremain*.

13. "Argent, a Man's Heart Gules, within two equilateral triangles interlaced *Sable*;" borne by the name of *Villages*, a family of distinction in Provence.

14. "Azure, a sinister Arm, issuing out of the
3 L dexter-

Fig. 14.

Positions of
Lions. dexter-chief, and extended towards the sinister-base
Argent."

15. "Argent, a dexter Hand couped at the wrist and erected, within a bordure engrailed Sable;" borne by the name of *Manley*.

16. "Argent, a Man's Heart Gules, ensigned with a Crown Or, and on a Chief Azure, three Mûlets of the first." The paternal coat of the name of *Douglas*, and quartered in the arms of the dukes of Hamilton and Queensberry; as also in those of the earls of Morton and March, and the lord Mordington.

17. "Gules, a Saracen's Head affrontée erased at the neck Argent, environed about the temples with a wreath of the second and Sable;" borne by the name of *Margith*.

18. "Argent, three Blackamoors Heads couped proper, banded about the head Argent and Gules;" borne by the name of *Tanner*.

19. "Gules, three Besants, each charged with a man's face affrontée proper;" borne by the name of *Gamin*.

20. "Or, a Blackamoor's Head couped proper, banded about the head Argent;" borne by the name of *Ustoc*.

Observe, that when half of the face, or little more, of human figures, is seen in a field, it is then said to be *in profile*; and when the head of a man, woman, or other animal, is represented with a full face, then it is termed *affrontée*.

III. Examples of the different Positions of Lions, &c. in Coats-of-Arms.

1. "Or, a Lion rampant Gules;" quartered by Percy, duke of Northumberland, &c.

2. "Azure, a Lion rampant-guardant Or;" borne by the name of *Fitz-Hammond*.

3. "Gules, a Lion rampant-reguardant Or;" quartered by Cadogan, lord Cadogan, &c.

4. "Ermine, a Lion saliant Gules;" borne by the name of *Worley*.

5. "Azure, a Lion statant-guardant Or;" borne by the name of *Bromfield*.

6. "Or, a Lion passant Gules;" borne by the name of *Games*.

7. "Argent, a Lion passant-guardant Gules, crowned Or;" quartered by the right hon. James Ogilvy, earl of Findlater, &c.

8. "Gules, a Lion sejant Argent."

9. "Or, a Lion rampant double-headed Azure;" borne by the name of *Mason*.

10. "Sable, two Lions rampant-combatant Or, armed and langued Gules;" borne by the name of *Carter*.

11. "Azure, two Lions rampant-adossée Or." This coat of arms is said to have been borne by Achilles at the siege of Troy.

12. "Sable, two Lioncels counter-passant Argent, the uppermost towards the sinister side of the escutcheon, both collared Gules;" borne by the name of *Glegg*.—It is the natural disposition of the Lion not to bear a rival in the field: therefore two lions cannot be borne in one coat of arms, but must be supposed to be lion's whelps, called *lioncels*; except when they are parted by an ordinary, as in fig. viii. n° 17. or so disposed as that they seem to be distinctly separated from each other, as in fig. xv. n° 20. In the two foregoing

examples they are called *lions*, because in the 10th they seem to be striving for the sovereignty of the field, which they would not do unless they were of full growth: and in the 11th they are supposed to represent two valiant men, whose dispute being accommodated by the prince, are leaving the field, their pride not suffering them to go both one way.

13. "Argent, a Demi-lion rampant Sable;" borne by the name of *Mervin*.

14. "Gules, a Lion couchant between six Cross-crosets, three in Chief, and as many in Base, Argent;" for the name of *Tynte*; and is the first and fourth quarter of the arms of Sir Charles Kemys Tynte, bart.

15. "Azure, a Lion dormant Or."

16. "Or, out of the midst of a Fess Sable, a Lion rampant-naissant Gules;" borne by the name of *Emme*. This form of blazon is peculiar to all living things that shall be found issuing out of the midst of some ordinary or other charge.

17. "Azure, three Lioncels rampant Or;" borne by Fienes, viscount and baron Saye and Sele.

18. "Gules, a tricorporated Lion issuing from three parts of the Escutcheon, all meeting under one Head in the Fess-point Or, langued and armed Azure;" borne by the name of *Crouchback*. This coat appertained to Edmund Crouchback earl of Lancaster, in the reign of his brother king Edward I.

19. "Gules, a besant between three Demi-lions rampant Argent;" borne by Bennet, earl of Tankerville, &c. This noble earl is descended from the family of the Bennets in Berkshire, who flourished in the reign of king Edward III. Charles, lord Offulston, grandfather of the present earl, was created earl of Tankerville on October 19. 1714, by George I.

20. "Party per Pale Azure and Gules, three Lions rampant Argent;" borne by Herbert earl of Pembroke, &c. This noble family is descended from Henry Fitz-Roy, natural son to Henry I. Sir William Herbert, one of the ancestors of the present earl, was master of the horse to king Henry VIII. lord president of the marches of Wales, and knight of the garter. He was also, by that king, advanced to the dignity of baron Herbert of Caerdiff, Oct. 10. 1551, and the very next day created earl of Pembroke.—Observe, that if a lion, or any other beast, is represented with its limbs and body separated, so that they remain upon the field at a small distance from their natural places, it is then termed *Debaché* or *couped in all its parts*; of which very remarkable bearing there is an instance in armory, which is, "Or, a Lion rampant Gules, debaché, or couped in all its parts, within a double Tressure flowery and counter-flowery of the second;" borne by the name of *Maitland*.

IV. Examples of other Quadrupeds, and their Parts, borne in Coats-of-Arms.

1. "Sable, a Camel statant Argent;" borne by the name of *Camel*. Fig. 16.

2. "Gules, an Elephant statant Argent, tusked Or."

3. "Argent, a Boar statant Gules, armed Or;" borne by the name of *Trewarthen*.

4. "Sable, a Bull passant Or;" borne by the name of *Fitz-Geffrey*.

5. "Sable, three Nags Heads erased Argent;" borne

Plate
CCXXXI.
fig. 15.

Different
Animals.

Birds,
Fishes, &c.

borne by Blayney, baron Blayney of Monaghan, in Ireland. This noble family is descended in a direct line from Cadwallader, a younger son of the prince of Wales; and the first peer was Sir Edward Blayney, knight, who was created a baron by king James I. July 29. 1621.

6. "Argent, three Boars Heads erased and erect Sable, langued Gules," for the name of *Booth*.

7. "Azure, three Boars Heads erased Or;" quartered by his grace Alexander Gordon duke of Gordon, &c. Of this great and noble family, which took their surname from the barony of Gordon in the county of Berwick, there have been, besides those in North Britain, several of great distinction in Muscovy; and in the time of king Malcolm IV. 1160, this family was very numerous, and flourished in the county aforesaid.

8. "Argent, three Bulls Heads erased, Sable, armed Or;" borne by Skeffington, earl of Massareene, &c. of Ireland. This ancient and noble family derives its name from the village of Skeffington, in the county of Leicester, of which place Simon Skeffington was lord in the reign of Edward I. and from him descended Sir William Skeffington, knt. made so by king Henry VII.

9. "Argent, two Foxes counter-saliant, the dexter surmounted of the finister Gules;" for the name of *Kadrod-Hard*, an ancient British family, from which is descended Sir Wynne, bart. who bears this quartered, second and third, in his coat of arms.

10. "Argent, three Bulls passant Sable, armed and unguled Or;" for Ashley, and quartered by the right hon. Anthony-Ashley Cooper, earl of Shaftesbury, &c. This noble earl is descended from Richard Cooper, who flourished in the reign of king Henry VIII. and purchased the manor of Paulet in the county of Somerset, of which the family are still proprietors. But his ancestor who makes the greatest figure in history is Sir Anthony-Ashley Cooper, who was created baron Ashley of Winbourn April 20. 1661, and afterwards earl of Shaftesbury April 23. 1672.

11. "Ermine, three Cats passant in Pale Argent;" for the name of *Adams*.

12. "Gules, two Greyhounds rampant Or, respecting each other;" borne by the name of *Dogget*.

13. "Or, an Ass's Head erased Sable;" borne by the name of *Hackwell*.

14. "Gules, three Lions gambes erased Argent;" for the name of *Newdigate*.

15. "Argent, three Lions Tails erected and erased Gules;" borne by the name of *Cork*.

16. "Azure, a Buck's Head cabossed Argent;" borne by Legge, earl of Dartmouth, &c. This noble family is descended from Signior de Lega, an Italian nobleman, who flourished in Italy in the year 1297. What time the family came into England is uncertain; but it appears they were settled at Legge place, near Tunbridge in Kent, for many generations; and Thomas, one of their ancestors, was twice lord-mayor of London, viz. in 1346 and 1353.

17. "Argent, two Squirrels sejant adossée Gules;" for the name of *Samwell*.

18. "Gules, a Goat passant Argent;" borne by the name of *Baker*.

19. "Sable, a Stag standing at gaze Argent;" borne by the name of *Jones*, of Monmouthshire.

20. "Azure, three Holy Lambs Or;" borne by the name of *Row*.

V. *Examples of Birds, Fishes, Reptiles, &c.*

1. "Ermine, an Eagle displayed Sable;" borne by the name of *Beddingfield*. Fig. 17.

2. "Gules, a Swan close proper;" borne by the name of *Leigham*.

3. "Argent, a Stork Sable, membered Gules;" borne by the name of *Starkey*.

4. "Gules, a Pelican in her nest with wings elevated, feeding her young ones Or; vulned proper;" borne by the name of *Carne*.

5. "Argent, three Peacocks in their pride proper;" borne by the name of *Pawne*.

6. "Sable, a Goshawk Argent, perching upon a stock in the Base-point of the Escutcheon of the second, armed, jessed, and belled Or;" borne by the name of *Weele*.

7. "Or, a Raven proper;" borne by the name of *Corbet*.

8. "Argent, three Cocks Gules, crested and jowlopped Sable, a Crescent surmounted of a Crescent for difference;" borne by Cockayne, viscount Cullen, of Donegal in Ireland. Of this ancient family was Andreas Cockayne of Ashburne in the county of Derby, who lived in the 28th year of Edward I. Charles, son to Sir William Cockayne lord-mayor of London, 1619, was the first who was advanced to the peerage, by Charles I. August 11. 1642.

9. "Sable, a Dolphin naiant embowed Or;" borne by the name of *Symonds*. This animal is borne by the eldest son of the French king, and next heir to the crown, no other subject in that kingdom being permitted to bear it. In England, where that rule cannot take place, there are several families that have dolphins in their coats-of-arms.

10. "Argent, three Whales Heads erect and erased Sable;" borne by the name of *Whalley*.

11. "Gules, three Escallops Argent;" borne by Keppel, earl of Albemarle, &c. This family is descended from Arnold Joost van Keppel, a nobleman of the province of Gelderland in Holland, who came over into England with the prince of Orange in 1688, to whom he was then a page of honour, and afterwards master of the robes, and was by him created a peer of England, by the title of earl of Albemarle, in the duchy of Normandy in France, February 10. 1696.

12. "Azure, three Trouts fretted in Triangle Argent;" borne by the name of *Troutbeck*.

13. "Vert, a Grasshopper passant Or."

14. "Azure, three Bees two and one volant in pale Argent;" borne by the name of *Bye*.

15. "Vert, a Tortoise passant Argent;" borne by the name of *Garudy*.

16. "Gules, an Adder nowed Or;" borne by the name of *Nathiley*. Adders, snakes, and serpents are said to represent many things, which being according to the fancy of the ancients, and a few modern authors who have adopted their opinions, it is needless to enlarge upon. It is certain they often occur in armory; but the noblest is that of the duchy of Milan, viz. "Argent, a Serpent gliding in Pale Azure, crowned Or, vorant an Infant issuing Gules." The occasion of this bearing was this: Otho, first viscount of Milan,

Reptiles,
Plants, &c.

going to the Holy Land with Godfrey of Bouillon, defeated and slew in single combat the great giant Volux, a man of an extraordinary stature and strength, who had challenged the bravest of the Christian army. The viscount having killed him, took his armour, and among it his helmet, the crest whereof was a serpent swallowing an infant, worn by him to strike terror into those who should be so bold as to engage him.

17. "Ermine, a Rose Gules barbed and seeded proper;" borne by Boscawen viscount Falmouth, &c. This noble lord is descended from Richard Boscawen, of the town of Boscawen, in the county of Cornwall, who flourished in the reign of king Edward VI. Hugh, the first peer of this ancient family, was created baron of Boscawen-Rose, and viscount Falmouth, on the 13th of June 1720, 6th of George I.

18. "Azure, three Laurel-leaves slipped Or;" borne by the name of *Leveson*, and quartered by the right hon. Granville-Leveson Gower, earl of Gower, &c.

19. "Azure, three Garbs Or;" borne by the name of *Cuming*. These are sheaves of wheat; but though they were barley, rye, or any other corn whatsoever, it is sufficient, in blazoning, to call them *Garbs*, telling the tincture they are of.

20. "Gules, three Cinquefoils Argent;" borne by Lambart, baron of Cavan, &c. in Ireland. Of this ancient family, which is of French extraction, was Sir Oliver, who, in the reign of queen Elizabeth, attending the earl of Essex to Spain, was there knighted by him, and afterwards returning with that earl into Ireland, was, for his singular service in the north against O'Neal earl of Tyrone, made camp-master general, and president of Connaught; and February 17. 1617, was created lord Lambart and baron of Cavan by king James I.

It must be observed, that trees and plants are sometimes said to be trunked, eradicated, fructuated, or raguled, according as they are represented in arms.

ART. 2. OF ARTIFICIAL FIGURES borne in Coats of Arms.

AFTER the various productions of nature, artificial figures, the objects of arts and mechanics, claim the next rank. They may be distributed into the following classes, *viz.*

Warlike instruments; as swords, arrows, battering-rams, gauntlets, helmets, spears, pole-axes, &c.

Ornaments used in royal and religious ceremonies; as crowns, coronets, mitres, wreaths, croziers, &c.

Architecture; as towers, castles, arches, columns, plummets, battlements, churches, portcullisses, &c.

Navigation; as ships, anchors, rudders, pendants, sails, oars, masts, flags, galleys, lighters, &c.

All these bearings have different epithets, serving either to express their position, disposition, or make: *viz.* swords are said to be erect, pommeled, hilted, &c.; arrows, armed, feathered, &c.; towers, covered, embattled, &c.; and so on of all others, as will appear by the following examples.

Fig. 18.

1. "Sable, three Swords, their points meeting in the Base Argent, pommeled and hilted Or, a Crescent in chief of the second for difference;" borne by Powlet, duke of Bolton, &c. This noble duke is descended from Hercules, lord of Tournon in Picardy, who came over to England with Jeffrey Plantagenet earl of Anjou, third son of king Henry II. and among other lands had the

lordship of Paulet in Somersetshire conferred on him. William Powlet, the first peer of this illustrious and loyal family, was treasurer of the household to king Henry VIII. and by him created baron St John of Basing, in the county of Southampton, March 9. 1538.

2. "Argent, three Battering-rams barways in Pale, headed Azure and hooped Or, an Annulet for difference;" borne by Bertie, earl of Abington, &c. The first of the family of Bertie that bore the title of earl of Abington was James Bertie lord Norris of Rycote, being created earl, November 30. 1682, by Charles II.

3. "Azure, three left-hand Gauntlets with their backs forward Or;" borne by Fane, earl of Westmoreland, &c. This noble earl is descended from the Fanes, an ancient family which resided at Badfal in Kent, from which descended Francis Fane, son and heir of Sir Thomas Fane, knight, by Mary his wife, sole daughter and heiress to Henry Nevil lord Abergavenny, afterwards created baroness Despenser. The said Francis was a knight of the bath; and in the reign of king James I. was created baron Burghersh and earl of Westmoreland December 29. 1624.

4. "Azure, three Arrows their points in base Or;" borne by Archer, lord Archer, &c. This noble lord is descended from John de Archer, who came over from Normandy with William the Conqueror; and this family is one of the most ancient in Warwickshire, being settled at Umberlade in that county ever since the reign of Henry II. His lordship is the first peer; and was created lord Archer and baron of Umberlade by king George II. July 14. 1747.

5. "Gules, two Helmets in chief proper, garnished Or, in a Base of a Garb of the third;" borne by Cholmondeley, earl of Cholmondeley, &c. This noble earl is descended from the ancient family of Egerton in Cheshire, which flourished in the time of the conquest, from whom also the duke of Bridgewater is descended. The first English peer of this branch was Hugh viscount Cholmondeley of Kells, in Ireland, who, joining with those who opposed the arbitrary measures of king James II. was on the accession of king William and queen Mary created lord Cholmondeley of Nampt-wich, in the county of Chester.

6. "Argent, a Ship with its Sails furled up Sable;" quartered by Hamilton, earl of Abercorn, &c. The descent of this noble family is from that of the duke of Hamilton: for James, the fourth lord Hamilton and second earl of Arran, marrying lady Margaret Douglas daughter of James the third earl of Morton, by her had four sons, James, John, Claud, and David; whereof Claud was progenitor of the lord we are now speaking of; and in consideration of his merit and loyalty to Mary queen of Scots, James VI. created him lord Paisley in 1591, as also earl of Abercorn, baron of Hamilton, &c. July 10. 1606.

7. "Or, an Anchor in pale Gules;" quartered by the most noble George Johnston, marquis of Annandale, &c. The Johnstons are an ancient and warlike family, and derive their surname from the barony of Johnston in Annandale.

8. "Sable, three Spears heads erect Argent, imbrued Gules, on a chief Or, as many Pole-axes Azure;" borne by King, lord King, &c. Peter King, Esq; the first lord of this ancient family, was chosen recorder of the city of London, July 27. 1708, and on the 12th of September

September following had the honour of knighthood conferred on him. He was constituted lord-chief-justice of the common-pleas in the first year of king George I. 1714; on the 5th of April following was sworn of his majesty's most hon. privy council; and on May 19. 1723, was created a peer of this kingdom by the title of lord King, baron of Ockham.

9. "Gules, three Clarions Or;" quartered by Carteret, earl of Granville, &c. This ancient and worthy family derives its pedigree from Offerey de Carteret, who attended William the Conqueror in his descent upon England, and contributed to the victory he obtained over king Harold, at Hastings in Suffex, 1066, he had manors and lands in England conferred on him by that prince, as a reward for his eminent services. George the first earl was, in consideration of his own merit and the services of his ancestors, created a peer of Great Britain, October 19. 1681.

10. "Argent, a Maunch Sable;" borne by Hastings, earl of Huntingdon, &c. The present noble earl is descended from Hugh de Hastings, a younger son of the ancient and noble family of the Hastings, earl of Pembroke, of which family was William de Hastings, steward of the household to king Henry I.—William, the first lord Hastings, was created a baron on July 6. 1461, by king Edward IV.

11. "Azure, a circular Wreath Argent and Sable, with four Hawk's Bells joined thereto in quadrature Or;" borne by Jocelyn, viscount Jocelyn, &c. This noble family is of great antiquity; for, after the Romans had been masters of Britain 500 years, wearied with the wars, they took their final farewell of it, and carried away with them a great many of their brave old British soldiers, who had served them in their wars both at home and abroad, to whom they gave Amorica in France, for their former services, which country was from them afterwards called *Little Britain*. It is supposed that there were some of this family amongst them; and that they gave the name of *Jocelyn* to a town in this country, which still preserves that name: and it is thought probable that they returned with William the Conqueror; for we find, in 1066, mention made of Sir Gilbert Jocelyn. This present nobleman, the first lord of the family, was created baron Newport, of Newport in Ireland, on November 29. 1743, and viscount in November 1751.

12. "Gules, three Towers Argent;" quartered by Fowler, viscount Ashbrook, &c. William Fowler, Esq; was advanced to the peerage by king George II. and created baron of Castle-Durrow, in the county of Kilkenny, October 27. 1733; and his son was created viscount Ashbrook, of Ashbrook in Ireland, on Sept. 30. 1751, now extinct.

13. "Gules, two Keys in Saltier Argent, in Chief a Royal Crown proper;" the arms of the archbishopric of York.

14. "Gules, two Swords in Saltier Argent, pommel and hilted Or;" the arms of the bishopric of London.

15. "Sable, a Key in Bend, surmounted by a Crozier in Bend sinister, both Or;" the arms of the bishopric of St Asaph.

16. "Gules, two Keys adossée in Bend, the uppermost Argent, the other Or, a Sword interposed

between them in Bend-sinister of the second, pommel and hilted of the third;" the arms of the bishopric of Winchester.

17. "Gules, three Mitres with their pendants Or;" the arms of the bishopric of Chester.

18. "Sable, three Ducal Coronets paleways Or;" the arms of the bishopric of Bristol.

19. "Gules, a Sword erect in pale Argent, pommel and hilted Or, surmounted by two Keys in Saltier of the last;" the arms of the bishopric of Exeter.

20. "Gules, three Ducal Coronets, Or;" the arms of the bishopric of Ely.

ART. III. OF CHIMERICAL FIGURES.

THE last and the oddest kind of bearings in coats of arms, is comprehended under the name of *chimerical figures*; that is to say, such as have no real existence, but are mere fabulous and fantastical inventions. These charges, griffons, martlets, and unicorns excepted, are so uncommon in British coats, that in order to make up the same number of examples hitherto contained in each collection, several foreign bearings are introduced here; which, however, as they are conform to the laws of heraldry, will also contribute both to entertain and instruct the reader. Those most in use are the following, viz.

Angels, Cherubims, Tritons, Centaurs, Martlets, Griffons, Unicorns, Dragons, Mermaids, Satyrs, Wiverns, Harpies, Cockatrices, Phenixes.

These, like the foregoing charges, are subject to various positions and dispositions, which, from the principles already laid down, will be plainly understood. See the examples, fig. xix.

Nº 1. is "Gules, an Angel standing affrontée, with his hands conjoined and elevated upon his breast, habited in a long Robe close girt Argent, his Wings displayed Or;" borne by the name of *Brangor de Cerevisia*, a foreign prelate, who assisted at the council of Constance, 1412. This example is quoted by Guillim, Sect. III. Chap. i.

2. "Sable, a Cheveron between three Cherubim Or;" borne by the name of *Chaloner*, of Yorkshire and Cheshire.

3. "Azure, a Fess indented between three Cherubim Argent." These arms were granted to John Ayde, Esq; of Doddington in Kent, by Sir William Segar, garter.

4. "Gules, a Cherub having three pair of Wings, the uppermost and lowermost counter-crossed Saltierways, and the middlemost displayed Argent;" borne by the name of *Buocafoco*, a foreign prelate. This example is copied from Menestrier's *Methode du Blason*, p. 120, Nº viii.

5. "Azure, a Griffon segreant Or, armed and langued Gules, between three Crescents Argent;" quartered by Bligh, lord Clifton, &c. The ancestor of this noble family, who lived in London, going over to Ireland in the time of Oliver Cromwell, as an agent to the adventurers there, acquired a good estate, and laid the foundation for the grandeur of this family.

6. "Gules, three Martlets Or;" borne by the name of *Macgill*. Guillim observes, that this bird, which is represented without feet, is given for a difference to younger brothers, to put them in mind, that, in order

Chimerical
Figures.

Chimerical
Figures.

to raise themselves, they are to trust to their wings of virtue and merit, and not to their legs, having but little land to set their feet on.

7. "Azure, three Mulletts Argent within a double Tressure counter-flowery Or, in the centre a Martlet of the last;" borne by Murray, lord Elibank. Sir Gideon Murray, knighted by king James VI. by whom he was made treasurer-depute, was third son of Sir Andrew Murray of Blackbarony. His son Patrick, in respect of his loyalty to Charles I. was on May 16. 1628 made a baronet, and in 1643 created lord Elibank.

8. "Sable, a Cockatrice displayed Argent, crested, membreed, and jowlopped Gules."

9. "Argent, a Mermaid Gules, crined Or, holding in her right hand a Comb, and in her left a Mirror, both proper;" borne by the name of *Ellis*.

10. "Argent, a Wivern, his Wings elevated, and his Tail nowed below him Gules;" borne by the name of *Drakes*.

11. "Or, a Dragon passant Vert."

12. "Gules, a Centaur or Sagittary in full speed regardant proper." This was the coat of arms of Stephen furnamed of *Blois*, son to Adela daughter of William the Conqueror, and of Stephen earl of Blois; and on this descent grounding his pretension to the crown of England, he was proclaimed king in 1135, and reigned to the 25th of October 1154.

13. "Argent, an Unicorn sejant Sable, unguled and horned Or;" borne by the name of *Harling*.

14. "Argent, a Dragon's Head erased Vert, holding in his Mouth a sinister Hand coupé at the Wrist Gules;" borne by the name of *Williams*.

15. "Gules, three Unicorns Heads coupé Or;" borne by the name of *Paris*.

16. "Argent, a Wivern volant Bendways Sable;" borne by the name of *Raynon*.

17. "Azure, a Lion sejant guardant winged Or, his Head encircled with a Glory, holding in his forepaws an open Book, wherein is written, *Pax tibi, Marce, Evangelista meus*; over the dexter side of the Book a Sword erect, all proper." These are the arms of the republic of Venice.

18. "Azure, a Bull saliant and winged Or;" borne by the name of *Cadenet*, a family of distinction of Provence.

19. "Argent, a Wivern with a human Face affrontée hooded, and winged Vert;" borne by the name of *Busenaghi*, an ancient and noble family of Luques.

20. "Azure, a Harpy displayed, armed, crined, and crowned Or." These are the arms of the city of Noremberg in Germany.

To the forementioned figures may be added the *montégre*, an imaginary creature, supposed to have the body of a tyger with a satyr's head and horns; also those which have a real existence, but are said to be endowed with extravagant and imaginary qualities, viz. the salamander, beaver, cameleon, &c.

C H A P. IV.

Of the EXTERNAL ORNAMENTS of ESCUTCHEONS.

The ornaments that accompany or surround escutcheons were introduced to denote the birth, dignity,

or office, of the persons to whom the coat-of-arms appertaineth; which is practised both among the laity and clergy. Those most in use are of ten sorts, viz. Crowns, Coronets, Mitres, Helmets, Mantlings, Chapeaux, Wreaths, Crests, Scrolls, Supporters.

SECT. I. Of Crowns.

THE first crowns were only diadems, bands, or fillets; afterwards they were composed of branches of divers trees, and then flowers were added to them.

Among the Greeks, the crowns given to those who carried the prize at the Isthmian games, were of pine; at the Olympick, of laurel; and at the Nemean, of smillage.

The Romans had various crowns to reward martial exploits and extraordinary services done to the republic; for which see the detached article CROWN in this Dictionary, and Plate CL.

Examples of some of these crowns are frequently met with in modern achievements, viz. 1. The *mural* crown in that of lord Montfort, which was conferred on Sir John Bromley, one of his lordship's ancestors, as an augmentation to his arms, for his great courage at the battle of Le Crobey. Part of the crest of lord Archer is also a mural crown. And there are no less than ten English baronets, whose arms are ornamented with the same crown. 2. The *naval* or rostral crown is still used with coats-of-arms, as may be seen in those of Sir William Burnaby, bart. now admiral of the red squadron, and of John Clerke, Esq; as part of their crests. 3. Of the *castrense* or vallery crown, we have instances in the coat-of-arms of Sir Reginald Graham, and of Isaac Akerman, Esq. 4. The crest of Grice Blackney, Esq; is encompassed with a *civic* crown. 5. The *radiated* crown, according to J. Yorke, was placed over the arms of the kings of England, till the time of Edward III. It is still used as a crest on the arms of some private families; those, for example, borne by the name of *Whitfield*, are ornamented with it. The celestial crown is formed like the radiated, with the addition of a star on each ray; and is only used upon tomb-stones, monuments, and the like.—Others of the ancient crowns are still borne, as crests, by several families.

But modern crowns are only used as an ornament, which emperors, kings, and independent princes set on their heads, in great solemnities, both to denote their sovereign authority, and to render themselves more awful to their subjects. These are the most in use in heraldry, and are as follows:

The imperial crown (n^o 1.), is made of a circle of gold, adorned with precious stones and pearls, height-^{Plate} CCXXXII. ened with fleurs-de-lis, bordered and seeded with pearls, fig. 20. raised in the form of a cap voided at the top, like a crescent. From the middle of this cap rises an arched fillet enriched with pearls, and surmounted of a mound, whereon is a cross of pearls.

The crown of the kings of Great Britain (2.) is a circle of gold, bordered with ermine, enriched with pearls and precious stones, and heightened up with four crosses pattee and four large fleurs-de-lis alternately; from these rise four arched diadems adorned with pearls, which close under a mound, surmounted of a cross like those at bottom. Mr Sandford, in his Genealogical History, p. 381. remarks, that Edward

Crowns.

Coronets.

ward IV. is the first king of England that in his seal, or on his coin, is crowned with an arched diadem.

The crown of the kings in France (3.) is a circle enamelled, adorned with precious stones, and heightened up with eight arched diadems, rising from as many fleurs-de-lis, that conjoin at the top under a double fleur-de-lis, all of gold.

The crowns of Spain, Portugal, and Poland, are all three of the same form, and are, amongst others, thus described by colonel Parsons, in his Genealogical Tables of Europe, viz. A ducal coronet, heightened up with eight arched diadems that support a mound, ensigned with a plain cross. Those of Denmark and Sweden are both of the same form; and consist of eight arched diadems, rising from a marquis's coronet, which conjoin at the top under a mound ensigned with a cross-bottony.

The crowns of most other kings are circles of gold, adorned with precious stones, and heightened up with large trefoils, and closed by four, six, or eight diadems, supporting a mound, surmounted of a cross.

The Great Turk (4) bears over his arms a turband, enriched with pearls and diamonds, under two coronets, the first of which is made of pyramidal points heightened up with large pearls, and the uppermost is surmounted with crescents.

The Pope, or bishop of Rome, appropriates to himself a Tiara (n° 5.), or long cap of golden cloth, from which hang two pendants embroidered and fringed at the ends, *semée* of crosses of gold. This cap is inclosed by three marquis's coronets; and has on its top a mound of gold, whereon is a cross of the same, which cross is sometimes represented by engravers and painters pometted, recrossed, flowery, or plain.—It is a difficult matter to ascertain the time when these haughty prelates assumed the three forementioned coronets. A patched up succession of the holy pontiffs, engraved and published a few years ago by order of Clement XIII. the late Pope, for the edification of his good subjects in Great Britain and Ireland, represents Marcellus, who was chosen bishop of Rome anno 310, and all his successors, adorned with such a cap: but it appears, from very good authority, that Boniface VIII. who was elected into the see of Rome anno 1295, first compassed his cap with a coronet; Benedict XII. in 1335, added a second to it; and John XXIII. in 1411, a third; with a view to indicate by them, that the Pope is the sovereign priest, the supreme judge, and the sole legislator amongst Christians.

SECT. II. Of Coronets.

THE Coronet of the prince of Wales, or eldest son of the king of Great Britain (n° 7.), was anciently a circle of gold set round with four crosses-patee, and as many fleurs-de-lis alternately; but since the restoration, it has been closed with one arch only, adorned with pearls, and surmounted of a mound and cross, and bordered with ermine like the king's.

Besides the aforesaid coronet, his royal highness the prince of Wales has another distinguishing mark of honour, peculiar to himself, called by the vulgar the *prince's arms*, viz. A plume of three ostrich-feathers, with an ancient coronet of a prince of Wales. Under it, in a scroll, is this motto, *Ich Dien*, which in the

German or old Saxon language signifies "I serve;" (see n° 6). This device was at first taken by Edward prince of Wales, commonly called the *black prince*, after the famous battle of Cressy, in 1346, where having with his own hand killed John king of Bohemia, he took from his head such a plume, and put it on his own.

The coronet of all the immediate sons and brothers of the kings of Great Britain, is a circle of gold, bordered with ermine, heightened up with four fleurs-de-lis, and as many crosses-patee alternate, (see n° 8).—The particular and distinguishing form of such coronets as are appropriated to princes of the blood-royal, is described and settled in a grant of Charles II. the 13th of his reign.

The coronet of the princesses of Great Britain is a circle of gold, bordered with ermine, and heightened up with crosses-patee, fleurs-de-lis, and strawberry leaves alternate (n° 9.); whereas a prince's coronet has only fleurs-de-lis and crosses.

A duke's coronet is a circle of gold bordered with ermine, enriched with precious stones and pearls, and set round with eight large strawberry or parsley leaves; (n° 10).

A marquis's coronet is a circle of gold, bordered with ermine, set round with four strawberry leaves, and as many pearls on pyramidal points of equal height, alternate; (n° 11).

An earl's coronet is a circle of gold, bordered with ermine, heightened up with eight pyramidal points or rays, on the tops of which are as many large pearls, and are placed alternately with as many strawberry-leaves, but the pearls much higher than the leaves; (n° 12).

A viscount's coronet differs from the preceding ones as being only a circle of gold bordered with ermine, with large pearls set close together on the rim, without any limited number, which is his prerogative above the baron, who is limited; (see n° 13).

A baron's coronet, (n° 14), which was granted by king Charles II. is formed with six pearls set at equal distance on a gold circle, bordered with ermine, four of which only are seen on engravings, paintings, &c. to show he is inferior to the viscount.

The eldest sons of peers, above the degree of a baron, bear their father's arms and supporters with a label, and use the coronet appertaining to their father's second title; and all the younger sons bear their arms with proper differences, but use no coronets.

As the crown of the king of Great Britain is not quite like that of other potentates, so do most of the coronets of foreign noblemen differ a little from those of the British nobility: as for example, the coronet of a French earl is a circle of gold with 18 pearls set on the brim of it; a French viscount's coronet is a circle of gold only enamelled, charged with four large pearls; and a French baron's coronet is a circle of gold enamelled and bound about with a double bracelet of pearls: and these coronets are only used on French noblemens coats-of-arms, and not worn on their heads, as the British noblemen and their ladies do at the king's coronation.

SECT. III. Of Mitres.

THE archbishops and bishops of England and Ireland

Helmets. land place a mitre over their coats-of-arms. It is a round cap pointed and cleft at the top, from which hang two pendants fringed at both ends; with this difference, that the bishop's mitre is only surrounded with a fillet of gold, set with precious stones, (see fig. 23. n° 6). whereas the archbishop's issues out of a ducal coronet, see fig. 20. n° 15).

This ornament, with other masquerade garments, is still worn by all the archbishops and bishops of the church of Rome, whenever they officiate with solemnity; but it is never used in England, otherwise than on coats-of-arms, as before mentioned.

SECT. IV. *Of Helmets.*

THE Helmet was formerly worn as a defensive weapon, to cover the bearer's head; and is now placed over a coat-of-arms as its chief ornament, and the true mark of gentility. There are several sorts, distinguished, 1st, by the matter they are made of; 2dly, by their form; and, 3dly, by their position.

1st, As to the matter they are, or rather were, made of: The helmets of sovereigns were of burnished gold damasked; those of princes and lords, of silver figured with gold; those of knights, of steel adorned with silver; and those of private gentlemen, of polished steel.

2dly, As to their form: Those of the king and the royal family, and noblemen of Great Britain, are open-faced and grated, and the number of bars serves to distinguish the bearers quality; that is, the helmet appropriated to the dukes and marquises is different from the king's, by having a bar exactly in the middle, and two on each side, making but five bars in all, (see fig. 21. n° 1). whereas the king's helmet has six bars, viz. three on each side, (ibid. n° 7.) The other grated helmet with four bars is common to all degrees of peerage under a marquis. The open-faced helmet without bars denotes baronets and knights. The close helmet is for all esquires and gentlemen.

3dly, Their position is also looked upon as a mark of distinction. The grated helmet in front belongs to sovereign princes. The grated helmet in profile is common to all degrees of peerage. The helmet standing direct without bars, and the beaver a little open, denotes baronets and knights. Lastly, the side-standing helmet, with the beaver close, is the way of wearing it amongst esquires and gentlemen. See n° 1, 2, 3, 4, and 7, inserted in fig. 21. *Ornaments.*

SECT. V. *Of Mantlings.*

MANTLINGS are pieces of cloth jagged or cut into flowers and leaves, which now-a-days serve as an ornament for escutcheons. They were the ancient coverings of helmets, to preserve them, or the bearer, from the injuries of the weather, as also to prevent the ill consequences of their too much dazzling the eye in action. But Guillim very judiciously observes, that their shape must have undergone a great alteration since they have been out of use, and therefore might more properly be termed *flourishings* than *mantlings*. See the examples annexed to the helmets represented in fig. 21.

The French heralds assure us, that these mantlings were originally no other than short coverings which commanders wore over their helmets, and that, going

N° 152.

into battles with them, they often, on their coming away, brought them back in a ragged manner, occasioned by the many cuts they had received on their heads: and therefore the more hacked they were, the more honourable they were accounted; as our colours in time of war are the more esteemed for having been shot through in many places.

Sometimes skins of beasts, as lions, bears, &c. were thus borne, to make the bearer look more terrible; and that gave occasion to the doubling of mantlings with furs.

SECT. VI. *Of Chapeaux.*

A CHAPEAU is an ancient hat, or rather cap, of dignity worn by dukes, generally scarlet-coloured velvet on the outside, lined and turned up with fur; of late frequently to be met with above an helmet, instead of a wreath, under gentlemens and noblemens crests. Heretofore they were seldom to be found, as of right appertaining to private families; but by the grants of Robert Cooke, Clarencieux, and other succeeding heralds, these, together with ducal coronets, are now frequently to be met with in families, who yet claim not above the degree of gentlemen. See the representation of the chapeau, n° 5. fig. 21.

SECT. VII. *Of Wreaths.*

THE Wreath is a kind of roll made of two skains of silk of different colours twisted together, which ancient knights wore as a head-dress when equipped for tournaments. The colours of the silk are always taken from the principal metal and colour contained in the coat-of-arms of the bearer. They are still accounted as one of the lesser ornaments of escutcheons, and are placed between the helmet and the crest; (see fig. 21. n° 6). In the time of Henry I. and long after, no man, who was under the degree of a knight, had his crest set on a wreath; but this, like other prerogatives, has been unfringed so far, that every body now-a-days wears a wreath.

SECT. VIII. *Of Crests.*

THE Crest is the highest part of the ornaments of a coat-of-arms. It is called *crest*, from the Latin word *crisla*, which signifies comb or tuft, such as many birds have upon their heads, as the peacock, pheasant, &c. in allusion to the place on which it is fixed.

Crests were formerly great marks of honour, because they were only worn by heroes of great valour, or by such as were advanced to some superior military command, in order that they might be the better distinguished in an engagement, and thereby rally their men if dispersed; but they are at present considered as a mere ornament. The crest is frequently a part either of the supporters, or of the charge borne in the escutcheon. Thus the crest of the royal achievement of Great Britain is a "Lion guardant crown'd," as may be seen in fig. 21. n° 7. The crest of France is a double Fleur-de-luce." Out of the many crests borrowed from supporters, are the following, viz. The duke of Montagu's, "A Griffon's head coup'd Or, back'd and wing'd Sable;" the marquis of Rockingham's, "A Griffon's head argent, gorg'd with a ducal coronet;" the earl of Westmoreland's; "A Bull's head Argent, py'd Sable, armed Or; and lord Archer's

Of the
Scroll, &c.

Archer's, which is, "Out of a mural crown Or, a Wyvern's head Argent." There are several instances of crests that are relative to alliances, employments, or names; and which on that account have been changed.

SECT. IX. *Of the Scroll.*

THE Scroll is the ornament placed above the crest, containing a motto, or short sentence, alluding thereto, or to the bearings; or to the bearer's name, as in the two following instances. The motto of the noble earl of Cholmondeley is, *Cassis tutissima virtus*; i. e. "Virtue is the safest helmet;" on account of the helmet in the coat of arms. The motto of the right hon. lord Fortescue is, *Forte scutum salus ducum*; i. e. "A strong shield is the safety of the commanders;" alluding to the name of that ancient family. Sometimes it has reference to neither, but expresses something divine or heroic; as that of the earl of Scarborough, which is, *Murus æreus conscientia sana*; i. e. "A good conscience is a wall of brass." Others are ænigmatical; as that of the royal achievement, which is *Dieu et mon droit*, i. e. "God and my right;" introduced by Edward III. in 1340, when he assumed the arms and title of *king of France*, and began to prosecute his claim, which occasioned long and bloody wars, fatal, by turns, to both kingdoms: or that of the prince of Wales, which is *Ich Dien*, "I serve," the origin of which has been already mentioned. Mottos, though hereditary in the families that first took them up, have been changed on some particular occasions, and others appropriated in their stead, instances of which are sometimes met with in the history of families.

SECT. X. *Of Supporters.*

SUPPORTERS are figures standing on the scroll, and placed at the side of the escutcheon; they are so called, because they seem to support or hold up the shield. The rise of supporters is, by F. Menestrier, traced up to ancient tournaments, wherein the knights caused their shields to be carried by servants or pages under the disguise of lions, bears, griffons, blackamoors, &c. who also held and guarded the escutcheons, which the knights were obliged to expose to public view for some time before the lists were opened. Sir George Mackenzie, who dissents from this opinion, says, in his *Treatise on the science of heraldry*, chap. xxxi. p. 93. "That the first origin and use of them was from the custom which ever was, and is, of leading such as are invested with any great honour to the prince who confers it: thus, when any man is created a duke, marquis, or knight of the garter, or any other order, he is supported by, and led to the prince betwixt, two of the quality, and so receives from him the symbols of that honour; and in remembrance of that solemnity, his arms are thereafter supported by any two creatures he chooses." Supporters have formerly been taken from such animals or birds as are borne in the shields, and sometimes they have been chosen as bearing some allusion to the names of those whose arms they are made to support. The supporters of the arms of Great Britain, since king James the first's accession to the throne, are a *Lion rampant guardant crowned Or*, on the dexter side, and an *Unicorn Argent*, crowned, armed, unguled, maned and gorged with an an-

Of
Supporters.

tique Crown, to which a chain is affixed, all Or, on the sinister; as it appears by fig. xxi. n° 7.

This last figure represents the coat-of-arms of the king of Great Britain, or the royal achievement, as it has been marshalled since the accession of king George I. in 1714, and is blazoned as follows, viz.

ARMS. Quarterly, in the first grand quarter Gules, three Lions rampant guardant in pale Or, the imperial ensigns of England; impaled with Or, a Lion rampant, within a double tressure flowery and counter-flowery Gules, the royal arms of Scotland. The second is Azure, three Fleurs-de-lis Or, the arms of France. The third is Azure, a Harp Or, stringed Argent, the ensign of Ireland. The fourth grand quarter is Gules, two Lions passant guardant in pale Or, for Brunswick; impaled with Or semee of Hearts proper, a Lion rampant Azure, for Lünenburgh; with grafted in base Gules, a Horse current Argent, for ancient Saxony; and in a shield surmount Gules, the Crown of Charlemagne Or, as arch-treasurer of the empire; the whole within a Garter, inscribed with this motto, *HONI SOIT QUI MAL Y PENSE*, as sovereign of that noble order, given by the founder king Edward III.

CREST. On a Helmet full-faced, grated and surmounted of a Crown, a Lion guardant crowned Or; the mantlings of the last, and lining Ermine.

SUPPORTERS. On the Dexter side a Lion rampant guardant Or, crowned as the Crest. On the Sinister side an Unicorn Argent, crowned, armed, maned, and unguled Or, gorged with an antique Crown; a Chain affixed thereto, reflecting over the back, and passing over the hind legs of the last, both standing on a Scroll inscribed with this motto, *DIEU ET MON DROIT*, from which issue the two Royal Badges of his Majesty's chief Dominions, viz, on the Dexter side a Rose party per Pale Argent and Gules, stalked and leaved proper for England; and on the Sinister side a Thistle proper, for Scotland; being so adorned by king James I. upon his succeeding to the Crown of England. As king of Scotland, he bore two unicorns, as above, for his supporters; but upon the union of that kingdom with England, 1603, he introduced one of the above supporters on the sinister side of the royal achievement, and which continues to this day.

It is to be observed, that bearing coats-of-arms supported, is, according to the heraldical rules of England, the prerogative, 1st, Of those called *nobiles majores*, viz. dukes marquises, earls, viscounts, and barons; 2d, Of all knights of the garter, though they should be under the degree of barons; 3d, Of knights of the Bath, who both receive on their creation a grant of supporters. And, lastly, of such knights as the king chooses to bestow this honour upon; as in the instance of Sir Andrew Fountain, who was knighted by Philip earl of Pembroke, when lord-lieutenant of Ireland, Fountain being then his secretary; and on his return to England, king William granted him supporters to his arms, viz. *two Griffons Gules and Or*. In Scotland, all the chiefs of clans or names have the privilege of claiming supporters; also the baronets. But by act of parliament, 10th September 1672, none are allowed to use either arms or supporters, under a penalty and confiscation of all moveables whereon arms are put, without the lord Lyon's authority.

Of the Rules or Laws of HERALDRY.

THE several escutcheons, tinctures, charges, and ornaments of coats-of-arms, and their various properties, being now explained; it may not be improper to subjoin such rules for blazoning the same, as the ancient usage and laws of heraldry have established amongst us.

I. The *first* and most general rule is, to express one's self in proper terms, so as not to omit any thing that ought to be specified, and at the same time to be clear and concise without tautology; as in Ex. xiv. p. 446. and also in Ex. ix. p. 453. wherein these expressions, *of the Field*, or *of the First*, prevent the repetition of the forementioned tincture.

II. One must begin with the tincture of the field, and then proceed to the principal charges which possess the most honourable place in the shield, such as Fefs, Cheveron, &c. always naming that charge first which lies next and immediately upon the field; as in Ex. xv. p. 451.

III. After naming the tincture of the field, the honourable ordinaries, or other principal figures, you must specify their attributes, and afterwards their metal or colour, as in Ex. xvi. p. 458.

IV. When an honourable ordinary, or some one figure, is placed upon another, whether it be a Fefs, Cheveron, Cross, &c. it is always to be named after the ordinary or figure over which it is placed, with one of these expressions, *surtout*, or *over all*, as in Example xx. p. 449.

V. In the blazoning of such ordinaries as are plain, the bare mention of them is sufficient; but if an ordinary should be made of any of the crooked lines mentioned above, its form must be specified; that is, whether it be Engrailed, Wavy, &c. as in Ex. i. ii. iii. &c. p. 446.

VI. When a principal figure possesses the centre of the field, its position is not to be expressed: or (which amounts to the same thing) when a bearing is named, without specifying the point where it is placed, then it is understood to possess the middle of the shield; as in Ex. xv. p. 459.

VII. The number of the points of mullets or stars must be specified when more than five; and also if a mullet or any other charge be pierced, it must be mentioned as such, to distinguish it from what is plain; as in Ex. xiii. and xiv. p. 457.

VIII. When a ray of the sun, or other single figure, is borne in any other part of the escutcheon than the centre, the point it issues from must be named; as in Ex. iii. p. 457. col. 1.

IX. The natural colour of trees, plants, fruits, birds, &c. is no otherwise to be expressed in blazoning but by the word *proper*, as in Exam. ii. vii. p. 459: but if discoloured, that is, if they differ from their natural colour, it must be particularized; as in Ex. i. ii. &c. p. 458.

X. When three figures are in a field, and their position is not mentioned in the blazoning, they are always understood to be placed two above, and one below; as fig. xxii. n^o 3.

XI. When there are many figures of the same species borne in a coat-of-arms, their number must be

observed as they stand, and distinctly expressed; as in Marshal-
ling. Ex. i. p. 460.

But for the better understanding of this last rule, we have inserted examples of the *different dispositions of figures*, wherein they are properly represented; viz.

Two may be ranged in Pale, in Fefs, &c. See fig. xxii. n^o 1 and 2.

Three, may be 2 and 1, as also in bend, &c. See n^o 3 and 4.

Four, are placed 2 and 2, or cantoned, as in n^o 5.

Five, 1, 3, 1, in Cross; or 2, 1, 2, in Saltier. See n^o 6 and 7.

Six, 3, 2, 1, in Pile; or 2, 2, 2, Paleways. See n^o 8 and 9.

Eight, in Orle, or on a Bordure. See n^o 10.

Nine, 3, 3, 3, Barways; or 3, 3, 2, 1, in Pile. See n^o 11 and 12.

Ten, 4, 3, 2, 1, in Pile; or else 4, 2, 4, Barways. See n^o 13 and 14.

Twelve, are placed 4, 4, 4, Barways. See n^o 15.

There are other positions called *irregular*; as for example, when three figures which are naturally placed 2 and 1, are disposed 1 and 2, &c. It must also be observed, that when the field is strewn with the same figures, this is expressed by the word *semée*: but, according to a French armorist's opinion, if the figures strewn on the field are whole ones, it must be denoted by the words *sans nombre*; whereas, if part of them is cut off at the extremities of the escutcheon, the word *semée* or *femi* is then to be used.

C H A P. VI.

Of MARSHALLING Coats-of-arms.

By *marshalling* coats-of-arms, is to be understood the art of disposing divers of them in one escutcheon, and of distributing their contingent ornaments in proper places.

Various causes may occasion arms to be thus conjoined, which J. Guillim comprises under two heads, viz. *manifest* and *obscure*.

What this learned and judicious herald means by *manifest causes* in the marshalling of coats-of-arms, are such as betoken marriages, or a sovereign's gift, granted either through the special favour of the prince, or for some eminent services. Concerning marriages it is to be observed.

I. When the coats-of-arms of a married couple, descended of distinct families, are to be put together in one escutcheon, the field of their respective arms is conjoined Paleways, and blazoned *parted per Pale, Baron and Femme, two coats; first, &c.* In which case the baron's arms are always to be placed on the dexter-side, and the femme's arms on the sinister-side, as in no 1 and 2, fig. xxiii. *Of arms marshalled*, which are,

1. The coat-of-arms of the rev. Edward Barnard, D. D. chaplain in ordinary to his majesty, provost of Eton-college, canon of Windsor, &c. impaled with that of S. Hagatt, his late spouse.

2. The coat-of-arms of the rev. Thomas Dampier, D. D. chaplain in ordinary to his majesty, prebendary of Durham, canon of Windsor, &c. impaled with that of F. Walker, his spouse.

If a widower marry again, his late and present wife's

Marshall-
ling.

wife's arms are, according to G. Leigh, "to be both placed on the sinister-side, in the escutcheon with his own, and parted per Pale. The first wife's coat shall stand on the Chief, and the second on the Base; or he may set them both in Pale with his own, the first wife's coat next to himself, and his second outermost. If he should marry a third wife, then the two first matches shall stand on the Chief, and the third shall have the whole Base. And if he take a fourth wife, she must participate one-half of the Base with the third wife, and so will they seem to be so many coats quartered." But it must be observed, that these forms of impaling are meant of hereditary coats, whereby the husband stands in expectation of having the hereditary possessions of his wife united to his patrimony.

II. In the arms of femmes joined to the paternal coat of the baron, the proper differences by which they were borne by the fathers of such women must be inserted.

III. If a coat-of-arms that has a Bordure be impaled with another, as by marriage, then the Bordure must be wholly omitted in the side of the arms next the centre.

Fig. xxiii.

IV. The person that marries an heiress, instead of impaling his arms with those of his wife, is to bear them in an escutcheon placed in the centre of his shield, after the same manner as the baronet's badge is marshalled in n° 3. and which, on account of its showing forth his pretension to her estate, is called *an escutcheon of pretence*, and is blazoned *surtout, i. e. over-all*, as in the escutcheon borne in the fourth quarter of the royal achievement. But the children are to bear the hereditary coat-of-arms of their father and mother *quarterly*, which denotes a fixed inheritance, and so transmit them to posterity. The first and fourth quarters generally contain the father's arms, and the second and third the mother's; except the heirs should derive not only their estate, but also their title and dignity, from their mother.

V. If a maiden or dowager lady of quality marry a commoner, or a nobleman inferior to her rank, their coats-of-arms may be set aside of one another in two separate escutcheons, upon one mantle or drapery, and the lady's arms ornamented according to her title; see n° 4 and 5, which represent the coats-of-arms of Gen. C. Montagu, and lady Elizabeth Villiers viscountess Grandison.

VI. Archbishops and bishops impale their arms differently from the fore-mentioned coats, in giving the place of honour, that is, the dexter-side, to the arms of their dignity, as it is expressed in n° 6, which represents the coat-of-arms of Dr Phillip Yonge, lord bishop of Norwich. It may be observed of the above prelates, that they thus bear their arms parted per Pale, to denote their being joined to their cathedral church in a sort of spiritual marriage.

With respect to such armorial ensigns as the sovereign thinks fit to augment a coat-of arms with, they may be marshalled various ways, as may be seen by the arms of his grace the duke of Rutland, inserted in fig. viii. n° 19. and the example contained in fig. xii. n° 11.

To those augmentations may be added, 1st, The baronet's mark of distinction, or the arms of the pro-

vince of Ulster in Ireland, granted and made hereditary in the male line by king James I. who erected this dignity on the 22d of May 1611, in the 9th year of his reign, in order to propagate a plantation in the fore-mentioned province. This mark is *Argent, a sinister Hand couped at the Wrist, and erected Gules*; which may be borne either in a canton, or in an escutcheon, as will best suit the figures of the arms. See fig. xxiii. n° 3. which represents the coat-of-arms of Sir William Lorrayne, of Kirk-harle, Northumberland, and are thus blazoned: *Quarterly, Sable and Argent, a plain Cross counter-quartered of the Field.* The Crest,—*A Laurel-tree couped, two branches sprouting out proper, and fixed to the lower part thereof with a Belt Gules, edged and buckled Or.* This, according to tradition in the family, was granted for some worthy action in the field.

2dly, The ancient and respectable badge of the most noble order of the Garter, instituted by king Edward III. 1349, in the 27th year of his reign; and which, ever since its institution, has been looked upon as a great honour bestowed on the noblest persons of this nation and other countries. This honourable augmentation is made to surround, as with a garter, the arms of such knights, and is inscribed with this motto, *Honi soit qui mal y pense*: See n° 7. which represents the coat-of-arms of his grace the duke of Montagu, earl of Cardigan, baron Brudenel of Stanton-Wivil, constable and lieutenant of Windsor-castle, knight of the most noble order of the Garter, and baronet, president of St Luke's Hospital, and F. R. S.

This nobleman, whose arms were *Argent, a Chevron Gules between three Morions proper*, has, since the decease of John duke of Montagu, taken the name and arms of *Montagu*, on account of his being married to lady Mary Montagu, youngest daughter and one of the co-heiresses of his grace.

So far the causes for marshalling divers arms in one shield, &c. are *manifest*. As to such as are called *obscure*, that is, when coats-of-arms are marshalled in such a manner, that no probable reason can be given why they are so conjoined, they must be left to heralds to explain, as being the properest persons to unfold these and other mysteries of this science.

C H A P. VII.

Of FUNERAL ESCUTCHEONS,

AFTER having treated of the essential parts of the coats-of-arms, of the various charges and ornaments usually borne therewith, of their attributes and dispositions, and of the rules for blazoning and marshalling them, we shall next describe the several funeral escutcheons, usually called *hatchments*; whereby may be known, after any person's decease, what rank either he or she held when living; and if it be a gentleman's hatchment, whether he was a bachelor, married man, or widower, with the like distinctions for gentlewomen.

The hatchment, N° 1. represents such as are affixed to the fronts of houses, when any of the nobility and gentry dies; the arms therein being those of a private gentleman and his wife parted per pale; the dexter-side, which is Gules, three Bars Or, for

Plate
CCXXXIII
fig. xxiv.

Of Escutcheons.

the husband; having the ground without the escutcheon black, denotes the man to be dead; and the ground on the sinister-side being white, signifies that the wife is living, which is also demonstrated by the small hatchment, n° 2. which is here depicted without mantling, helmet, and crest, for perspicuity's sake only.

When a married gentlewoman dies first, the hatchment is distinguished by a contrary colour from the former; that is, the arms on the sinister-side have the ground without the escutcheon black; whereas those on the dexter side, for her surviving husband, are upon a white ground: the hatchment of a gentlewoman is, moreover, differenced by a cherub over the arms instead of a crest. See n° 3.

When a bachelor dies, his arms may be depicted single or quartered, with a crest over them, but never impaled as the two first are, and all the ground without the escutcheon is also black. See n° 4.

When a maid dies, her arms, which are placed in a lozenge, may be single or quartered, as those of a bachelor; but, instead of a crest, have a cherub over them, and all the ground without the escutcheon is also black. See n° 5.

When a widower dies, his arms are represented impaled with those of his deceased wife, having a helmet, mantling, and crest over them, and all the ground without the escutcheon black. See n° 6.

When a widow dies, her arms are also represented impaled with those of her deceased husband, but inclosed in a lozenge, and, instead of a crest, a cherub is placed over them; all the ground without the escutcheon is also black. See n° 7.

If a widower or bachelor should happen to be the last of his family, the hatchment is depicted as in n° 6. and that of a maid or widow, whose family is extinct by her death, is depicted as in n° 7. with this difference only, that a death-head is generally annexed to each hatchment, to denote, that death has conquered all.

By the forementioned rules, which are sometimes neglected through the ignorance of illiterate people, may be known, upon the sight of any hatchment, what branch of the family is dead; and by the helmet or coronet, what title and degree the deceased person was of.

The same rules are observed with respect to the escutcheons placed on the hearse and horses used in pompous funerals, except that they are not surmounted with any crest, as in the foregoing examples of hatchments, but are always plain. It is necessary, however, to ensign those of peers with coronets, and that of a maiden lady with a knot of ribbands.

In *Scotland*, a funeral escutcheon not only shows forth the arms and condition of the defunct, but is also a proof of the gentility of his descent; and such persons for whom this species of escutcheon can be made out, are legally intitled to the character of gentleman of blood, which is the highest species of gentility. The English hatchment above described exhibits no more than a right to a coat-of-arms which may be acquired by purchase, and is only the first step towards establishing gentility in a family.

The funeral escutcheon, as exhibited in *Scotland*, *France*, and *Germany*, is in form of a lozenge, above six feet square, of black cloth; in the centre of which is painted, in proper colours, the complete achievement of the defunct, with all its exterior ornaments and additional marks or badges of honour; and round the sides are placed the sixteen arms of the families from which he derives his descent, as far back as the grandfather's grandfather, as the proofs of his gentility: they exhibit the armorial bearings of his father and mother, his two grandmothers, his four great-grandmothers, and his eight great-grandmothers mothers; if all these families have acquired a legal right to bear arms, then the gentility of the person whose proof it is must be accounted complete, but not otherwise. On the four corners are placed mort-heads, and the initials of his name and titles or designation; and the black interstices are semée or powdered with tears, as in the figure, n° 8. which is the escutcheon of the right hon. James 5th earl of Balcarra, chief of the ancient surname of *Lindesay*.

On the morning of the interment, one of these is placed on the front of the house where the deceased lies; and another on the church in which he is to be buried, which after the burial is fixed above the grave. The pall, too, is generally adorned with these proofs of gentility, and the horses of the hearse with the defunct's arms.

H E R

Heraldus.

HERALDUS (Desiderius), in French *Herault*, a counsellor of the parliament of Paris, has given good proofs of uncommon learning by very different works. His *Adversaria* appeared in 1599; which little book, if the *Scaligerana* may be credited, he repented the having published. His notes on Tertullian's Apology, on Minutius Felix, and on Arnobius, have been esteemed. He also wrote notes on Martial's Epigrams. He disguised himself under the name of *David Leidhefferus*, to write a political dissertation on the independence of kings, some time after the death of Henry IV. He had a controversy with Salmasius, *De jure Attico ac Romano*; but did not live to finish what he had written on that subject. What he had done,

H E R

however, was printed in 1650. He died in June 1649. *Heraldus* Guy Patin says, that "he was looked upon as a very learned man, both in the civil law and in polite literature, and wrote with great facility on any subject he pitched on." Daille, speaking of such Protestant writers as condemned the executing of Charles I. king of England, quotes the *Pacificque Royal en deuil*, by *Herault*. This author, son to our Desiderius Heraldus, was a minister in Normandy, when he was called to the service of the Walloon-church of London under Cha. I. and he was so zealous a royalist, that he was forced to fly to France, to escape the fury of the commonwealths men. He returned to England after the Restoration, and resumed his ancient employment in the Walloon-church.

Herb church at London: some time after which he obtained a canonry in the cathedral of Canterbury, and enjoyed it till his death.

Herbert.

HERB, in botany; a name by which Linnæus denominates that portion of every vegetable which arises from the root, and is terminated by the fructification. It comprehends, 1. The trunk, stalk, or stem. 2. The leaves. 3. Those minute external parts called by the same author the *fulcra* or supports of plants. 4. The buds, or, as he also terms them, the *winter-quarters* of the future vegetable.

HERB-Christopher. See ACTÆA.

HERB-Robert, (a species of GERANIUM); a plant in great reputation with some farmers on account of its prevailing virtues against staling of blood and the bloody-flux in cattle, in which cases it is said to be the best among a great variety of means commonly used on these occasions.

HERBACEOUS PLANTS, are those which have succulent stems or stalks that lie down to the ground every year. Of herbaceous plants, those are annual which perish stem and root and all every year; biennial, which subsist by the roots two years; perennial which are perpetuated by their roots for a series of years, a new stem being produced every spring.

HERBAGE, in law, signifies the pasture provided by nature for the food of cattle; also the liberty to feed cattle in the forest, or in another person's ground.

HERBAL, signifies a book that treats of the classes, genera, species, and virtues of plants.

HERBAL is sometimes also used for what is more usually called *hortus ficcus*. See HORTUS.

HERBELOT (Bartholomew d'), a French writer, eminent for his oriental learning, was born at Paris in 1625. He travelled several times into Italy, where he obtained the esteem of some of the most learned men of the age. Ferdinand II. grand duke of Tuscany, gave him many marks of his favour: a library being exposed to sale at Florence, the duke desired him to examine the manuscripts in the oriental languages, to select the best of them, and to mark the price; which being done, that generous prince purchased them, and made him a present of them. M. Colbert being at length informed of Herbelot's merit, recalled him to Paris, and obtained a pension for him of 1500 livres: he afterwards became secretary and interpreter of the oriental languages, and royal professor of the Syriac tongue. He died at Paris in 1695. His principal work is intitled *Bibliothèque Orientale*, which he first wrote in Arabic, and afterwards translated into French. It is greatly esteemed. M. Herbelot's modesty was equal to his erudition; and his uncommon abilities were accompanied with the utmost probity, piety, and charity, which he practised thro' the whole course of his life.

HERBERT (Mary), countess of Pembroke, was sister of the famous Sir Philip Sidney, and wife of Henry earl of Pembroke. She was not only a lover of the muses, but a great encourager of polite literature; a character not very common among ladies. Her brother dedicated his incomparable romance *Arcadia* to her, from which circumstance it hath been called *The Countess of Pembroke's Arcadia*. She translated a dramatic piece from the French, intitled *Antonijs*, a tragedy; though it is said she was assisted by her lord's

chaplain, Dr Babington, afterwards bishop of Exeter. She also turned the psalms of David into English metre; but it is doubtful whether these works were ever printed. She died in 1621; and an exalted character of her is to be found in Francis Osborne's memoirs of king James I.

Herbert.

HERBERT (Edward), lord Herbert of Cherbury in Shropshire, an eminent English writer, was born in 1581, and educated at Oxford; after which he travelled, and at his return was made knight of the Bath. James I. sent him ambassador to Louis XIII. in behalf of the Protestants who were besieged in several cities of France; and continued in this station till he was recalled, on account of a dispute between him and the constable de Luines. In 1625 he was advanced to the dignity of a baron in the kingdom of Ireland, by the title of lord Herbert of Castle Island; and in 1631 to that of lord Herbert of Cherbury in Shropshire. After the breaking out of the civil wars, he adhered to the parliament; and in 1644 obtained a pension, on account of his having been plundered by the king's forces. He wrote A History of the Life and Reign of Henry VIII. which was greatly admired; a treatise *De veritate*; and several other works. He died at London in 1648.

"Lord Herbert (says Mr Granger) stands in the first rank of the public ministers, historians, and philosophers of his age. It is hard to say whether his person, his understanding, or his courage, was the most extraordinary; as the fair, the learned, and the brave, held him in equal admiration. But the same man was wise and capricious; redressed wrongs, and quarrelled for punctilios; hated bigotry in religion, and was himself a bigot to philosophy. He exposed himself to such dangers as other men of courage would have carefully declined: and called in question the fundamentals of a religion which none had the hardiness to dispute besides himself."

HERBERT (George), an English poet and divine, was brother to the preceding. He was born in 1593, and educated at Cambridge. In 1619 he was chosen public orator of that university, and afterwards obtained a sinecure from the king. In 1626 he was collated to the prebend of Layton Ecclesia, in the diocese of Lincoln; and in 1630 was inducted into the rectory of Bamerton, near Sarum. The great lord Bacon had such an opinion of his judgment, that he would not suffer his works to be printed before they had passed his examination. He wrote a volume of devout poems, called *The Temple*, and another intitled *The Priest of the Temple*. This pious divine died about the year 1635.

HERBERT (William), earl of Pembroke, was born at Wilton in Wiltshire, 1580; and admitted of New-college in Oxford in 1592, where he continued about two years. In 1601, he succeeded to his father's honours and estate; was made K. G. in 1604; and governor of Portsmouth six years after. In 1626, he was elected chancellor of the university of Oxford; and about the same time made lord steward of the king's household. He died suddenly at his house called *Baynard's castle*, in London, April 10. 1630; according to the calculation of his nativity, says Wood, made several years before by Mr Thomas Allen of Gloucester-hall. Clarendon relates concerning this calculation, that

Herbert
||
Hercula-
neum.

that some considerable persons connected with lord Pembroke being met at Maidenhead, one of them at supper drank a health to the lord steward: upon which another said, that he believed his lordship was at that time very merry; for he had now outlived the day, which it had been prognosticated upon his nativity he would not outlive; but he had outlived it now, for that was his birth-day, which had completed his age to 50 years. The next morning, however, they received the news of his death. Whether the noble historian really believed this and other accounts relating to astrology, apparitions, providential interpositions, &c. which he has inserted in his history, we do not presume to say: he delivers them, however, as if he did not actually disbelieve them. Lord Pembroke was not only a great favourer of learned and ingenious men, but was himself learned, and endued with a considerable share of poetic genius. All that are extant of his productions in this way were published with this title: "Poems written by William Earl of Pembroke, &c. many of which are answered by way of repartee by Sir Benjamin Rudyard, with other Poems written by them occasionally and apart, 1660, 8vo.

HERBERT (Sir Thomas), an eminent gentleman of the Pembroke family, was born at York, where his father was an alderman. William earl of Pembroke sent him to travel at his expence in 1626, and he spent four years in visiting Asia and Africa: his expectations of preferment ending with the death of the earl, he went abroad again, and travelled over several parts of Europe. In 1634, he published, in folio, *A Relation of some Years Travel into Africa and the Great Asia, especially the Territories of the Persian Monarchy, and some parts of the Oriental Indies and Isles adjacent*. On the breaking out of the civil war, he adhered to the parliament; and at Oldenby, on the removal of the king's servants, by desire of the commissioners from the parliament, he and James Harrington were retained as grooms of his bed-chamber, and attended him even to the block. At the restoration he was created a baronet by Charles II. for his faithful services to his father during his two last years. In 1678 he wrote *Threnodia Carolina*, containing an account of the two last years of the life of Charles I. and he assisted Sir William Dugdale in compiling the third volume of his *Monasticon Anglicanum*. He died at York in 1682, leaving several MSS to the public library at Oxford, and others to that of the cathedral at York.

HERBIVOROUS ANIMALS, those which feed only on vegetables.

HERCULANEUM is the name of an ancient city of Campania in Italy, which was destroyed by an eruption of Vesuvius in the first year of the emperor Titus, or the 79th of the Christian era, and lately rendered famous on account of the curious monuments of antiquity discovered in its ruins; an account of which has been published by order of the king of Naples, in a work of six volumes folio.—The epocha of the foundation of Herculaneum is unknown. Dionysius Halicarnassensis conjectures that it may be referred to 60 years before the war of Troy, or about 1342 years before Christ; and therefore that it lasted about 1400 years.

The thickness of the heap of lava and ashes by which the city was overwhelmed, has been much in-

creased by fiery streams vomited since that catastrophe; and now forms a mass 24 feet deep of dark grey stone, which is easily broken to pieces. By its non-adhesion to foreign bodies, marbles and bronzes are preserved in it as in a case made to fit them, and exact moulds of the faces and limbs of statues are frequently found in this substance. The precise situation of this subterraneous city was not known till the year 1713, when it was accidentally discovered by some labourers, who, in digging a well, struck upon a statue on the benches of the theatre. Many others were afterwards dug out and sent to France by the prince of Elbœuf. But little progress was made in the excavations till Charles infant of Spain ascended the Neapolitan throne; by whose unwearied efforts and liberality a very considerable part of Herculaneum has been explored, and such treasures of antiquity drawn out as form the most curious museum in the world. It being too arduous a task to attempt removing the covering, the king contented himself with cutting galleries to the principal buildings, and causing the extent of one or two of them to be cleared. Of these the theatre is the most considerable. On a ballustrade which divided the orchestra from the stage was found a row of statues; and, on each side of the pulpitum, the equestrian figure of a person of the Nonia family. They are now placed under porticos of the palace; and from the great rarity of equestrian statues in marble would be very valuable objects, were their workmanship even less excellent than it is: one of them in particular is a very fine piece of sculpture. Since the king of Spain left Naples, the digging has been continued, but with less spirit and expenditure: indeed the collection of curiosities brought out of Herculaneum and Pompeii is already so considerable, that a relaxation of zeal and activity becomes excusable. They are now arranged in a wing of the palace; and consist not only of statues, busts, altars, inscriptions, and other ornamental appendages of opulence and luxury; but also comprehend an entire assortment of the domestic, musical, and surgical instruments used by the ancients; tripods of elegant form and exquisite execution, lamps in endless variety, vases and basons of noble dimensions, chandeliers of the most beautiful shapes, pateras and other appurtenances of sacrifice, looking-glasses of polished metal, coloured glass so hard, clear, and well stained, as to appear emeralds, sapphires, and other precious stones; a kitchen completely fitted up with copper-pans lined with silver, kettles, cisterns for heating water, and every utensil necessary for culinary purposes; specimens of various sorts of combustibles, retaining their form though burnt to a cinder; corn, bread, fish, oil, wine, and flour: a lady's toilet, fully furnished with combs, thimbles, rings, paint, earrings, &c. Among the statues, which are numerous, connoisseurs allow the greatest share of merit to a Mercury and a sleeping faun: the busts fill several rooms; but very few of the originals whom they were meant to imitate are known. The floors are paved with ancient Mosaic. Few rare medals have been found in these ruins; the most curious is a gold medallion of Augustus struck in Sicily in the 15th year of his reign. The fresco paintings, which, for the sake of preservation, have been torn off the walls and framed and glazed, are to be seen in another part of the palace.

Hercula-
neum.

"The

Hercula-
neum.
Hercules.

"The elegance of the attitudes, and the infinite variety of the subjects (Mr Swinburne observes), stamp them as performances worthy of the attention of artists and antiquarians; but no pictures yet found are masterly enough to prove that the Greeks carried the art of painting to as great a height of perfection as they did that of statuary. Yet can we suppose those authors incapable of appreciating the merits of an Apelles or a Zeuxis, who with so much critical discernment have pointed out the beauties of the works of a Phidias or a Praxiteles, beauties that we have still an opportunity of contemplating? would they have bestowed equal praises upon both kinds of performances if either of them had been much inferior to the other? I think it is not probable; and we must presume, that the capital productions of the ancient painters, being of more perishable materials than busts and statues, have been destroyed in the fatal disasters that have so often afflicted both Greece and Italy. Herculaneum and Pompeii were but towns of the second order, and not likely to possess the masterpieces of the great artists, which were usually destined to adorn the more celebrated temples, or the palaces of kings and emperors." A more valuable acquisition than bronzes and pictures was thought to be made, when a large parcel of manuscripts was found among the ruins. Hopes were entertained that many works of the classics, which time has deprived us of, were now going to be restored to light, and that a new mine of science was on the point of being opened. But the difficulty of unrolling the burnt parchment, of pasting the fragments on a flat surface, and of decyphering the obscure letters, have proved such obstacles, that very little progress has been made in the work. A priest invented the method of proceeding; but it would require the joint labours of many learned men to carry on so nice and tedious an operation with any success. The plan is dropped; and the manuscripts now lie in dusty heaps, as useless to the learned world as they had been for the preceding seventeen centuries.

HERCULES, in fabulous history, a most renowned Grecian hero, who after death was ranked among the gods, and received divine honours. According to the ancients, there were many persons of the same name. Diodorus mentions three, Cicero six, and some authors extend the number to no less than forty-three. Of all these, one generally called the *Theban Hercules*, is the most celebrated; and to him, as may easily be imagined, the actions of the others have been attributed. He is reported to have been the son of Jupiter by Alcmena (wife to Amphitryon king of Argos), whom Jupiter enjoyed in the shape of her husband while he was absent; and in order to add the greater strength to the child, made that amorous night as long as three. Amphitryon having soon after accidentally killed his uncle and father-in-law Electryon, was obliged to fly to Thebes, where Hercules was born. The jealousy of Juno, on account of her husband's amour with Alcmena, prompted her to destroy the infant. For this purpose she sent two serpents to kill him in the cradle, but young Hercules strangled them both. He was early instructed in the liberal arts, and Castor the son of Tyndarus taught him how to fight, Eurytus how to shoot with a bow and arrows, Autolicus to drive a chariot, Linus to play on the lyre, and Eumolpus to

sing. He, like the rest of his illustrious contemporaries, soon after became the pupil of the centaur Chiron, and under him he perfected and rendered himself the most valiant and accomplished of the age. In the 18th year of his age he resolved to deliver the neighbourhood of mount Cithæron from a huge lion which preyed on the flocks of Amphitryon his supposed father, and which laid waste the adjacent country. He went to the court of Thespius king of Thespiis, who shared in the general calamity; and he received here a tender treatment, and was entertained during 50 days. The 50 daughters of the king became mothers by Hercules during his stay at Thespiis, and some say that it was effected in one night. After he had destroyed the lion of mount Cithæron, he delivered his country from the annual tribute of 100 oxen which it paid to Erginus. Such public services became universally known; and Creon, who then sat on the throne of Thebes, rewarded the patriotic deeds of Hercules by giving him his daughter in marriage, and entrusting him with the government of his kingdom.

Eurystheus, the son of Amphitryon, having succeeded his father, soon became jealous of Hercules; and fearing lest he might by him be deprived of his crown, left no means untried to get rid of him. Of this Hercules was not insensible, because he was perpetually engaging him on some desperate expedition; and therefore went to consult the oracle. But being answered that it was the pleasure of the gods that he should serve Euristheus 12 years, he fell into a deep melancholy, which at last ended in a furious madness; during which, among other desperate actions, he put away his wife Megara, and murdered all the children he had by her. As an expiation of this crime, the king imposed upon him twelve labours surpassing the power of all other mortals to accomplish, which nevertheless our hero performed with great ease. The favours of the gods had indeed completely armed him when he undertook his labours. He had received a coat of armour and helmet from Minerva, a sword from Mercury, a horse from Neptune, a shield from Jupiter, a bow and arrows from Apollo, and from Vulcan a golden cuirass and brazen buskin, with a celebrated club of brass according to the opinion of some writers.

The first labour imposed upon him was the killing of a lion in Nemea, a wood of Achaia; whose hide was proof against any weapon, so that he was forced to seize him by the throat and strangle him. He carried the dead beast on his shoulders to Mycenæ, and ever after clothed himself with the skin. Eurystheus was so astonished at the sight of the beast, and at the courage of Hercules, that he ordered him never to enter the gates of the city when he returned from his expeditions, but to wait for his orders without the walls. He even made himself a brazen vessel into which he retired whenever Hercules returned.—The second labour was to destroy the Lernaean hydra, which had seven heads according to Apollodorus, 50 according to Simonides, and 100 according to Diodorus. This celebrated monster he first attacked with his arrows; but soon after he came to a close engagement, and by means of his heavy club he destroyed the heads of his enemy. This, however, was productive of no advantage; for as soon as one head was beaten to pieces by the club, immediately two sprang up; and the labour

off

Hercules. of Hercules would have remained unfinished, had not he commanded his friend Iolas to burn with a hot iron the root of the head which he had crushed to pieces. This succeeded; and Hercules became victorious, opened the belly of the monster, and dipped his arrows in the gall to render the wounds which he gave fatal and incurable.—He was ordered in his third labour to bring alive and unhurt into the presence of Eurystheus a stag, famous for its incredible swiftness, its golden horns, and brazen feet. This celebrated animal frequented the neighbourhood of Cænoë; and Hercules was employed for a whole year in continually pursuing it: at last he caught it in a trap, or when tired, or, according to others, by slightly wounding it and lessening its swiftness.—The fourth labour was to bring alive to Eurystheus a wild boar which ravaged the neighbourhood of Erymanthus. In this expedition he destroyed the centaurs, and caught the boar by closely pursuing him through the deep snow. Eurystheus was so frightened at the sight of the boar, that, according to Diodorus, he hid himself in his brazen vessel for some days.—In his fifth labour Hercules was ordered to clean the stables of Augeas, where 3000 oxen had been confined for many years.—For his sixth labour he was ordered to kill the carnivorous birds which ravaged the country near the lake Stymphalis in Arcadia.—In his seventh labour he brought alive into Peloponnesus a prodigious wild bull which laid waste the island of Crete.—In his eighth labour he was employed in obtaining the mares of Diomedes, which fed upon human flesh. He killed Diomedes, and gave him to be eat by his mares, which he brought to Eurystheus. They were sent to mount Olympus by the king of Mycenæ, where they were devoured by the wild beasts; or, according to others, they were consecrated to Jupiter, and their breed still existed in the age of Alexander the Great.—For his ninth labour, he was commanded to obtain the girdle of the queen of the Amazons.—In his tenth labour he killed the monster Geryon king of Gades, and brought to Argos his numerous flocks which fed upon human flesh. This was in Iberia or Spain; in the furthest parts of which he erected his two pillars, as the utmost limits of the then known world. These ten labours he atchieved, as the fable says, in about eight years. In this last expedition he is likewise affirmed to have killed Antæus, a famous giant of a monstrous size, who, when weary with wrestling or labour, was immediately refreshed by touching the earth. Hercules overcame him in wrestling, and slew him; and after him the tyrant Busiris, in his way through Egypt. This bloody man used to sacrifice all his guests and strangers upon his altars; and designing to have done the same by Hercules, was slain by him, together with all his attendants.—His eleventh labour was the carrying away the Hesperian golden apples kept by a dragon: (See HESPERIDES).—The twelfth and last, and most dangerous of his labours, was to bring upon earth the three-headed dog Cerberus. Descending into hell by a cave on mount Tænarus, he was permitted by Pluto to carry away his friends Theseus and Pirithous, who were condemned to punishment in hell, and Cerberus also was granted to his prayers, provided he made use of no arms but only force to drag him away. Hercules, as

some report, carried him back to hell after he had brought him before Eurystheus. **Hercules.**

Many other exploits are said to have been performed by Hercules; in particular, he accompanied the Argonauts to Colchis before he delivered himself up to the king of Mycenæ. He assisted the gods in their wars against the giants, and it was through him alone that Jupiter obtained a victory. He conquered Laomedon, and pillaged Troy. When Iole, the daughter of Eurytus king of Cæchalia, of whom he was deeply enamoured, was refused to his entreaties, he became the prey of a second fit of insanity, and he murdered Iphitus, the only one of the sons of Eurytus who favoured his addresses to Iole. He was some time after purified of the murder, and his insanity ceased; but the gods persecuted him, and he was visited by a disorder which obliged him to apply to the oracle of Delphi for relief. The coldness with which the Pythia received him irritated him, and he resolved to plunder Apollo's temple and carry away the sacred tripod. Apollo opposed him, and a severe conflict was begun, which nothing but the interference of Jupiter with his thunderbolts could have prevented. He was upon this told by the oracle that he must be sold as a slave, and remain three years in the most abject servitude to recover from his disorder. He complied; and Mercury, by order of Jupiter, conducted him to Omphale, queen of Lydia, to whom he was sold as a slave. Here he cleared all the country from robbers; and Omphale, who was astonished at the greatness of his exploits, married him. Hercules had Agelaus and Lamon by Omphale, from whom Cræsus king of Lydia was descended. He became also enamoured of one of Omphale's female servants, by whom he had Alceus. After he had completed the years of his slavery, he returned to Peloponnesus, where he re-established on the throne of Sparta Tyndarus, who had been expelled by Hippocoon. He became one of Dejanira's suitors, and married her after he had overcome all his rivals. He was obliged to leave Calydon his father-in-law's kingdom, because he had inadvertently killed a man with a blow of his fist; and it was on account of this expulsion that he was not present at the hunting of the Calydonian boar. From Calydon he retired to the court of Ceyx king of Trachinia. The king received him and his wife with great marks of friendship, and purified him of the murder which he had committed at Calydon. Hercules was still mindful that he had once been refused the hand of Iole; he therefore made war against her father Eurytus, and killed him with three of his sons. Iole fell into the hands of her father's murderer, and found that she was loved by Hercules as much as before. She accompanied him on mount Cæta, where he was going to raise an altar and offer a solemn sacrifice to Jupiter. As he had not then the shirt and tunic in which he arrayed himself to offer a sacrifice, he sent Lichas to Trachin to his wife Dejanira, in order to provide himself a proper dress. Dejanira had some time before been attempted by the Centaur Nessus, as he was ferrying her over the river Euenus; and Hercules beholding it from the shore, had given him a mortal wound with an arrow. The monster finding himself dying, advised her to mix some oil with the blood which flowed from his wound, and

Hercules. and to anoint her husband's shirt with it, pretending that it would infallibly secure him from loving any other woman; and she, too well apprised of his inconstancy, had actually prepared the poisoned ointment accordingly.—Lychas coming to her for the garments, unfortunately acquainted her with his having brought away Iole; upon which she, in a fit of jealousy, anointed his shirt with the fatal mixture. This had no sooner touched his body, than he felt the poison diffuse itself through all his veins; the violent pain of which caused him to disband his army, and to return to Trachin. His torment still increasing, he sent to consult the oracle for a cure; and was answered, that he should cause himself to be conveyed to mount Ceta, and there rear up a great pile of wood, and leave the rest to Jupiter. By the time he had obeyed the oracle, his pains being become intolerable, he dressed himself in his martial habit, flung himself upon the pile, and desired the bystanders to set fire to it. Others say that he left the charge of it to his son Philoctetes; who having performed his father's command, had his bow and arrows given him as a reward for his obedience. At the same time Jupiter, to be as good as his word, sent a flash of lightning, which consumed both the pile and the hero; insomuch that Iolæus, coming to take up his bones, found nothing but ashes: from which they concluded, that he was passed from earth to heaven, and joined to the gods. His friends showed their gratitude to his memory by raising an altar where the burning pile had stood. Menœtius the son of Actor offered him a sacrifice of a bull, a wild boar, and a goat, and enjoined the people of Opus yearly to observe the same religious ceremonies. His worship soon became as universal as his fame; and Juno, who had once persecuted him with such fury, forgot her resentment, and gave him her daughter Hebe in marriage. Hercules has received many surnames and epithets, either from the place where his worship was established, or from the labours which he achieved. His temples were numerous and magnificent, and his divinity revered. No dogs or flies ever entered his temple at Rome; and that of Gades, according to Strabo, was always forbidden to women and pigs. The Phœnicians offered quails on his altars; and as it was supposed that he presided over dreams, the sick and infirm were sent to sleep in his temples, that they might receive in their dreams the agreeable presages of their approaching recovery. The white poplar was particularly dedicated to his service.

It is observed, that there are none even of the twelve great gods of antiquity that have so many ancient monuments relating to them as Hercules. The famous statue of Hercules, in the Farnese palace at Rome, is well known to the connoisseurs: this represents him resting after the last of his twelve labours above recited, leaning on his club, and holding the apples of the Hesperides in his hand. In this statue, as in all the other figures of him, he is formed, by the breadth of his shoulders, the spaciousness of his chest, the largeness of his size, and the firmness of his muscles, to express strength and a capacity of enduring great fatigue, which constituted the chief idea of virtue among the ancient heathens. His other attributes are his lion's skin, his club, and his bow.—Hercules is represented by the ancients as an exemplar of virtue;

VOL. VIII. Part II.

however, the *Hercules bibax*, or drunken Hercules, is no uncommon figure; and his amours are described both by the poets and artists. Thus, the Cupids are made to take away his club, and he is exhibited in the posture of bending under a little boy; by which actions we perceive, that he who conquered all difficulties was a slave to love. His children are as numerous as the labours and difficulties which he underwent; and indeed they became so powerful soon after his death, that they alone had the courage to invade all Peloponnesus. See HERACLIDÆ.

The apotheosis of Hercules, or the establishment of his altars in the principal cities of Greece, is fixed by Trasybulus 29 years before the taking of Troy.

Hercules has been particularly honoured by the Greeks under the name of *Musagetes*, "the conductor of the Muses;" and at Rome under that of *Hercules Musarum*. He is represented on medals with a lyre in his hand; and the reverse is marked with the figure of the nine Muses, with their proper symbols.

HERCULES, in astronomy, one of the constellations of the northern hemisphere.—The stars in the constellation Hercules in Ptolemy's catalogue are 29; in Tycho's, 28; in the Britannic catalogue, 113.

HERCULES'S Pillars, in antiquity, a name given to two lofty mountains, situated one on the most southern extremity of Spain, and the other on the opposite part of Africa. They were called by the ancients *Abyla* and *Calpe*. They are reckoned the boundaries of the labours of Hercules; and according to ancient tradition, they were joined together till they were severed by the arm of the hero, and a communication opened between the Mediterranean and Atlantic seas.

HERCYNIA SILVA (anc. geog.), the largest of forests. Its breadth was a journey of nine days to the best traveller. Taking its rise at the limits of the Helvetii, Nemetes, and Rauraci, it run along the Danube to the borders of the Daci and Anartes, a length of 60 days journey, according to Cæsar, who appears to have been well acquainted with its true breadth, seeing it occupied all Lower Germany. It may therefore be considered as covering the whole of Germany; and most of the other forests may be considered as parts of it, though distinguished by particular names: consequently the Hartz, in the duchy of Brunswic, which gave name to the whole, may be considered as one of its parts. The name *Hartz* denotes "resinous," or "pine-trees." By the Greeks it is called *Orcynius*, as a name common to all the forests in Germany; in the same manner as *Hercynius* was the name given by the Romans; and both from the German *Hartz*.

HERD, among hunters, an assemblage of black or fallow beasts in contradistinction to *flock*. See FLOCK.—In the hunting language there are various terms used for companies of the divers kinds of game. We say a *herd* of harts or bucks, a *bevy* of roes, a *route* of wolves, a *riches* of martens, &c.

HEREDITAMENTS, whatever moveable things a person may have to himself and his heirs by way of inheritance; and which, if not otherwise bequeathed, descend to him who is next heir, and not to the executor as chattels do.

HEREDITARY, an appellation given to whatever belongs to a family by right of succession from heir to heir.

Hereditary. HEREDITARY is also figuratively applied to good or ill qualities supposed to be transmitted from father to son: thus we say virtue and piety are hereditary qualities in such a family; and that in Italy the hatred of families is hereditary. And indeed the gout, king's evil, madness, &c. may really be hereditary diseases.

HEREDITARY Right, in the British constitution. The grand fundamental maxim upon which the *jus coronæ*, or right of succession to the throne of Britain depends, Sir William Blackstone takes to be this: That the crown is, by common law and constitutional custom, hereditary; and this in a manner peculiar to itself: but that the right of inheritance may from time to time be changed or limited by act of parliament; under which limitations the crown still continues hereditary.

1. The crown is in general hereditary, or descendible to the next heir, on the death or demise of the last proprietor. All regal governments must be either hereditary or elective: and as there is no instance wherein the crown of England has ever been asserted to be elective, except by the regicides at the infamous and unparalleled trial of king Charles I. it must of consequence be hereditary. Yet in thus asserting an hereditary right, a *jure divino* title to the throne is by no means intended. Such a title may be allowed to have subsisted under the theocratic establishments of the children of Israel in Palestine: but it never yet subsisted in any other country; save only so far as kingdoms, like other human fabrics, are subject to the general and ordinary dispensations of Providence. Nor indeed have a *jure divino* and an hereditary right any necessary connection with each other; as some have very weakly imagined. The titles of David and Jehu were equally *jure divino* as those of either Solomon or Ahab; and yet David slew the sons of his predecessor, and Jehu his predecessor himself. And when our kings have the same warrant as they had, whether it be to sit upon the throne of their fathers, or to destroy the house of the preceding sovereign, they will then, and not before, possess the crown of England by a right like theirs, immediately derived from heaven. The hereditary right, which the laws of England acknowledge, owes its origin to the founders of our constitution, and to them only. It has no relation to, nor depends upon, the civil laws of the Jews, the Greeks, the Romans, or any other nation upon earth; the municipal laws of one society having no connection with, or influence upon, the fundamental polity of another. The founders of our English monarchy might perhaps, if they had thought proper, have made it an elective monarchy; but they rather chose, and upon good reason, to establish originally a succession by inheritance. This has been acquiesced in by general consent, and ripened by degrees into common law: the very same title that every private man has to his own estate. Lands are not naturally descendible, any more than thrones: but the law has thought proper, for the benefit and peace of the public, to establish hereditary succession in the one as well as the other.

It must be owned, an elective monarchy seems to be the most obvious, and best suited of any to the rational principles of government, and the freedom of human nature: and accordingly we find from history, that, in the infancy and first rudiments of almost every state,

the leader, chief magistrate, or prince, hath usually been elective. And, if the individuals who compose that state could always continue true to first principles, uninfluenced by passion or prejudice, unassailed by corruption, and unawed by violence, elective succession were as much to be desired in a kingdom as in other inferior communities. The best, the wisest, and the bravest man, would then be sure of receiving that crown which his endowments have merited; and the sense of an unbiassed majority would be dutifully acquiesced in by the few who were of different opinions. But history and observation will inform us, that elections of every kind (in the present state of human nature) are too frequently brought about by influence, partiality, and artifice: and, even where the case is otherwise, these practices will be often suspected, and as constantly charged upon the successful, by a sullen and disappointed minority. This is an evil to which all societies are liable; as well those of a private and domestic kind, as the great community of the public, which regulates and includes the rest. But in the former there is this advantage, That such suspicions, if false, proceed no farther than jealousies and murmurs, which time will effectually suppress; and, if true, the injustice may be remedied by legal means, by an appeal to those tribunals to which every member of society has (by becoming such) virtually engaged to submit. Whereas, in the great and independent society, which every nation composes, there is no superior to resort to but the law of nature; no method to redress the infringements of that law, but the actual exertion of private force. As therefore between two nations, complaining of mutual injuries, the quarrel can only be decided by the law of arms; so in one and the same nation, when the fundamental principles of their common union are supposed to be invaded, and more especially when the appointment of their chief magistrate is alleged to be unduly made, the only tribunal to which the complainants can appeal is that of the God of battles, the only process by which the appeal can be carried on is that of a civil and intestine war. An hereditary succession to the crown is therefore now established, in this and most other countries, in order to prevent that periodical bloodshed and misery, which the history of ancient imperial Rome, and the more modern experience of Poland and Germany, may show us are the consequences of elective kingdoms.

2. But, secondly, as to the particular mode of inheritance, It in general corresponds with the feudal path of descents, chalked out by the common law in the succession to landed estates; yet with one or two material exceptions. Like them, the crown will descend lineally to the issue of the reigning monarch; as it did from king John to Richard II. through a regular pedigree of six lineal generations: As in them the preference of males to females, and the right of primogeniture among the males, are strictly adhered to. Thus Edward V. succeeded to the crown, in preference to Richard his younger brother, and Elizabeth his elder sister. Like them, on failure of the male line, it descends to the issue female; according to the ancient British custom remarked by Tacitus, *Solent faminarum ductu bellare, et sexum in imperiis non discernere*. Thus Mary I. succeeded to Edward VI.; and the line of Margaret queen of Scots, the daughter of Henry VII.

Hereditary. succeeded, on failure of the line of Henry VIII. his son. But among the females, the crown descends by right of primogeniture to the eldest daughter only and her issue; and not, as in common inheritances, to all the daughters at once; the evident necessity of a sole succession to the throne having occasioned the royal law of descents to depart from the common law in this respect: and therefore queen Mary, on the death of her brother, succeeded to the crown alone, and not in partnership with her sister Elizabeth. Again, the doctrine of representation prevails in the descent of the crown, as it does in other inheritances; whereby the lineal descendants of any person deceased stand in the same place as their ancestor, if living, would have done. Thus Richard II. succeeded his grandfather Edward III. in right of his father the black prince; to the exclusion of all his uncles, his grandfather's younger children. Lastly, on failure of lineal descendants, the crown goes to the next collateral relations of the late king; provided they are lineally descended from the blood-royal, that is, from that royal stock which originally acquired the crown. Thus Henry I. succeeded to William II. John to Richard I. and James I. to Elizabeth; being all derived from the Conqueror, who was then the only regal stock. But herein there is no objection (as in the case of common descents) to the succession of a brother, an uncle, or other collateral relation, of the half-blood; that is, where the relationship proceeds not from the same couple of ancestors (which constitutes a kinsman of the whole blood), but from a single ancestor only; as when two persons are derived from the same father, and not from the same mother, or *vice versa*: provided only, that the one ancestor, from whom both are descended, be that from whose veins the blood-royal is communicated to each. Thus Mary I. inherited to Edward VI. and Elizabeth inherited to Mary; all born of the same father, king Henry VIII. but all by different mothers. See the articles CONSANGUINITY, DESCENT, and SUCCESSION.

3. The doctrine of hereditary right does by no means imply an indefeasible right to the throne. No man will assert this, who has considered our laws, constitution, and history, without prejudice, and with any degree of attention. It is unquestionably in the breast of the supreme legislative authority of this kingdom, the king and both houses of parliament, to defeat this hereditary right; and, by particular entails, limitations, and provisions, to exclude the immediate heir, and vest the inheritance in any one else. This is strictly consonant to our laws and constitution; as may be gathered from the expression so frequently used in our statute-book, of "the king's majesty, his heirs, and successors." In which we may observe, that as the word heirs necessarily implies an inheritance or hereditary right generally subsisting in the royal person; so the word *successors*, distinctly taken, must imply that this inheritance may sometimes be broken through; or, that there may be a successor, without being the heir of the king. And this is so extremely reasonable, that without such a power, lodged somewhere, our polity would be very defective. For, let us barely suppose so melancholy a case, as that the heir-apparent should be a lunatic, an idiot, or otherwise incapable of reigning; how miserable would the condition of the

nation be, if he were also incapable of being set aside! **Hereditary** —It is therefore necessary that this power should be lodged somewhere; and yet the inheritance and regal dignity would be very precarious indeed, if this power were expressly and avowedly lodged in the hands of the subject only, to be exerted whenever prejudice, caprice, or discontent, should happen to take the lead. Consequently it can nowhere be so properly lodged as in the two houses of parliament, by and with the consent of the reigning king; who, it is not to be supposed, will agree to any thing improperly prejudicial to the rights of his own descendants. And therefore in the king, lords, and commons, in parliament assembled, our laws have expressly lodged it.

4. But, fourthly, However the crown may be limited or transferred, it still retains its descendible quality, and becomes hereditary in the wearer of it. And hence in our law the king is said never to die in his political capacity; though, in common with other men, he is subject to mortality in his natural: because immediately upon the natural death of Henry, William, or Edward, the king survives in his successor. For the right of the crown vests, *eo instanti*, upon his heir; either the *heres natus*, if the course of descent remains unimpeached, or the *heres factus*, if the inheritance be under any particular settlement. So that there can be no interregnum; but, as Sir Matthew Hale observes, the right of sovereignty is fully invested in the successor by the very descent of the crown. And therefore, however acquired, it becomes in him absolutely hereditary, unless by the rules of the limitation it is otherwise ordered and determined: In the same manner as landed estates, to continue our former comparison, are by the law hereditary, or descendible to the heirs of the owner; but still there exists a power, by which the property of those lands may be transferred to another person. If this transfer be made simply and absolutely, the lands will be hereditary in the new owner, and descend to his heir at law: but if the transfer be clogged with any limitations, conditions, or entails, the lands must descend in that channel, so limited and prescribed, and no other. See SUCCESSION.

HEREDITAS JACENS, in Scots law. An estate is said to be *in hereditate jacente*, after the proprietor's death till the heir's entry.

HEREFORD, which in Saxon signifies *the ford of the army*, the capital of Herefordshire in England, situated in W. Long. 2. 35. N. Lat. 52. 6. It is supposed to have risen out of the ruins of Kenchester, in its neighbourhood, which Camden believes to have been the *Ariconium* of Antoninus. It is very pleasantly situated among meadows and corn-fields, and is almost encompassed with rivers. It seems to have owed its rise, or at least its increase, to the building and dedicating a church there to Ethelbert king of the East-Angles, who was murdered in the neighbourhood, and afterwards taken into the catalogue of martyrs; soon after it became a bishop's see, and in consequence of that a considerable place. In 1055 it was sacked, the cathedral destroyed, and its bishop Leofgar carried away captive by Gryffin prince of South Wales, and Algar, an Englishman, who had rebelled against Edward the Confessor. Harold fortified it with a broad and high rampart; and it appears

Hereford,
Hereford-
shire.

by Doomsday-book, that there were no more than 300 men within and without the wall. A very large and strong castle was built by the Normans along the Wye, and the city walled round. The present stately cathedral was founded in the reign of Henry I. by bishop Reinelm, but enlarged and beautified by his successors. It suffered much in the barons wars; and was often taken and retaken in the war between king Charles I. and the parliament. This city is pretty large, and had once six churches; but two were destroyed in the civil wars. It is not very populous nor well built, many of the houses being old. Its manufactures are gloves and other leathern goods; and its corporation consists of a mayor, six aldermen, a high-steward, deputy-steward, and town-clerk, who have a sword-bearer, and four serjeants at mace. Each of the companies enjoys distinct laws and privileges by their charter, and each has its hall. The cathedral, which was built in 1050, and destroyed by the Welsh in 1060, but rebuilt in the reign of the Conqueror, or, as some say, in that of Henry I. is a beautiful and magnificent structure, but being greatly decayed, part of it was destroyed by the fall of the tower in September 1786, and the spire on another tower was taken down to be rebuilt at the same time. Here is an hospital well endowed for 16 poor people; and two charity-schools, one for 60 boys, the other for 40 girls. The chapter-house, which was once a very elegant building, built about the year 1079, is now in ruins. Here were formerly two or three priories. Almost the only drink here is cyder, which is both cheap and good, the very hedges in the country being planted with apple-trees. The city gave long the title of *earl* to the noble family of the Bohuns; then of *duke* to Henry of Lancaster, afterwards Henry IV. king of England; after him, of *earl* to Stafford earl of Buckingham; then of *viscount* to D'Evereux earl of Essex, which a collateral branch of this family still enjoys, and is thereby the premier viscount of England.

HEREFORDSHIRE, a county of England, nearly of a circular form, bounded on the east by Worcester and Gloucester, on the south by Monmouthshire, on the west by Radnorshire and Brecknockshire, and on the north by Shropshire. Its length from north to south is 46 miles, its breadth from east to west 40, and its circumference 220. It contains 8 market towns, 87 vicarages, 176 parishes, and 391 villages, 15,000 houses, and 97,600 inhabitants. It is divided into 11 hundreds, and sends eight members to parliament, namely, two knights for the shire, and two for each of the following towns, Hereford, Lempster or Leominster, and Weobly.

The air of this county is allowed to be as pleasant, sweet, and wholesome, as that of any other in England, there being nothing either in the soil or situation to render it otherwise. The soil throughout is excellent, and inferior to none, either for grain, fruit, or pasture, supplying the inhabitants plentifully with all the necessaries of life: but that by which it is distinguished from most others, is its fruit, especially apples, of which it produces such quantities, that the cyder made of them is not only sufficient for their own consumption, though it is their ordinary drink, but also in a great measure for that of London and other parts. That in particular which is made from the apple called

redstreak, is much admired, and has a body almost equal to that of white-wine. The county is well supplied with wood and water; for, besides lesser streams, there are the rivers Frome, Loden, Lug, Wye, Wadel, Arrow, Dare, and Monow; the last of which is large, and all of them are well stored with fish, particularly the Wye, which breeds salmon. It lies in the diocese of Hereford, and Oxford circuit.

HERENHAUSEN, a palace of Germany near Hanover, belonging to the king of Great Britain. Here are lodgings for all the court; and a garden of vast extent, in which are fine waterworks, a labyrinth, and many other curiosities worthy the observation of a traveller.

HERENTHALS, a town of Brabant in the Austrian Netherlands, in the quarter of Antwerp; seated on the river Nethe, in E. Long. 4. 51. N. Lat. 51. 9.

HERESY, in law, an offence against Christianity, consisting in a denial of some of its essential doctrines, publicly and obstinately avowed; being defined, "*sententia rerum divinarum humano sensu excogitata, palam docta et pertinaciter defensa.*" And here it must be acknowledged that particular modes of belief or unbelief, not tending to overturn Christianity itself, or to sap the foundations of morality, are by no means the object of coercion by the civil magistrate. What doctrines shall therefore be adjudged heresy, was left by our old constitution to the determination of the ecclesiastical judge; who had herein a most arbitrary latitude allowed him. For the general definition of an heretic given by Lyndewode, extends to the smallest deviations from the doctrines of the holy church: "*hereticus est qui dubitat de fide catholica, et qui negligit servare ea, quæ Romana ecclesia statuit, seu servare decreverat.*" Or, as the statute 2 Hen. IV. c. 15. expresses it in English, "teachers of erroneous opinions, contrary to the faith and blessed determinations of the holy church." Very contrary this to the usage of the first general councils, which defined all heretical doctrines with the utmost precision and exactness. And what ought to have alleviated the punishment, the uncertainty of the crime, seems to have enhanced it in those days of blind zeal and pious cruelty. It is true, that the sanctimonious hypocrisy of the canonists went at first no farther than enjoining penance, excommunication, and ecclesiastical deprivation, for heresy; tho' afterwards they proceeded boldly to imprisonment by the ordinary, and confiscation of goods *in pios usus*. But in the mean time they had prevailed upon the weakness of bigotted princes to make the civil power subservient to their purposes, by making heresy not only a temporal, but even a capital, offence: the Romish ecclesiastics determining, without appeal, whatever they pleased to be heresy, and shifting off to the secular arm the odium and drudgery of executions; with which they themselves were too tender and delicate to intermeddle. Nay, they pretended to intercede and pray, on behalf of the convicted heretic, *ut citra mortis periculum sententia circa eum moderetur*: well knowing that at the same time they were delivering the unhappy victim to certain death. Hence the capital punishments inflicted on the ancient Donatists and Manichæans by the emperors Theodosius and Justinian: hence also the constitution of the emperor Frederic mentioned by Lyndewode, adjudging all persons with-

out:

Heresy.

out distinction to be burnt with fire who were convicted of heresy by the ecclesiastical judge. The same emperor, in another constitution, ordained, that if any temporal lord, when admonished by the church, should neglect to clear his territories of heretics within a year, it should be lawful for good catholics to seize and occupy the lands, and utterly to exterminate the heretical possessors. And upon this foundation was built that arbitrary power, so long claimed and so fatally exerted by the Pope, of disposing even of the kingdoms of refractory princes to more dutiful sons of the church. The immediate event of this constitution was something singular, and may serve to illustrate at once the gratitude of the holy see, and the just punishment of the royal bigot; for, upon the authority of this very constitution, the pope afterwards expelled this very emperor Frederic from his kingdom of Sicily, and gave it to Charles of Anjou.

Christianity being thus deformed by the daemon of persecution upon the continent, we cannot expect that our own island should be entirely free from the same scourge. And therefore we find among our ancient precedents a writ *de heretico comburendo*, which is thought by some to be as ancient as the common law itself. However, it appears from thence, that the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop himself in a provincial synod; and that the delinquent was delivered over to the king to do as he should please with him: so that the crown had a controul over the spiritual power, and might pardon the convict by issuing no process against him; the writ *de heretico comburendo* being not a writ of course, but issuing only by the special direction of the king in council.

But in the reign of Henry IV. when the eyes of the Christian world began to open, and the seeds of the Protestant religion (though under the opprobrious name of *lollardy*) took root in this kingdom; the clergy, taking advantage from the king's dubious title to demand an increase of their own power, obtained an act of parliament, which sharpened the edge of persecution to its utmost keenness. For, by that statute, the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. By the statute 2 Hen. V. c. 7. *lollardy* was also made a temporal offence, and indictable in the king's courts; which did not thereby gain an exclusive, but only a concurrent, jurisdiction with the bishop's consistory.

Afterwards, when the final reformation of religion began to advance, the power of the ecclesiastics was somewhat moderated; for though what heresy is, was not then precisely defined, yet we are told in some points what it is not: the statute 25 Hen. VIII. c. 14. declaring, that offences against the see of Rome are not heresy; and the ordinary being thereby restrained from proceeding in any case upon mere suspicion; that is, unless the party be accused by two credible witnesses, or an indictment of heresy be first previously found in the king's courts of common law. And yet the spirit of persecution was not yet abated, but only diverted into a lay channel. For in six years afterwards, by

statute 31 Hen. VIII. c. 14. the bloody law of the six articles was made, which established the six most contested points of popery, transubstantiation, communion in one kind, the celibacy of the clergy, monastic vows, the sacrifice of the mass, and auricular confession; which points were "determined and resolved by the most godly study, pain, and travail of his majesty: for which his most humble and obedient subjects, the lords spiritual and temporal and the commons, in parliament assembled, did not only render and give unto his highness their most high and hearty thanks;" but did also enact and declare all opposers of the first to be heretics, and to be burnt with fire; and of the five last to be felons, and to suffer death. The same statute established a new and mixed jurisdiction of clergy and laity for the trial and conviction of heretics; the reigning prince being then equally intent on destroying the supremacy of the bishops of Rome, and establishing all other their corruptions of the Christian religion.

Without perplexing this detail with the various repeals and revivals of these sanguinary laws in the two succeeding reigns, let us proceed to the reign of queen Elizabeth; when the reformation was finally established with temper and decency, unswayed with party-rancour, or personal caprice and resentment. By statute 1 Eliz. c. 1. all former statutes relating to heresy are repealed, which leaves the jurisdiction of heresy as it stood at common law; viz. as to the infliction of common censures, in the ecclesiastical courts; and in case of burning the heretic, in the provincial synod only. Sir Matthew Hale is indeed of a different opinion, and holds that such power resided in the diocesan also; though he agrees, that in either case the writ *de heretico comburendo* was not demandable of common right, but grantable or otherwise merely at the king's discretion. But the principal point now gained was, that by this statute a boundary is for the first time set to what shall be accounted heresy; nothing for the future being to be so determined, but only such tenets, which have been heretofore so declared, 1. By the words of the canonical scriptures; 2. By the first four general councils, or such others as have only used the words of the holy Scriptures; or, 3. Which shall hereafter be so declared by the parliament, with the assent of the clergy in convocation. Thus was heresy reduced to a greater certainty than before; though it might not have been the worse to have defined it in terms still more precise and particular: as a man continued still liable to be burnt, for what perhaps he did not understand to be heresy, till the ecclesiastical judge so interpreted the words of the canonical scriptures.

For the writ *de heretico comburendo* remained still in force; and we have instances of its being put in execution upon two Anabaptists in the seventeenth of Elizabeth, and two Arians in the ninth of James I. But it was totally abolished, and heresy again subjected only to ecclesiastical correction, *pro salute anime*, by virtue of the statute 29 Car. II. c. 9.: for, in one and the same reign, our lands were delivered from the slavery of military tenures; our bodies from arbitrary imprisonment by the *habeas corpus* act; and our minds from the tyranny of superstitious bigotry, by demolishing this last badge of persecution in the English law.

Every thing is now as it should be, with respect to the spiritual cognizance, and spiritual punishment of heresy.

Heresy.

Heretic

||
Heriot.

heresy: unless perhaps that the crime ought to be more strictly defined, and no prosecution permitted, even in the ecclesiastical courts, till the tenets in question are by proper authority previously declared to be heretical. Under these restrictions, it seems necessary for the support of the national religion, that the officers of the church should have power to censure heretics; yet not to harass them with temporal penalties, much less to exterminate or destroy them. The legislature hath indeed thought it proper, that the civil magistrate should again interpose, with regard to one species of heresy, very prevalent in modern times; for by statute 9 & 10 W. III. c. 32. if any person educated in the Christian religion, or professing the same, shall by writing, printing, teaching, or advised speaking, deny any one of the persons in the holy Trinity to be God, or maintain that there are more gods than one, he shall undergo the same penalties and incapacities which were just now mentioned to be inflicted on apostasy by the same statute.

HERETIC, a general name for all such persons under any religion, but especially the Christian, as profess or teach religious opinions contrary to the established faith, or to what is made the standard of orthodoxy. See HERESY.

HERETOCHS, among our Saxon ancestors, signified the same with dukes or duces, denoting the commanders or leaders of their armies.

It appears, from Edward the Confessor's laws, that the military force of this kingdom was in the hands of the dukes or heretochs, who were constituted through every province and county in the kingdom, being selected out of the principal nobility, and such as were most remarkable for being *sapientes, fideles, & animosi*. Their duty was to lead and regulate the English armies, with a very unlimited power; and because of their great power, they were elected by the people in their full assembly, or folk-mote, in the same manner as sheriffs were elected.

HERFORDEN, or HERWARDEN, a free and imperial town of Germany, in the circle of Westphalia, and capital of the county of Ravensberg. Here is a famous nunnery belonging to the Protestants of the confession of Augsburg, whose abbess is a princess of the empire, and has a voice and place in the diet. It is seated on the river Aa. E. Long. 8. 47. N. Lat. 52. 12.

HERGUNDT, a town of Upper Hungary, remarkable for its rich mines of vitriol. Those who work in the mines have built a subterraneous town, which has a great number of inhabitants. E. Long. 18. 15. N. Lat. 48. 30.

HERIOT, in law, a customary tribute of goods and chattels, payable to the lord of the fee on the decease of the owner of the land. See TENURE.

Heriot is of two sorts—viz. 1. Heriot-custom, where heriots have been paid time out of mind by custom, after the death of a tenant for life. In some places, there is a customary composition in money, as 10 or 20 shillings in lieu of a heriot, by which the lord and tenant are both bound, if it be an undisputably ancient custom; but a new composition of this sort will not bind the representatives of either party. 2. Heriot-service, when a tenant holds by such service to pay heriot at the time of his death; which service is expressed in the deed of feoffment.—For this latter the lord shall dis-

train; and for the other he shall seize, and not distrain. If the lord purchase part of the tenancy, heriot-service is extinguished; but it is not so of heriot-custom.

HERISSON, in fortification, a beam armed with a great number of iron spikes with their points outwards, and supported by a pivot on which it turns. These serve as a barrier to block up any passage, and are frequently placed before the gates, and more especially the wicket-doors, of a town or fortress, to secure those passages which must of necessity be often opened and shut.

HERITABLE RIGHTS, in Scots law, signify all rights affecting lands, houses, &c. or any immoveable subject.

HERITAGE, in Scots law, lands, houses, or any immoveable subject, in contradistinction to moveables or moveable subjects. It also sometimes signifies such immoveable property as a person succeeds to as heir to another, in contradistinction to that which he himself purchases or acquires in any other manner, called *conquest*.

HERMÆA, in antiquity, ancient Greek festivals in honour of the god Hermes or Mercury. One of these was celebrated by the Pheneatæ in Arcadia; a second by the Cyllenians in Elis; and a third by the Tanagræans, where Mercury was represented with a ram upon his shoulder, because he was said to have walked thro' the city in that posture in time of a plague, and to have cured the sick; in memory of which, it was customary at this festival for one of the most beautiful youths in the city to walk round the walls with a ram upon his shoulder.—A fourth festival of the same name was observed in Crete, when it was usual for the servants to sit down at the table while their masters waited; a custom which was also observed at the Roman Saturnalia.

HERMAN (Paul), a famous botanist in the 17th century, was born at Hall in Saxony. He practised physic in the isle of Ceylon, and was afterwards made professor of botany at Leyden, where he died in 1695. He wrote a catalogue of the plants in the public garden at Leyden, and a work intitled *Flora Lugduno-Batava flores*.

HERMANN (James), a learned mathematician of the academy at Berlin, and a member of the academy of sciences at Paris, was born at Basil in 1678. He was a great traveller, and for six years was professor of mathematics at Padua. He afterwards went to Muscovy, being invited thither by the Czar in 1724. At his return to his native country, he was made professor of morality and natural law at Basil; and died there in 1733. He wrote several mathematical works.

HERMANNIA, in botany: A genus of the pentandria order, belonging to the monodelphia class of plants; and in the natural method ranking under the 37th order, *Columniferae*. The capsule is quinquelocular; the petals at the base are semitubulated and oblique.

Species. 1. The *lavendulifolia*, hath a shrubby stalk and slender branches, very bushy, about a foot and an half high, small, spear-shaped, obtuse and hairy leaves, with clusters of small yellow flowers along the sides of the branches, continuing from June to Autumn. 2. The *althæifolia* hath a shrubby stalk, and soft woolly branches, growing two feet high, with numerous yellow flowers in loose spikes growing at the end of the branches.

Herisson

||

Herman-
nia.

Herman-
stadt.
||
Hermaphrodite.

branches, and making their appearance in July. 3. The *grossularifolia* hath a shrubby stalk and spreading branches, growing three or four feet high, with bright yellow flowers coming out in great numbers at the ends of all the shoots and branches in April or May. 4. The *alnifolia* hath a shrubby stalk and branches growing irregularly four or five feet high, with pale yellow flowers in short spikes from the sides and ends of the branches, appearing in April or May. 3. The *hyssopifolia* hath a shrubby upright stalk, branching out laterally six or seven feet high, with pale yellow flowers in clusters from the sides of the branches, appearing in May and June. There are 14 other species.

Culture. All these plants are natives of Africa, and therefore must be kept in a green-house during the winter in this country. They are propagated by cuttings of their young shoots, which may be planted in pots of rich earth any time from April to July.

HERMANSTADT, a handsome, populous, and strong town of Hungary, capital of Transilvania, with a bishop's see. It is the residence of the governor of the province; and is seated on the river Ceben, in E. Long. 23. 40. N. Lat. 46. 25.

HERMANT (Godfrey), a learned doctor of the Sorbonne, born at Beauvais in 1617. He wrote many excellent works; the principal of which are, 1. The lives of St Athanasius, St Basil, St Gregory Nazianzen, St Chrysostom, and St Ambrose. 2. Four pieces in defence of the rights of the university of Paris against the Jesuits. 3. A French translation of St Chrysostom's treatise of Providence, and St Basil's Ascetics. 4. Extracts from the councils; published after his death, under the title of *Clavis disciplina ecclesiastica*. He died suddenly at Paris in 1690.

HERMAPHRODITE, is generally understood to signify a human creature possessed of both sexes, or who has the parts of generation both of male and female. The term however is applied also to other animals, and even to plants.—The word is formed of the Greek *Ερμαφροδιτος*, a compound of *Ερμης* Mercury, and *Αφροδιτη* Venus; *q. d.* a mixture of Mercury and Venus, *i. e.* of male and female. For it is to be observed, *Hermaphroditus* was originally a proper name, applied by the heathen mythologists to a fabulous deity, whom some represent as a son of *Hermes*, Mercury, and *Aphrodite*, Venus; and who, being desperately in love with the nymph *Salmakis*, obtained of the gods to have his body and hers united into one. Others say, that the god *Hermaphroditus* was conceived as a composition of Mercury and Venus; to exhibit the union between eloquence, or rather commerce, whereof Mercury was god, with pleasure, whereof Venus was the proper deity. Lastly, others think this junction intended to show that Venus (pleasure) was of both sexes; as, in effect, the poet *Calvus* call Venus a god.

Pollentemque Deum Venerem.

As also Virgil, *Aeneid.* lib. ii.

Discedo, ac ducente Deo flammam inter et hostes.

Expeditior —————

M. Spon observes, *Hesychius* calls Venus *Aphroditos*; and *Theophrastus* affirms, that *Aphroditos*, or Venus, is *Hermaphroditus*; and that in the island of Cyprus she has a statue, which represents her with a beard like a man.—The Greeks also call *hermaphrodites* *ανδρογυνες*

androgynei, q. d. men-women. See the article *ANDROGYNES*.

Hermaphrodites

In a treatise by Mr Hunter, in the 69th volume of the *Philosophical Transactions*, hermaphrodites are divided into *natural* and *unnatural* or monstrous. The first belongs to the more simple orders of animals, of which there are a much greater number than of the more perfect. The unnatural takes place in every tribe of animals having distinct sexes, but is more common in some than in others. The human species, our author imagines, has the fewest; never having seen them in that species, nor in dogs; but in the horse, sheep, and black cattle, they are very frequent.

From Mr Hunter's account, however, it does not appear that such a creature as a perfect hermaphrodite has ever existed. All the hermaphrodites which he had the opportunity of seeing had the appearance of females, and were generally saved as such. In the horse they are very frequent; and in the most perfect of this kind he ever saw, the testicles had come down out of the abdomen into the place where the udder should have been, and appeared like an udder, not so pendulous as the scrotum in the male of such animals. There were also two nipples, of which horses have no perfect form; being blended in them with the sheath or prepuce, of which there was none here. The external female parts were exactly similar to those of a perfect female; but instead of a common-sized clitoris, there was one about five or six inches long; which when erect, stood almost directly backwards.

A foal ass very similar to the above was killed, and the following appearances were observed on dissection. The testicles were not come down as in the former, possibly because the creature was too young. It had also two nipples; but there was no penis passing round the pubes to the belly, as in the perfect male ass. The external female parts were similar to those of the she-ass. Within the entrance of the vagina was placed the clitoris; but much longer than that of a true female, being about five inches long. The vagina was open a little farther than the opening of the urethra into it, and then became obliterated; from thence, up to the fundus of the uterus, there was no canal. At the fundus of the common uterus it was hollow, or had a cavity in it, and then divided into two, viz. a right and a left, called the *horns* of the uterus, which were also pervious. Beyond the termination of the two horns were placed the ovaria, as in the true female; but the Fallopian tubes could not be found.—From the broad ligaments, to the edges of which the horns of the uterus and ovaria were attached, there passed towards each groin a part similar to the round ligaments in the female, which were continued into the rings of the abdominal muscles; but with this difference, that there were continued with them a process or theca of the peritonæum, similar to the tunica vaginalis communis in the male ass; and in these thecæ were found the testicles, but no vasa deferentia could be observed passing from them.

In most species of animals, the production of hermaphrodites appears to be the effect of chance; but in the black cattle it seems to be an established principle of their propagation. It is a well-known fact, and, as far as hath yet been discovered, appears

Hermaphrodite.

to be universal, that when a cow brings forth two calves, one of them a bull, and the other a cow to appearance, the cow is unfit for propagation, but the bull-calf becomes a very proper bull. They are known not to breed; they do not even show the least inclination for the bull, nor does the bull ever take the least notice of them. Among the country people in England, this kind of calf is called a *free-martin*; and this singularity is just as well known among the farmers as either cow or bull. When they are preserved, it is for the purposes of an ox or spayed heifer; viz. to yoke with the oxen, or fatten for the table. They are much larger than either the bull or the cow, and the horns grow longer and bigger, being very similar to those of an ox. The bellow of a free-martin is also similar to that of an ox, and the meat is similar to that of the ox or spayed heifer, viz. much finer in the fibre than either the bull or cow; and they are more susceptible of growing fat with good food. By some they are supposed to exceed the ox and heifer in delicacy of taste, and bear a higher price at market; this, however, does not always hold, and Mr Hunter gives an instance of the contrary. The Romans, who called the bull *taurus*, spoke also of *tauræ* in the feminine gender different from cows. Stephens observes, that it was thought they meant by this word *barren cows*, who obtained the name because they did not conceive any more than bulls. He also quotes a passage from Columella, *lib. vi. cap. 22.* "And, like the *tauræ*, which occupy the place of fertile cows, should be rejected or sent away." He likewise quotes Varro, *De re rustica*, *lib. ii. cap. 5.* "The cow which is barren is called *tauræ*." From which we may reasonably conjecture, that the Romans had not the idea of the circumstances of their production.

Of these creatures Mr Hunter dissected three, and the following appearances were observed in the most perfect of them.—The external parts were rather smaller than in the cow. The vagina passed on as in the cow to the opening of the urethra, and then it began to contract into a small canal, which passed on to the division of the uterus into the two horns; each horn passing along the edge of the broad ligament laterally towards the ovaria. At the termination of these horns were placed both the ovaria and testicles, both of which were nearly about the size of a small nutmeg. No Fallopian tubes could be found. To the testicles were vasa deferentia, but imperfect. The left one did not come near the testicle; the right only came close to it, but did not terminate in the body called *epididymis*. They were both pervious, and opened into the vagina near the opening of the urethra.—On the posterior surface of the bladder, or between the uterus and bladder, were the two bags called the *vesiculæ seminales* in the male, but much smaller than what they are in the bull: the ducts opened along with the vasa deferentia.

Concerning hermaphrodites of the human species, much has been written, and many laws enacted about them in different nations; but the existence of them is still disputed. Dr Parsons has given us a treatise on the subject, in which he endeavours to explode the notion as a vulgar error. According to him, all the hermaphrodites that have appeared, were only women whose clitoris from some cause or other was overgrown;

N^o 152.

and, in particular, that this was the case with an Angola woman shown at London as an hermaphrodite some time ago.

Among the reptile tribe, indeed, such as worms, snails, leeches, &c. hermaphrodites are very frequent. In the memoirs of the French academy, we have an account of this very extraordinary kind of hermaphrodites, which not only have both sexes, but do the office of both at the same time. Such are earth-worms, round-tailed worms found in the intestines of men and horses, land-snails, and those of fresh waters, and all the sorts of leeches. And, as all these are reptiles, and without bones, M. Poupert concludes it probable, that all other insects which have these two characters are also hermaphrodites.

The method of coupling practised in this class of hermaphrodites, may be illustrated in the instance of earth-worms. These little creatures creep, two by two, out of holes proper to receive them, where they dispose their bodies in such a manner, as that the head of the one is turned to the tail of the other. Being thus stretched lengthwise, a little conical button or papilla is thrust forth by each, and received into an aperture of the other. These animals, being male in one part of the body, and female in another, and the body flexible withal, M. Homberg does not think it impossible but that an earth-worm may couple with itself, and be both father and mother of its young; an observation which, to some, appears highly extravagant!

Among the insects of the soft or boneless kind, there are great numbers indeed; which are so far from being hermaphrodites, that they are of no sex at all. Of this kind are all the caterpillars, maggots, and worms, produced of the eggs of flies of all kinds: but the reason of this is plain; these are not animals in a perfect state, but disguises under which animals lurk. They have no business with the propagating of their species, but are to be transformed into animals of another kind, by the putting off their several coverings, and then only they are in their perfect state, and therefore then only show the differences of sex, which are always in the distinct animals, each being only male or female. These copulate, and their eggs produce these creatures, which show no sex till they arrive at that perfect state again.

HERMAPHRODITE *Flowers*, in botany. These are so called by the sexualists on account of their containing both the antheræ and stigma, the supposed organs of generation, within the same calyx and petals. Of this kind are the flowers of all the classes in Linnæus's sexual method, except the classes *monœcia* and *diœcia*; in the former of which, male and female flowers are produced on the same root; in the latter, in distinct plants from the same seed.—In the class *polygamia*, there are always hermaphrodite flowers mixed with male or female, or both, either on the same or distinct roots. In the plantain-tree the flowers are all hermaphrodite; in some, however, the antheræ or male organ, in others the stigma or female organ, proves abortive. The flowers in the former class are styled *female hermaphrodites*; in the latter, *male hermaphrodites*.—Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare and scarce in the animal one.

Hermaphrodite.

Hermas,
Hermes.

HERMAS, an ecclesiastical author of the first century; and, according to Origen, Eusebius, and Jerome, the same whom St Paul salutes in the end of his epistle to the Romans. He wrote a book in Greek some time before Domitian's persecution, which happened in the year 95. This work is intitled *The Pastor*, from his representing an angel speaking to him in it under the form of a shepherd. The Greek text is lost, but a very ancient Latin version of it is still extant. Some of the fathers have considered this book as canonical. The best edition of it is that of 1698, where it is to be found among the other apostolical fathers, illustrated with the notes and corrections of Cotelierius and Le Clerc. With them it was translated into English by Archbishop Wake, the best edition of which is that of 1710.

HERMAS, in botany: A genus of the monoecia order, belonging to the polygamia class of plants. The umbel in the hermaphrodite is terminal; there is an universal involucre and partial ones. The rays of the small umbels are lobed; the central one flower-bearing; there are five petals, and as many barren stamens; the seeds are two fold and suborbicular. In the male the lateral umbels have universal and partial involucre; the small umbels are many-flowered; there are five petals, and five fertile stamens.

HERMES, or **HERMA**, among antiquaries, a sort of square or cubical figure of the god Mercury, usually made of marble, though sometimes of brass or other materials, without arms or legs, and planted by the Greeks and Romans in their cross-ways.

Servius gives us the origin thereof, in his comment on the eighth book of the *Æneid*. Some shepherds, says he, having one day caught Mercury, called by the Greeks *Hermes*, asleep on a mountain, cut off his hands; from which he, as well as the mountain where the action was done, became denominated Cyllenius, from *κυλλαιος* maimed: and thence, adds Servius, it is that certain statues without arms are denominated *Hermeses* or *Hermæ*. But this etymology of the epithet of Cyllenius contradicts most of the other ancient authors; who derive it hence, that Mercury was born at Cyllene, a city of Elis, or even on the mountain Cyllene itself, which had been thus called before him.

Suidas gives a moral explication of this custom of making statues of Mercury without arms. The *Hermeses*, says he, were statues of stone placed at the vestibules or porches of the doors and temples at Athens; for this reason, that as Mercury was held the god of speech and of truth, square and cubical statues were peculiarly proper; having this in common with truth, that on what side soever they are viewed, they always appear the same.

It must be observed, that Athens abounded more than any other place in *Hermeses*: there were abundance of very signal ones in divers parts of the city, and they were indeed one of the principal ornaments of the place. They were also placed in the high-roads and cross-ways, because Mercury, who was the courier of the gods, presided over the highways; whence he had his surname of *Trivius*, from *trivium*; and that of *Viacus*, from *via*.

From Suidas's account, above-cited, it appears, that the terms *termini*, used among us in the door-cases, balconies, &c. of our buildings, take their origin from

these Athenian *Hermeses*; and that it was more proper to call them *hermetes* than *termini*, because, though the Roman *termini* were square stones, whereon a head was frequently placed, yet they were rather used as landmarks and mere stones than as ornaments of building. See the articles **MERCURY** and **THOTH**.

HERMETIC, or *HERMETICAL-Art*, a name given to chemistry, on a supposition that *Hermes Trismegistus* was the inventor thereof, or that he excelled therein. See **THOTH**.

HERMETICAL Philosophy is that which undertakes to solve and explain all the phenomena of nature, from the three chemical principles, salt, sulphur, and mercury.

HERMETICAL Physic, or *Medicine*, is that system or hypothesis in the art of healing, which explains the causes of diseases, and the operations of medicine, on the principles of the hermetical philosophy, and particularly on the system of alkali and acid.

HERMETICAL Seal, a manner of stopping or closing glass vessels, for chemical operations, so very accurately, that nothing can exhale or escape, not even the most subtle spirits. It is performed by heating the neck of the vessel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twisting it close together. This they call putting on *Hermes's seal*. There are also other ways of sealing vessels hermetically; viz. by stopping them with a plug or stopple of glass, well luted into the neck of the vessel; or, by turning another ovum philosophicum upon that wherein the matter is contained.

HERMHARPOCRATES, or **HERMARPOCRATES**, in antiquity, a deity, or figure of a deity, composed of Mercury, and Harpocrates the god of Silence.

M. Spon gives us a *hermharpocrates* in his *Rech. Cur. de l'Antiquité*, p. 98. fig. 15. having wings on his feet like Mercury, and laying his finger on his mouth like Harpocrates. It is probable they might mean, by this combination, that silence is sometimes eloquent.

HERMIANI, or **HERMIATITÆ**, a sect of heretics in the second century, thus called from their leader Hermias. They were also denominated *Seleuciani*.

One of their distinguishing tenets was, that God is corporeal. Another, that Jesus Christ did not ascend into heaven with his body, but left it in the sun.

HERMIONE (anc. geog.), a considerable city of Argolis. It was in ruins (except a few temples) in the time of Pausanias; who says that the new city was at the distance of four stadia from the promontory on which the temple of Neptune stood. It gave name to the Sinus Hermionicus, a part of the Sinus Argolicus.

HERMIT, or **EREMIT**, *Eremita*, a devout person retired into solitude, to be more at leisure for prayer and contemplation, and to disencumber himself of the affairs of this world.—The word is formed from the Greek *ερημος*, desert or wilderness; and, according to the etymology, should rather be wrote *Eremit*.

Paul surnamed the *Hermit*, is usually reckoned the first hermit; though St Jerome at the beginning of the life of that saint says, it is not known who was the first.—Some go back to John the Baptist, others to Elias: others make St Anthony the founder of the eremitical life; but others think that he only rekindled

Hermetic
||
Hermit.

Hermit
||
Hermogenians.

led and heightened the fervour thereof, and hold that the disciples of that saint owned St Paul of Thebes for the first that practised it. The persecutions of Decius and Valerian are supposed to have been the occasion.—Several of the ancient hermits, as St Anthony, &c. though they lived in deserts, had yet numbers of religious accompanying them.

There are also various orders and congregations of religious distinguished by the title of *hermits*; as, hermits of St Augustine, of St John Baptist, of St Jerom, of St Paul, &c.

HERMIT (Gaytier Peter the), a French officer of Amiens in Picardy, who quitted the military profession, and commenced hermit and pilgrim. Unfortunately, he travelled to the Holy Land about the year 1093; and making a melancholy recital of the deplorable situation of a few Christians in that country to Pope Urban II. and at the same time enthusiastically lamenting that Infidels should be in possession of the famous city where the Author of Christianity first promulgated his sacred doctrines, Urban gave him a fatal commission to excite all Christian princes to a general war against the Turks and Saracens the possessors of the Holy Land. See CRUSADES.

HERMITAGE properly signifies a little hut or habitation, in some desert place, where a hermit dwells.

Hermitage is also popularly attributed to any religious cell, built and endowed in a private and reclusive place, and thus annexed to some large abbey, of which the superior was called *hermita*.

HERMODACTYL, in the materia medica, a root brought from Turkey. It is of the shape of a heart flatted, of a white colour, compact, yet easy to cut or powder; of a viscous sweetish taste, with a light degree of acrimony. *Hermodactyls* were of great repute among the ancients as a cathartic; but those we now meet with in the shops have very little purgative virtue; Neumann declares he never found them to have any effect at all.—The *hermodactyl* is the root of the *Colchicum variegatum*, according to some; others suppose it to be the root of the *Iris tuberosa*.

HERMOGENES, the first and most celebrated architect of antiquity, was, according to Vitruvius, born at Alanbada, a city in Caria. He built a temple of Diana at Magnesia; another of Bacchus at Tros; and was the inventor of several parts of architecture. He composed a book on the subject, which is lost.

HERMOGENES-Tarsensis, a rhetorician and orator, and who was in every respect a prodigy. At 17 years of age he published his system of rhetoric, and at 20 his philosophic ideas: but at 25 he forgot every thing he had known. It is said, that his body being opened after his death, his heart was found of an extraordinary size, and all over hairy. He died about 168 B. C.

HERMOGENIANS, a sect of ancient heretics, denominated from their leader Hermogenes, who lived towards the close of the second century. Hermogenes established matter as his first principle; and regarding matter as the fountain of all evil, he maintained that the world, and every thing contained in it, as also the souls of men and other spirits, were formed by the Deity from an uncreated and eternal mass of corrupt

matter. The opinions of Hermogenes, with regard to the origin of the world and the nature of the soul, were warmly opposed by Tertullian.

The Hermogenians were divided into several branches under their respective chieftains, viz. Hermiani, Seleucians, Materiari, &c.

HERMON, or AERMON (anc. geog.); a mountain of the Amorites, called *Sanior* by the Phœnicians, and *Sanir* or *Senir* by the Amorites, on the east of Jordan. It is also called *Sion*, (Moses); but must not be confounded with the Sion of Jerusalem. By the Sidonians it was called *Scirion*; in the vulgate, it is called *Sarion*. Joshua informs us, that it was the dominion of Og king of Bashan; which must be understood of its south side. It is never particularly mentioned by profane writers; being comprised under the appellation *Libanus*, or *Antilibanus*, with which mountain it is joined to the east. It is also called *Hermomim* plurally, Psalm xlii. 6. because it was extensive, and contained several mountains.

HERMUS, (anc. geog.), a river of Ionia; which rising near Dorylæum, a town of Phrygia, in a mountain sacred to Dindymene or Cybele, touched Mysia, and ran through the Regio Combusta, then through the plains of Smyrna down to the sea, carrying along with it the Pactolus, Hyllus, and other less noble rivers. Its waters were said to roll down gold, by Virgil and other poets.

HERNANDRIA, JACK-IN-A-BOX-TREE: A genus of the triandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, *Tricocca*. The male calyx is tripartite; the corolla tripetalous; the female calyx is truncated, quite entire; the corolla hexapetalous; the plum hollow, and open at the mouth or upper part, with a loose kernel.

Species. 1. The sonora, or common jack-in-a-box, is a native of both the Indies. It grows 20 or 30 feet high; and is garnished with broad peltated leaves, and monœcious flowers, succeeded by a large swollen hollow fruit formed of the calyx; having a hole or open at the end, and a hard nut within. The wind blowing into the cavity of this fruit makes a very whistling and rattling noise, whence comes the name. 2. The ovigera grows many feet high, garnished with large oval leaves not peltated; and monœcious flowers, succeeded by a swollen fruit open at the end, and a nut within.

Uses. The sonora, in Java, affords a sure antidote against poison, if you either put its small roots on the wounds or eat them; as was discovered to Rumphius by a captive woman in the war between the people of Macassar and the Dutch in the year 1667. The soldiers of the former always carry this root about them, as a remedy against wounds with poisonous arrows.

Culture. Both these plants being tender exotics, must be planted in pots of rich earth, and always kept in a hot house; in which, notwithstanding all the care that can be taken, they seldom flower, and never grow beyond the height of common shrubs, tho' in the places where they are natives they arrive at the height of trees. They are propagated by seeds procured from the West Indies.

HERNE, a town of Kent, 6 miles from Canterbury, 12 from Margate, and 14 from Faversham. It formerly

Hermion
||
Herne.

Hernia
||
Hero.

merly had a market, and has now a fair on Easter-Tuesday. The church is a large ancient structure, with a tower of flint, and has six stalls of the cathedral kind, with divisions of the choir from the nave by a carved screen of oak. The church is 113 feet long. The stone font is very ancient. Here the great Dr Ridley, the English martyr, was vicar. Here is a commodious bay, frequented by colliers, &c.

HERNIA, in medicine and surgery, a descent of the intestines or omentum out of their natural place; or rather, the tumour formed by that descent, popularly called a rupture. The word is Latin, *hernia*, and originally signifies the same with *tumor scroti*, called also *ramex*. Priscian observes, that the ancient Marſi gave the appellation *hernia* to rocks; whence some will have hernias thus called *propter duritiem*, on account of their hardness. Scaliger chooses rather to derive the word from the Greek *εἶδος*, *ramus*, branch. See (*Index* to) SURGERY.

HERNIARIA, RUPTURE-WORT: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 11th order, *Sarmentacea*. The calyx is quinque partite; there is no corolla; there are five barren stamina, and a monospermous capsule.

Species. There are four species, of which the only remarkable one is the *glabra*, or smooth rupture-wort, a native of many parts of England. It is a low trailing plant, with leaves like the smaller chickweed; the flowers come out in clusters from the side of the stalks at the joints, and are of a yellowish green colour.

Uses, &c. This plant is a little saltish and astringent. The juice takes away specks in the eye. Cows, sheep, and horses, eat the plant; goats and swine refuse it.

HERO, in Pagan mythology, a great and illustrious person, of a mortal nature, though supposed by the populace to partake of immortality, and after his death to be placed among the number of the gods. The word is formed of the Latin *heros*, and that of the Greek *ἥρως* *femi-deus*, "demi-god"—The Greeks erected columns and other monuments over the tombs of their heroes, and established a kind of worship in honour of the manes both of their heroes and heroines. The Romans also raised statues in honour of their heroes; but there were six of their heroes of a superior order, and who were supposed to be admitted into the community of the twelve great gods: these were Hercules, Bacchus, Esculapius, Romulus, Castor, and Pollux. Writers have distinguished between the worship which the ancients paid to their heroes and that offered to their gods. The latter, it is said, consisted of sacrifices and libations; the former was only a kind of funeral honour, in which they celebrated their exploits, concluding the rehearsal with feasts.

HERO is also used in a more extensive sense, for a great, illustrious, and extraordinary personage; particularly in respect of valour, courage, intrepidity, and other military virtues.

F. Bouhours makes this distinction between a great man and a hero, that the latter is more daring, fierce, and enterprising; and the former more prudent, thoughtful, and reserved. In this sense we properly say, Alexander was a hero, Julius Cæsar a great man.

HERO of a poem or romance, is the principal personage, or he who has the chief part in it. Thus the hero of the Iliad is Achilles; of the Odyssey, Ulysses; of the Æneid, Æneas; of Tasso's Jerusalem, Godfrey of Bulloign; of Milton's Paradise Lost, Adam; though Mr Dryden will have the devil to be Milton's hero, because he gets the better of Adam, and drives him out of Paradise.

HERO, in fabulous history, a famous priestess of Venus, lived at Abydos, in a tower situated on the banks of the Hellespont. She being beloved by Leander, who lived at Sestos on the other side of the strait, he every night swam over to visit her, being directed by a light fixed on the tower. But the light being put out in a stormy night, the youth missed his way, and was drowned; on which Hero threw herself into the sea, and perished.

HERO, the name of two celebrated Greek mathematicians; the one called the *old*, and the other the *young*, Hero. The younger was a disciple of Ctesibius. They are known by two works translated into Latin by Barochius: *Spiralium liber*, by Hero senior; and *Traſlat. artis et machin. militar.* by Hero junior. They flourished about 130 and 100 B. C.

HEROD, falsely styled the *Great*, king and execrable tyrant of Judæa; who, on the strength of a misinterpreted prophecy, caused all the male children of Bethlehem and its neighbourhood to be massacred by his soldiers at the time of the birth of Christ, in the vain hope of destroying the Saviour of mankind. He died, eaten with worms, two or three years after the birth of our Saviour, at the age of 71, after a reign of 40 years. He had ordered that all the persons of quality, whom he kept in prison, should be massacred the moment the breath was out of his body, in order that every considerable family in the kingdom might shed tears at his death; but that inhuman order was not executed.

HERODIAN, an eminent Greek historian, who spent the greatest part of his life at Rome, flourished in the third century, in the reigns of Severus, Caracalla, Heliogabalus, Alexander, and Maximin. His history begins from the death of Marcus Aurelius the philosopher; and ends with the death of Balbinus and Maximin, and the beginning of the reign of Gordian. It is written in very elegant Greek; and there is an excellent translation of it into Latin, by Angelus Politianus. Herodian has been published by Henry Stephens in 4to, in 1581; by Boecler, at Strasburg, in 1662, 8vo; and by Hudson, at Oxford, in 1699, 8vo.

HERODIANS, a sect among the Jews at the time of our Saviour; mentioned Math. xxii. 16. Mark iii. 6.

The critics and commentators are very much divided with regard to the Herodians. St Jerom, in his Dialogue against the Luciferians, takes the name to have been given to such as owned Herod for the Messiah; and Tertullian and Epiphanius are of the same opinion. But the same Jerom, in his Comment on St Matthew, treats this opinion as ridiculous; and maintains, that the Pharisees gave this appellation by way of ridicule to Herod's soldiers who paid tribute to the Romans; agreeable to which the Syrian interpreters render the word by *the domestics of Herod*, i. e. "his courtiers."

Hero
||
Herodians.

Herodotus. courtiers." M. Simon, in his notes on the 22d chapter of Matthew, advances a more probable opinion. The name *Herodian* he imagines to have been given to such as adhered to Herod's party and interest; and were for preserving the government in his family, about which were great divisions among the Jews.—F. Hardouin will have the Herodians and Sadducees to have been the same.—Dr Prideaux is of opinion that they derived their name from Herod the Great, and that they were distinguished from the other Jews by their concurrence with Herod's scheme of subjecting himself and his dominions to the Romans, and likewise by complying with many of their heathen usages and customs. This symbolizing with idolatry upon views of interest and worldly policy, was probably that leaven of Herod, against which our Saviour cautioned his disciples. It is farther probable that they were chiefly of the sect of Sadducees; because the leaven of Herod is also denominated the leaven of the Sadducees.

HERODOTUS, an ancient Greek historian of Halicarnassus in Caria, son of Lyxus and Dryo, was born in the first year of the 74th Olympiad, that is, about 484 B. C. The city of Halicarnassus being at that time under the tyranny of Lygdamis grandson of Artemisia queen of Caria, Herodotus quitted his country and retired to Samos; from whence he travelled over Egypt, Greece, Italy, &c. and in his travels acquired the knowledge of the history and origin of many nations. He then began to digest the materials he had collected into order, and composed that history which has preserved his name among men ever since. He wrote it in the isle of Samos, according to the general opinion.—Lucian informs us, that when Herodotus left Caria to go into Greece, he began to consider with himself,

What he should do to be for ever known
And make the age to come his own,

in the most expeditious way, and with as little trouble as possible. His history, he presumed, would easily procure him fame, and raise his name among the Grecians in whose favour it was written: but then he foresaw that it would be very tedious to go through the several cities of Greece, and recite it to each respective city; to the Athenians, Corinthians, Argives, Lacedemonians, &c. He thought it most proper therefore to take the opportunity of their assembling all together; and accordingly recited his work at the Olympic games, which rendered him more famous than even those who had obtained the prizes. None were ignorant of his name, nor was there a single person in Greece who had not seen him at the Olympic games, or heard those speak of him who had seen him there.

His work is divided into nine books; which, according to the computation of Dionysius Halicarnassensis, contain the most remarkable occurrences within a period of 240 years; from the reign of Cyrus the first king of Persia, to that of Xerxes when the historian was living. These nine books are called after the names of the nine muses, each book being distinguished by the name of a muse; and this has given birth to two disquisitions among the learned: 1. Whether they were so called by Herodotus himself; and, 2. For what reason they were so called. As to the first, it is generally agreed that Herodotus did not impose these names himself; but it is not agreed why they were

imposed by others. Lucian tells us, that these names were given them by the Grecians at the Olympic games, when they were first recited, as the best compliment that could be paid the man who had taken pains to do them so much honour. Others have thought that the names of the *muses* have been fixed upon them by way of reproach; and were designed to intimate, that Herodotus, instead of true history, had written a great deal of fable. But, be this as it will, it is certain, that with regard to the truth of his history, he is accused by several authors; and, on the other hand, he has not wanted persons to defend him. Aldus Manutius, Joachim Camerarius, and Henry Stephens, have written apologies for him; and, among other things, have very justly observed, that he seldom relates any thing of doubtful credit without producing the authority on which his narration is founded; and, if he has no certain authority to fix it upon, uses always the terms *ut ferunt, ut ego audiivi, &c.*

There is ascribed also to Herodotus, but falsely, a Life of Homer, which is usually printed at the end of his work.—He wrote in the Ionic dialect, and his style and manner have ever been admired by all people of taste. There have been several editions of the works of this historian; two by Henry Stephens, one in 1570. and the other in 1592; one by Gale at London in 1679; and one by Gronovius at Leyden in 1715, which is the last and best, though not the best printed.

HEROIC, something belonging to a hero, or heroine. Thus we say, *heroic actions, heroic virtue, heroic style, heroic verse, heroic poet, heroic age, &c.*

HEROIC AGE, is that age or period of the world wherein the *heroes*, or those called by the poets the *children of the gods*, are supposed to have lived.—The heroic age coincides with the fabulous age.

HEROIC POEM is that which undertakes to describe some extraordinary action, or enterprize. Homer, Virgil, Statius, Lucan, Tasso, Camoens, Milton, and Voltaire, have composed *heroic poems*. In this sense, *heroic poem* coincides with *epic poem*.

HEROIC VERSE, is that wherein heroic poems are usually composed; or, it is that proper for such poems. In the Greek and Latin, hexameter verses are peculiarly denominated *heroic verses*, as being alone used by Homer, Virgil, &c. Alexandrine verses, of 12 syllables, were formerly called *heroic verses*, as being supposed the only verse proper for heroic poetry; but later writers use verses of ten syllables.

HEROINE, HEROINA, or Herois, a woman that has the qualities and virtues of a hero, or that has done some heroic action.

HERON, in ornithology. See ARDEA.

This bird is a very great devourer of fish, and will do more mischief to a pond than even an otter. Some say that an heron will destroy more fish in a week than an otter will in three months; but that seems carrying the matter too far. People who have kept herons, have had the curiosity to number out the fish they fed them with into a tub of water; and counting them again afterwards, it has been found that a heron will eat 50 moderate-sized dace and roaches in a day. It has been found, that in carp-ponds visited by this bird, one heron will eat up 1000 store carp in a year, and will hunt them so close that very few can escape. The readiest method of destroying this mischievous bird is by fishing for him in the manner of pike, with a baited

Herodotus
||
Heron.

Herpes baited hook; the bait consisting of small roach or dace, and the hook fastened to one end of a strong line, made of silk and wire twisted together. To the other end of the line is fastened a stone of a pound weight; and several of these baited lines being sunk by means of the stone in different parts of the pond, in a night or two the heron will not fail of being taken by one or other of them.

HERPES, in medicine, a bilious pustule, which breaking out in different manners upon the skin, accordingly receives different denominations. See (the *Index* subjoined to) **MEDICINE**.

HERRERA TORDESILLAS (Anthony), a Spanish historian, was secretary to Vespasian Gonzaga viceroy of Naples, and afterwards historiographer of the Indies, under king Philip II. who allowed him a considerable pension. He wrote a general history of the Indies, in Spanish, from 1492 to 1554; and of the world (not so much esteemed), from 1554 to 1598. He died in 1625, aged about 66.

HERRERA (Ferdinand de), an eminent Spanish poet, of the 16th century, was born at Seville, and principally succeeded in the lyric kind. Besides his poems, he wrote notes on Garcilasso de la Vega, and an account of the war of Cyprus, and the battle of Lepanto, &c.

HERRING, in ichthyology, a species of **CLUPEA**.

The name *herring* is derived from the German *beer*, an army, which expresses their number, when they migrate into our seas. Herrings are found in great plenty from the highest northern latitudes as low as the northern coasts of France. They are also met with in vast shoals on the coast of America, as low as Carolina: they are found also in the sea of Kamtschatka, and possibly reach Japan: but their winter rendezvous is within the arctic circle, whither they retire after spawning, and where they are provided with plenty of insect food. For an account of the remarkable migration of herrings, and the history of the fishery, &c. see **CLUPEA** and *Herring-FISHERY*.

They are in full roe at the end of June, and continue in perfection till the beginning of winter, when they begin to deposite their spawn.

There are different names given to preserved herrings, according to the different manners wherein they are ordered: as, 1. *Sea-sticks*; which are such as are caught all the fishing season, and are but once packed. A barrel of these holds six or eight hundred; eight barrels go to the tun by law; a hundred of herrings is to be a hundred and twenty; a last is ten thousand, and they commonly reckon fourteen barrels to the last. 2. There are others, repacked on shore, called *repacked herrings*; seventeen barrels of sea-sticks commonly make from twelve to fourteen of repacked herrings. The manner of repacking them is, to take out the herrings, wash them out in their own pickle, and lay them orderly in a fresh barrel: these have no salt put to them, but are close packed, and headed up by a sworn cooper, with pickle, when the barrel is half full. The pickle is brine; so strong as that the herring will swim in it. 3. *Summers*, are such as the Dutch chafers or divers catch from June to the 15th of July. These are sold away in sea-sticks, to be spent presently, in regard of their fatness; because they will not endure repacking. They go one with another, full and shot.

VOL. VIII. Part II.

ten; but the repacked herrings are sorted, the full herrings by themselves. 4. The *shotten* and *sick herrings* by themselves; the barrel whereof is to be marked distinctly. 5. *Crux herrings*; which are such as are caught after the 14th of September. These are cured with that kind of salt called salt upon salt, and are carefully sorted out, all full herrings, and used in the repacking. 6. *Corved herrings*. These serve to make red herrings, being such as are taken in the Yarmouth seas, from the end of August to the middle of October; provided they can be carried ashore within a week, more or less, after they are taken. These are never gipped, but rowed in salt, for the better preserving of them, till they can be brought on shore; and such as are kept to make *red-herrings* are washed in great vats in fresh water, before they are hung up in the *herring-hangs* or *red-herring* houses.

As for the *manner of salting herrings*. The nets being haled on board, the fishes are taken out, and put into the warbacks, which stand on one side of the vessels. When all the nets are thus unloaded, one fills the gippers baskets. The gippers cut their throats, take out their guts, and fling out the full herrings into one basket, and the shotten into another. One man takes the full basket when they are gipped, and carries them to the rower-back, wherein there is salt. One boy rows and stirs them about in the salt, and another takes them, thus rowed, and carries them in baskets to the packers. Four men pack the herrings into one barrel, and lay them, one by one, straight and even; and another man, when the barrel is full, takes it from the packers. It is left to stand a day, or more, open to settle, that the salt may melt and dissolve to pickle; after which it is filled up, and the barrel headed. The pickle is to be strong enough to sustain a herring; otherwise the fish decay in it.

HERRING (Thomas), archbishop of Canterbury, was the son of the rev. Mr John Herring, rector of Walsoken in Norfolk, where he was born in 1693. He was educated at Jesus-college, Cambridge; was afterwards chosen fellow of Corpus Christi College, and continued a tutor there upwards of seven years. Having entered into priest's orders in 1719, he was successively minister of Great Shelford, Stow cum Qui, and Trinity in Cambridge; chaplain to Dr Fleetwood, bishop of Ely; rector of Rettringdon in Essex, and of Barly in Hertfordshire; preacher to the Society of Lincoln's Inn, chaplain in ordinary to his late majesty, rector of Blechingly in Surry, and dean of Rochester. In 1737 he was consecrated bishop of Bangor, and in 1743 translated to the archiepiscopal see of York. On the death of Dr Potter in 1747, he was translated to the see of Canterbury; but in 1753 was seized with a violent fever, which brought him to the brink of the grave; and after languishing about four years, he died on the 13th of March 1757. He expended upwards of six thousand pounds in repairing and adorning the palaces of Croydon and Lambeth. This worthy prelate, in a most eminent degree, possessed the virtues of public life; his mind was filled with unaffected piety and benevolence, he was an excellent preacher, and a true friend to religious and civil liberty. After his death was published a volume of his sermons on public occasions.

HERRNHUT, or **HERRNHUTH**, the first and most

3 O 3

considerable

Herrnhut considerable settlement of the United Brethren, commonly called *Moravians*, situated in Upper Lusatia, upon an estate belonging to the family of Nicolas Lewis Count Zinzendorf, about 50 miles east of Dresden. See the article *UNITED Brethren*.

The building of this place was begun in 1727 by some emigrants from Moravia, who forsook their possessions on account of the persecution they suffered as Protestants from the Roman Catholics; and being well received by Count Zinzendorf, cleared a spot of ground allotted to them by him upon the rise of an hill called the *Hutberg*, or Watch-hill, from which they took occasion to call the new settlement *Herrnhut*, or the Watch of the Lord. More emigrants taking refuge with them, and many other persons joining their congregation, the buildings increased considerably; and at present Herrnhut is a regular and well built village, containing about 1300 inhabitants, all members of the Church of the United Brethren. Besides the minister and his assistants, a warden is appointed, who presides in the vestry, and superintends the temporal concerns of the settlement. The Brethren distinguish themselves by a plain and uniform dress, the women having retained the dress of the countries from which the first emigrants proceeded, not from any superstitious attachment to old forms, but from a desire to preclude vanity and useless expence. As most of the settlements of this community resemble each other, both in the disposition of their buildings and in their internal regulations, we will give a short sketch of Herrnhut, as the pattern from which the rest were copied, though there are others in which the buildings are more regularly planned. The chapel, which is situated in a large square, is a spacious and neat building, furnished with a good organ and moveable forms, but no pews. The men sit on one side, and the women on the other, entering at separate doors. Besides the usual Sunday's service, the congregation meets here every evening and the children every morning. The dwellings of the minister and warden of the congregation form one, and a school-house the other, wing to the chapel. From the chapel an avenue of trees leads to the burying-ground, which is a large square field on the declivity of the *Hutberg*, and at some distance from the village. Several walks bordered by trees, and furnished with seats, surround and intersect it. The grave-stones and graves are all of equal size, and placed in regular rows; only the vault of Count Zinzendorf, as lord of the manor, is larger than the rest. Burials are performed with great solemnity, but no mourning dresses used.—On one side of the square, in which the chapel stands, is a large building, inhabited by the single men, with workshops, out-houses, and gardens, exclusive of the dwelling rooms. The main building contains a neat chapel, in which a short morning and evening service is performed for the inhabitants; a dining-hall; and a dormitory, in which each has a separate bed. The latter is a lofty room, furnished with large windows and ventilators, so as to admit and preserve a pure air. For the sick, apartments are allotted, and sick waiters appointed. The number of inhabitants in one room is proportioned to its size, but there are many who have rooms to themselves. No one lives here by compulsion. Each in-

habitant pays for rent and board a moderate sum, fixed by a committee of overseers, in which the warden of the house presides; whose business it is to maintain good order, attend to the external welfare of the house and its inhabitants, and by his advice and activity to prevent every evil arising from external sources. Besides the warden, an unmarried clergyman resides in the house, appointed to attend to the moral conduct and spiritual concerns of all the single men belonging to the congregation. He hears their complaints, assists them with good advice, and uses all his influence for their benefit, and for the prevention of any evil that would undermine their spiritual happiness.—On the other side of the square is another large building, inhabited by single women; with a chapel, dining hall, dormitory, and a large garden. The internal regulations are exactly the same with those of the house of the single men. There are likewise houses for widowers and widows, who find in them an agreeable retreat, with board and lodging. The poor are cared for and maintained; for which purpose several charitable institutions exist in the congregation.—The manor-house, the house of Count Reuss, the shop and linen warehouses, are the most considerable buildings in Herrnhut; the family houses are built in regular streets, opening into the square. Both the streets and houses are kept clean; and besides a watchman at night, an officer is appointed to attend to good order in the day. All strangers are treated with civility; but neither drunken nor disorderly visitors nor beggars are suffered to infest the streets. The latter receive an alms, and are then desired to proceed. The principal trade carried on at Herrnhut is in linen; besides which the work done there by tailors, glovers, shoemakers, cabinet-makers, silversmiths, and other artificers, is well known for its good quality. They have their first prices, and never make any abatement. Every workman receives his wages; no community of goods existing among the brethren, as is falsely supposed; and the contributions towards the support of the establishment at large, the missions, and other charitable institutions, are voluntary. The building and increase of this settlement occasioned no small surprise in the adjacent country; and both in 1732, 1736, and 1737, commissioners were appointed to examine into the doctrines and proceedings of the brethren at Herrnhut. The commissioners made a favourable report; and ever since both Herrnhut and other settlements of the United Brethren in Saxony have been protected, and even several immunities offered them by the court, but not accepted. Herrnhut was visited in 1766 by the late Emperor Joseph II. after his return from Dresden, by the present king of Prussia, and by several other royal personages, who expressed their satisfaction in examining its peculiar regulations. The United Brethren have settlements in Saxony, Silesia, and other parts of Germany; in Holland, Denmark, England, Ireland, and America. In England, their principal settlements are at Fulneck near Leeds, and Fairfield near Manchester. In Greenland, North and South America, the West Indies, and Russia, they have missions for the propagation of Christianity among the heathen; and in many parts have had considerable success. See *Busching's Account of the Rise and Progress of*

Herrnhut, of the Church of the Brethren, Halle 1781; and *Herse*. *Crantz's History of the Brethren*, London 1780.

HERRNHUT (*New*), the first mission settlement of the United Brethren in the island of St Thomas in the West Indies, under Danish government, begun in 1739; their missionaries having endeavoured to propagate Christianity among the negro slaves ever since 1731, and suffered many hardships and persecutions, from which their converts were not exempted. Many of the planters finding in process of time that the Christian slaves were more tractable, moral, and industrious than the heathen, not only countenanced but encouraged their endeavours. These were also greatly facilitated by the protection of the king of Denmark, Christian VI. The settlement consists of a spacious negro church, a dwelling-house for the missionaries, negro huts, out-houses, and gardens. From this place the islands of St Croix and St Jan were at first supplied with missionaries; and the Brethren have now two settlements in each. The negro converts belonging to their church amount in those three islands to near 8000 souls.

HERRNHUT (*New*), is also the name of the oldest mission settlement of the United Brethren in Greenland. It is situated on Balls River, a few miles from the sea, near Davis's Straights, on the western coast of Greenland, not far from the Danish colony Godhaab. The two first missionaries were sent from Herrnhut in the year 1733, and their laudable intentions favoured by Christian VI. king of Denmark. They had to struggle in this uncultivated, frozen, and savage country, with inconceivable hardships, and found at first great difficulty in acquiring the language of the natives. However, after six years labour and perseverance, they had the satisfaction to baptize four persons, all of one family; and from that time the mission began to prosper, so that in the succeeding years two other settlements were begun, called Lichtenfels and Lichtenau: All of them continue in prosperity. About 1300 of the natives have been christianized since the beginning of this mission. See *Crantz's History of Greenland*, London, 1777.

HERSE, in fortification, a lattice, or porcullis, in form of an harrow, beset with iron spikes. The word *herse* is French, and literally signifies "harrow;" being formed of the Latin *herpex* or *irpex*, which denotes the same. It is usually hung by a rope fastened to a moulinet; to be cut, in case of surprise, or when the first gate is broken with a petard, that the herse may fall, and stop up the passage of the gate or other entrance of a fortress.

The herse is otherwise called a *sarrafin*, or *cataraft*; and when it consists of straight stakes, without any cross-pieces, it is called *orgues*.

HERSE, is also a harrow, which the besieged, for want of chevaux de frise, lay in the way, or in breaches, with the points up, to incommode the march as well of the horse as of the infantry.

HERSILLON, in the military art, a sort of plank or beam, ten or twelve feet long, whose two sides are drove full of spikes or nails, to incommode the march of the infantry or cavalry. The word is a diminutive of *herse*; the herfillon doing the office of a little herse. See *HERSE*.

HERTFORD. See *HARTFORD*.

HERTHA, or *HERTHUS*, in mythology, a deity

worshipped by the ancient Germans. This is mentioned by Tacitus, in his book *De Moribus Germanorum*, cap. 40. Vossius conjectures, that this goddess was Cybele: but she was more probably Terra or the Earth; because the Germans still use the word *herf* for the earth, whence also the English *earth*.

HERTZBERG, a considerable town of Germany, in the electorate of Saxony, and on the confines of Lusatia. E. Long. 13. 37. N. Lat. 51. 42.

HERVEY (James), a late divine of exemplary piety, was born in 1714, and succeeded his father in the livings of Weston Favell and Collingtree in Northamptonshire. These being within five miles of each other, he attended alternately with his curate; till being confined by his ill health, he resided constantly at Weston; where he diligently pursued the labours of the ministry and his study, under the disadvantage of a weak constitution. He was remarkably charitable; and desired to die just even with the world, and to be, as he termed it, his own executor. This excellent divine died on Christmas-day 1758, leaving the little he possessed to buy warm cloathing for the poor in that severe season.—No work is more generally or deservedly known than his *Meditations and Contemplations*; containing, Meditations among the Tombs, Reflections on a Flower-garden, a Descant on Creation, Contemplations on the Night and Starry Heavens, and a Winter-piece. The sublime sentiments in these pieces have the peculiar advantage of being conveyed in a flowing elegant language, and they have accordingly gone thro' many editions. He published besides, *Remarks on Lord Bolingbroke's Letters on History*; *Theron and Aspasio*, or a Series of Dialogues and Letters on the most important subjects; some sermons, and other tracts.

HERVEY Island, one of the South-Sea islands discovered by Captain Cook, September 23. 1773, who gave it that name in honour of the earl of Bristol. It is a low island, situated in W. Long. 158. 54. S. Lat. 19. 8.

HESBON, *ESEBON*, or *Hesebon* (anc. geog.), the royal city of the Amorites, in the tribe of Reuben, according to Moses: Though in Joshua xxi. 39. where it is reckoned among the Levitical cities, it is put in the tribe of Gad; which argues its situation to be on the confines of both.

HESIOD, a very ancient Greek poet; but whether cotemporary with Homer, or a little older or younger than him, is not yet agreed among the learned; nor is there light enough in antiquity to settle the matter exactly. His father, as he tells us in his *Opera et Dies*, was an inhabitant of Cuma, one of the Eolian isles, now called *Taio Nova*; and removed from thence to Ascra, a little village of Bœotia, at the foot of mount Helicon, where Hesiod was probably born, and called, as he often is, *Ascreus*, from it. Of what quality his father was, is nowhere said; but that he was driven by his misfortunes from Cumæ to Ascra, Hesiod himself informs us. His father seems to have prospered better at Ascra than he did in his own country; yet Hesiod could arrive at no higher fortune than keeping sheep on the top of mount Helicon. Here the muses met with him, and entered him into their service:

Erewhile as they the shepherd swain behold,
Feeding beneath the sacred mount his fold,
With love of charming song his breast they fir'd,
There met the heav'nly muses first inspir'd;
There, when the maids of Jove the silence broke,
To Hesiod thus, the shepherd swain they spoke, &c.

Hersillon

||
Hesiod.

Hesiod To this account, which is to be found in the beginning of his *Generatio Deorum*, Ovid alludes in these two lines:

Hesperides

*Nec mihi sunt visa Clio, Clisusque sorores,
Servanti pecudes vallibus Aspera tuis.*

Nor Clio nor her sisters have I seen,
As Hesiod saw them in the Ascrean green.

On the death of the father, an estate was left, which ought to have been equally divided between the two brothers Hesiod and Perses; but Perses defrauded him in the division, by corrupting the judges. Hesiod was so far from resenting this injustice, that he expresses a concern for those mistaken mortals who place their happiness in riches only, even at the expence of their virtue. He lets us know, that he was not only above want, but capable of assisting his brother in time of need; which he often did though he had been so ill used by him. The last circumstance he mentions relating to himself is his conquest in a poetical contention. Archidamus, king of Eubœa, had instituted funeral games in honour of his own memory, which his sons afterwards took care to have performed. Here Hesiod was a competitor for the prize in poetry; and won a tripod, which he consecrated to the muses. Hesiod having entered himself in the service of the muses, left off the pastoral life, and applied himself to the study of arts and learning. When he was grown old, for it is agreed by all that he lived to a very great age, he removed to Locris, a town about the same distance from mount Parnassus as Ascrea was from Helicon. His death was tragical. The man with whom he lived at Locris, a Milesian born, ravished a maid in the same house; and though Hesiod was entirely ignorant of the fact, yet being maliciously accused to her brothers as an accomplice, he was injuriously slain with the ravisher, and thrown into the sea. The *Theogony*, and *Works and Days*, are the only undoubted pieces of this poet now extant: though it is supposed that these poems have not descended perfect and finished to the present time. A good edition of Hesiod's works was published by Mr Le Clerc at Amsterdam in 1701.

HESPER, HESPERUS, in astronomy, the evening star; an appellation given to Venus when she follows or sets after the sun. The word is formed of the Greek *Εσπερος*; and is supposed to have been originally the proper name of a man, brother of Atlas, and father of the Hesperides.

Diodorus, lib. iii. relates, that Hesperus having ascended to the top of mount Atlas, the better to observe and contemplate the stars, never returned more; and that hence he was fabled to have been changed into this star.

HESPERIA, an ancient name of Italy; so called by the Greeks from its western situation. *Hesperia* was also an appellation of Spain; but with the epithet *altima* (Hor.), to distinguish it from Italy, which is called *Hesperia magna* (Virg.), from its extent of empire.

HESPERI CORNU, called the *Great Bay* by the author of Hanno's Periplus; but most interpreters, following Mela, understand a promontory; some Cape Verd, others Palmas Cape: Vossius takes it to be the former, since Hanno did not proceed so far as the latter cape.

HESPERIDEÆ, in botany (from the Hesperides); *golden or precious fruit*: the name of the 19th order in Linnæus's *Fragments of a Natural Method*. See BOTANY, p. 461.

HESPERIDES, in the ancient mythology, were the daughters of Hesper or Hesperus, the brother of Atlas. According to Diodorus, Hesperus and Atlas, two brothers who possessed great riches in the western parts of Africa. Hesperus had a daughter called Hesperia, who married her uncle Atlas, and from this marriage proceeded seven daughters, called *Hesperides* from the name of their mother, and *Atlantides* from that of their father. According to the poets, the *Hesperides* were three in number, *Ægle*, *Arethusa*, and *Hesperithusa*. Hesiod, in his *Theogony*, makes them the daughters of *Nox*, Night, and seats them in the same place with the Gorgons; viz. at the extremities of the west, near mount Atlas: it is on that account he makes them the daughters of Night, because the sun sets there. The Hesperides are represented by the ancients as having the keeping of certain golden apples, on the other side the ocean. And the poets give them a dragon to watch the garden where the fruit grows: this dragon they tell us Hercules slew, and carried off the apples.—Pliny and Solinus will have the dragon to be no other than an arm of the sea, wherewith the garden was encompassed, and which defended the entrance thereof. And Varro supposes, that the golden apples were nothing but sheep. Others, with more probability, say they were oranges.

The *Gardens of the HESPERIDES* are placed by some authors at Larach, a city of Fez; by others, at Bernich a city of Barca, which tallies better with the fable. Others take the province of Susa in Morocco for the island wherein the garden was seated. And, lastly, Rudbecks places the Fortunate Islands, and the gardens of the Hesperides, in his own country Sweden.

HESPERIDUM INSULÆ (anc. geog.), islands near the Hesperic Cornu; but the accounts of them are so much involved in fable, that nothing certain can be affirmed of them.

HESPERIS, ROCKET, *Dame's Violet*, or *queen's gilliflower*: A genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliquosa*. The petals are turned obliquely; there is a glandule within the shorter stamina; the siliqua almost upright; the stigma forked at the base, connivent, or closing at the top; the calyx close.

Species 1. The *matronalis*, or common sweet scented garden rocket, hath fibrous roots, crowned with a tuft of long, spear-shaped, rough leaves; upright, single, hairy stalks, two feet high; garnished with oval lanceolate, slightly indented, close-sitting leaves; and the stalk and branches terminated by large and long spikes of sweet-scented flowers of different colours and properties in the varieties, of which there are a great number. All the varieties of this species are so remarkable for imparting a fragrant odour, that the ladies were fond of having them in their apartments. Hence they derived the name of *dame's violet*; and, bearing some resemblance to a stock-gilliflower, were sometimes also called *queen's gilliflower*; but are now most commonly called *rocket*. *2.* The *inodora*, or scentless rocket, hath a fibrous root; upright, round, firm stalks, two feet high, garnished with spear-shaped, acute-pointed, sharply indented, close-sitting, leaves; and all the branches terminated by large spikes of scentless flowers, with obtuse petals, of different colours and properties in the varieties. This species makes

Hesperus, makes a fine appearance, but hath no scent. 3. The **Hesse**, tristis, or dull-flowered night-smelling rocket, hath fibrous roots; upright, branching, spreading, bristly stalks, two feet high; spear-shaped pointed leaves; and spikes of pale purple flowers, of great fragrance in the evening.

Culture. All the species are hardy, especially the first and second, which prosper in any of the open borders, and any common garden-soil; but the third, being rather impatient of a severe frost, and of much moisture in winter, should have a dry warm situation, and a few may be placed in pots to be sheltered in case of inclement weather. They may be propagated either by seeds, by offsets, or by cuttings off the stalks.

HESPERUS, in fabulous history, son of Cephalus by Aurora, as fair as Venus, was changed into a star, called *Lucifer* in the morning, and *Hesperus* in the evening. See **HESPER**.

HESSE, a country of Germany, in the circle of the Upper Rhine; bounded on the south by the bishoprick of Fulda; on the east by the principality of Hersfeld, Thuringia, and Eichsfeld, as also by that of Calenburg; on the north by the bishoprick of Paderborn and Waldek, the duchy of Westphalia, and the county of Witgenstein; and on the west, by Nassau-Dillenburg, the county of Solins, and Upper-Isenburg. In the above limits, the county of Katzenelnbogen and some other territories are not included. The whole country, in its utmost length, is near 100 miles, and in some places near as much in breadth. The air is cold, but wholesome; and the soil fruitful in corn, wine, wood, and pasture. The country abounds also in cattle, fish, and game; salt springs, baths, and mineral waters. The hills, which are many, yield silver, copper, lead, iron, alum, vitriol, pit-coal, sulphur, boles, a porcelain earth, marble, and alabaster. In the Eder, gold is sometimes found; and at Frankenberg a gold mine was formerly wrought. Besides many lesser streams, Hesse is watered by the following rivers, viz. the Lhan, the Fulda, the Eder or Schwalm, the Werra or Weser, and Diemel. The Rhine also and the Mayne pass through the country of Katzenelnbogen. This country, like most others in Germany, has its states, consisting of the *prelates*, as they are called, the nobility, and the towns. The diets are divided into general and particular, and the latter into the greater and smaller committees. The house of Hesse is divided into two principal branches, viz. Cassel and Darmstadt, of which Philippsdale, Rhinfeldts, and Homburg, are collateral branches; the two first of Hesse-Cassel, and the last of Hesse-Darmstadt. Their rights and privileges are very considerable. In particular, they have several votes at the diets of the empire; and causes, not exceeding 1000 florins, are determined by the courts of the country, without appeal. The princes of Hesse-Cassel are not of age till they are 25, but those of Hesse-Darmstadt are so at 18. The right of primogeniture hath been established in both houses. The revenues of Darmstadt are said to amount to near 100,000 l. a-year, and those of Hesse-Cassel to near 200,000 l. The small county of Schaumburg alone yields a revenue of 10,000 l. and that of Katzenelnbogen, with the forests of Richardswalde, it is said, was farmed near 200 years ago at 12,000 l. The prince of Hesse-Cassel has 40 or 50,000 men in

VOL. VIII. Part II.

his dominions fit to bear arms; and the troops that he hires out have often brought him in large sums, especially from Great Britain. He keeps a standing army of 15,000 men. This family is allied to most if not all of the Protestant princes in Europe. The branches of Cassel, Homburg, and Philippsdale, are Calvinists; that of Darmstadt, Lutherans; and that of Rhinfeldts, Roman Catholics. The present prince of Hesse-Cassel, indeed, in the year 1749, embraced the Roman Catholic religion; but in 1754 drew up, and confirmed by oath, an instrument, of which all the Protestant princes are guarantees, declaring that the established religion of his dominions should continue in every respect as before, and that his children should be brought up and instructed therein. Here, as in the other Protestant Lutheran countries of Germany, are consistories, superintendants, and inspectors of the church. In the whole langraviate are three universities, besides Latin schools and gymnasia, for the education of youth. The manufactures of Hesse are linen cloth, hats, stockings, gloves, paper, goldsmiths wares; and at Cassel a beautiful porcelain is made. They have also the finest wool in Germany; but are reproached with want of industry, in exporting instead of manufacturing it themselves.—This is supposed to have been the country of the ancient Catti, mentioned by Tacitus, &c. who, in after-ages, were called *Chatti*, *Chaffi*, *Haffi*, and *Hessi*. The two chief branches of Cassel and Darmstadt have many rights and privileges in common, which we have not room to specify. Both of them have a seat and vote in the college of princes at the diet of the empire, and those of this circle. Each of these princes, besides their guards and militia, maintains a considerable body both of horse and foot.

HESSIAN FLY, a very mischievous insect which lately made its appearance in North America; and whose depredations threaten in time to destroy the crops of wheat in that country entirely. It is, in its perfect state, a small winged insect; but the mischief it does is while in the form of a caterpillar; and the difficulty of destroying it is increased by its being as yet unknown where it deposits its eggs, to be hatched before the first appearance of the caterpillars. These mischievous insects begin their depredations in autumn, as soon as the wheat begins to shoot up through the ground. They devour the tender leaf and stem with great voracity, and continue to do so till stopped by the frost; but no sooner is this obstacle removed by the warmth of the spring, but the fly appears again, laying its eggs now, as has been supposed, upon the stems of the wheat just beginning to spire. The caterpillars, hatched from these eggs, perforate the stems of the remaining plants at the joints, and lodge themselves in the hollow within the corn, which shows no sign of disease till the ears begin to turn heavy. The stems then break; and being no longer able to perform their office in supporting and supplying the ears with nourishment, the corn perishes about the time that it goes into a milky state. These insects attack also rye, barley, and timothy-grass, though they seem to prefer wheat. The destruction occasioned by them is described in the American Museum (a magazine published at Philadelphia) for February 1787, in the following words: "It is well known that all the crops of wheat in all the land over which it has extended,

3 P have

Hesse,
Hessian
Fly.

Hessian
Fly.

have fallen before it, and that the farmers beyond it dread its approach; the prospect is, that unless means are discovered to prevent its progress, the whole continent will be over-run;—a calamity more to be dreaded than the ravages of war.”

This terrible insect appeared first in Long Island during the American war, and was supposed to have been brought from Germany by the Hessians; whence it had the name of the *Hessian fly*. From thence it has proceeded inland at the rate of about 15 or 20 miles annually; and by the year 1789 had reached 200 miles from the place where it was first observed. At that time it continued to proceed with unabating increase; being apparently stopped neither by rivers nor mountains. In the fly state it is likewise exceedingly troublesome; by getting into houses in swarms, falling into victuals and drink; filling the windows, and flying perpetually into the candles. It still continued to infest Long Island as much as ever; and in many places the culture of wheat was entirely abandoned.

The American States are likewise infested with another mischievous insect, named the *Virginian-wheat-fly*. This, however, has not yet passed the river Delaware; though there is danger of its being gradually inured to colder climates so as to extend its depredations to the northern colonies also. But it is by no means the same with the Hessian fly. The wheat-fly is the same with that whose ravages in the Angumois in France are recorded by M. du Hamel; it eats the grain, and is a moth in its perfect state. On the other hand, the Hessian fly has hitherto been unknown to naturalists; it eats only the leaf and stalk; and, in its perfect state, is probably a tenthredo, like the black negro-fly of the turnip.

As of late years great quantities of wheat were imported from America into Britain, it became an object worthy of the attention of government to consider how far it was proper to allow of such importation, lest this destructive insect might be brought along with the grain. The matter, therefore, was fully canvassed before the privy council; and the following is the substance of the information relative to it; and in consequence of this, the importation of American wheat was forbid by proclamation.

1. By a letter, dated 22d April 1788, Mr Bond, consul at Philadelphia, informed the marquis of Caermarthen, that there was a design to export wheat from thence to England; that the fly had made great depredations; and that there might be danger of its thus being conveyed across the Atlantic. He added, that it was not known where the eggs of the insect were deposited, though it was supposed to be in the grain. Steeping the seed in elder juice he recommended as an effectual remedy and preservative of the crop.

2. In consequence of this information his Lordship wrote to Sir Joseph Banks, president of the royal society, desiring him to inquire as much as possible concerning the insect, both with regard to its natural history, and the method of preventing its ravages. In this research, however, that learned gentleman mistook the insect called the *flying weevil* for the *Hessian fly*. Of this insect he gives a description*; but in a little time, being sensible of his mistake, he observed to the council, that his report to the marquis of Caermarthen applied not to the Hessian fly, but to a differ-

ent insect, viz. the *flying weevil*; that the danger of importing this insect was much greater than that of the Hessian fly. The corn already brought from America, he was of opinion, might easily be examined, and a discovery made whether the fly had been there. Among other methods which might be used for this purpose, that of putting the corn among water was one, when the infected grains would rise to the top, and might then be opened and examined. Some slight trials of that kind he had already made; and found manifest signs of the fly in some grains which he had opened.

3. A farther account of the insect was given by Dr Mitchel, in consequence of the above mentioned letter from the marquis of Caermarthen. According to him it was first discovered in the year 1776, on Staten Island, and the west-end of Long Island; since that time it proceeded regularly through the southern district of the state of New York, part of Connecticut; and at the time of giving the account, July 1788, had got into New Jersey. As it appeared about the time that the Hessian troops arrived, an opinion had gone abroad that they brought it along with them; but the Doctor was of opinion that it is a native animal, nourished by some indigenous plant, but which then, for the first time, came among the wheat, and found it proper food. He had seen the caterpillar, chrysalis, and fly, but never could find the egg, or discover where it is deposited. The caterpillar appears, as has already been said, in autumn, and, after having devoured the tender stalk, soon becomes a chrysalis, coloured like a flax-seed; which, being fixed between the leaf and the stalk, injures the plant by its mechanical pressure: from this proceeds the fly, which is either able of itself to sustain the intense winter frosts, or lays eggs capable of doing it. Early in the spring the caterpillar appears again, even when the heat is scarce sufficient to make the wheat grow; its ravages, therefore, are at this period particularly destructive; and it passes through its metamorphoses with such speed, as to produce a third generation while the wheat is yet tender and juicy: however, as the corn has by this time grown considerably, the third generation is not so destructive as the second. It hurts chiefly by rendering the straw weak, and liable to break down when loaded afterwards by the weight of a full ear; “and sometimes (says the Doctor) it will be infested by the fourth swarm before harvest.”

4. In another communication of Sir Joseph Banks, dated July 24. 1788, he makes some general observations on the nature of those caterpillars from which flying insects proceed; and to which class both the flying weevil and Hessian fly belong. Nature, he observes, has provided against the kinds of danger these tender insects are most likely to meet with. Thus, in climates where the winters are severe, the eggs of the most tender insects resist the force of the usual frost; in seasons of remarkable severity, indeed, some are destroyed; but a sufficient number always escape for propagating the species. The young caterpillar, if hatched before its proper food be ready, will survive even weeks before it perishes for want of nourishment; and in some few instances where it is hatched in the autumn, it is directed by instinct to spin a web, in which it remains torpid and without food during the whole winter.

Hessian
Fly.

winter. The chrysalis, though deprived of loco-motion, is capable of resisting various dangers, arising from cold, heat, wet, &c. and the length of time which the animal remains in that state is capable of very considerable extension. The complete animal, tender as it appears, and intended to exist no longer than is necessary to fulfil the business of propagation, which, in some species, is gone through in a few days, nevertheless is capable, in some instances, of enduring the utmost variation of climate; and if, by accidental circumstances, the sexes are prevented from meeting, its short life is extended to many times the amount of its usual duration.

The observations on the fly made by Sir Joseph in this paper, are not different from those already related; only he dissents from the opinion of Mr Bond, that the eggs are laid on the grain; thinking it more probable from analogy, that they are deposited on the straw; and being shaken off from thence by the strokes of the flail in threshing, are mixed with the corn; from whence it must be very difficult to separate them. Hence he concluded, that there was an apparent and very great risk of importing the eggs along with the corn; and there was no doubt, that when once they had got a footing, they would establish themselves in Britain as well as in America. It must be observed, however, that none of the grain which was examined showed any signs of this fly, its eggs, or caterpillars; such insects as were found in some diseased specimens being only the weevils common in England as well as in other countries; though some which were inspected in the month of August this year contained the chrysalis of some insects, which Sir Joseph Banks was of opinion might be the flying weevil; and as he did not know whether these would revive or not, he gave it as his opinion, that the cargo in which they were found ought not to be suffered to come into the kingdom.

5. In order to procure all the intelligence that could be had concerning these insects, the duke of Dorset addressed a letter to the royal society of agriculture in France, to know whether any of them exist in that country. The report of the society was accompanied with a drawing of two insects; one of which was supposed to be the caterpillar of the Hessian fly, from its attacking the wheat only when in the herb; beginning its ravages in autumn, reappearing in the spring, and undergoing the metamorphoses already mentioned. "That insect (say the society) whose havoc has been well known in America only since 1776, does not appear to differ from it, as well as we can judge from a very short description of those which have been observed in the north, and of which the history is contained in the different volumes of the academy of sciences of Stockholm. We know that there exist in France caterpillars whose manner of living resembles that of those insects; but the mischief which they do to corn having never been considerable enough to attract the attention of government, and not having been ourselves engaged in following in detail the history of that species of caterpillar, we regret not being able to say any thing particular upon that subject." The rest of the report contains an account of the flying weevil.

6. Further recourse was now had to America for information. The marquis of Caermarthen wrote to Sir John Temple at New York, the British consul ge-

neral; and this gentleman applied to colonel Morgan, who had been more curious with respect to this insect than any other person with whom he was acquainted. His account was, that the Hessian fly was first introduced into America by means of some straw made use of in package, or otherwise landed on Long Island at an early period of the late war; and its first appearance was in the neighbourhood of Sir William Howe's debarkation, and at Flat Bush. From thence it spread in every direction, but at first very slowly; and it was not till the year 1786 that they reached Mr Morgan's farm, situated not quite 50 miles from New York. No damage was done the first season, and very little the second; but in 1788 they were materially damaged, and in some places totally destroyed all round. "The name of *Hessian fly* (says Mr Morgan) was given to this insect by myself and a friend early after its first appearance on Long Island." In a letter to General Washington, dated July 31st 1788, Mr Morgan treats particularly of the insect itself, and mentions several experiments made by himself to oppose its depredations. The result of these was, that good culture of strong soil, or well manured lands, may sometimes produce a crop of wheat or barley, when that sowed on poor or middling soil, without the other advantages, will be totally destroyed. "But (says he) as the insect lives in its aurelia state in straw and litter through the winter, I find that unmixed barnyard manure spread on the land in the spring multiplies the fly to an astonishing degree; hence the farmer will see the necessity of mixing his yard with earth and marle in heaps; adding, where he can do it, a quantity of lime, and changing the heaps, after they have undergone the necessary fermentation, that their parts may be well incorporated, and a new digestion brought on, which will effectually destroy the insect. Rolling of wheat just before the first frosts in autumn, and soon after the last in spring, or before the wheat begins to pipe or spindle, has also a good effect. In the first place, it is a part of good culture; and, secondly, the roller crushes and destroys a great proportion of the insect. Top-dressings of lime, or of live ashes, are useful as manures, and may (when applied about the times I have mentioned as proper for rolling) be offensive to the insect; but if used in sufficient quantity to destroy them, would, I believe, destroy the wheat also. In the year 1782, a particular species of wheat was introduced on Long Island, which is found to resist the fly, and to yield a crop when all other wheats in the same neighbourhood are destroyed by it. But as this wheat has been incautiously sowed in fields with other kinds, it has generally become so mixed by the farmers, as to suffer in its character in proportion to this mixture; insomuch, that some farmers, from inattention to this circumstance, have condemned it altogether. Fortunately, however, some crops have been preserved from this degeneration; and I was so lucky as to procure the whole of my last year's seed of the purest kind; the consequence of which has been a good crop, whilst my neighbours fields, sowed with other kinds of wheat, have been either totally destroyed or materially injured. I have satisfied myself that this species of wheat was brought to New York in 1782; that a cargo of it was then sent to Messrs Underhill's mill to be manufactured into flour; and that, from seed saved out

Hessian
Fly.

Hessian
Fly.

of this parcel, the yellow-bearded wheat was propagated. It is a generally received opinion, that the capacity of the yellow-bearded wheat to resist the attacks of the fly is owing to the hardness or solidity of the straw; but when we reflect that other wheats are sometimes wholly cut off in the fall of the year, and sometimes early in the spring, before the season of its running to straw, we shall be induced to assign some other cause. I cannot point out more than two distinctions of this from other wheats. The first is in the ear, at or after harvest. The obvious difference, then, is in the colour of the chaff. The second can only be observed by the miller, who says, 'this grain requires to be more aired and dried than any other wheat before grinding, or it will not yield its flower so kindly, as it is of a more oily nature; but when thus aired and dried, the quality and quantity of its flour is equal to that of the best white wheat.'

7. In a letter from Mr Wadsworth, dated 22d August 1788, we are informed, that the experiments made with elder juice, recommended as a preventative of this evil by Mr Bond, were fallacious, and had failed in every instance in 1787; but the efficacy of the yellow bearded wheat in resisting the attacks of the fly is confirmed. The progress of the fly northward is likewise confirmed; but we are told that it has disappeared in many places near New York, where it formerly abounded.

8. In consequence of the correspondence between the marquis of Caermarthen and Mr Bond, the latter made very particular inquiry concerning this mischievous insect, and has given a better account of it than any of the above. "The Hessian fly (says he) is a small dark fly, with thin, long, black legs; clear transparent wings, extending far beyond the body of the trunk; with small, though perceptible, horns or feelers projecting from the snout. These I have seen appear in size and shape like a little fly which attacks cheese in this country, and which is very closely watched by the keepers of dairies here, as productive of the worm or skippers which destroy cheese; and it is remarkable, that the worm produced from the egg of the Hessian fly, though rather thinner and longer, bears a strong resemblance to the worm in cheese. The horns which evidently appear on the Hessian fly may be provided by nature as feelers to enable them to perforate hard grain, as well as grain in a softer state; tho' I have not yet seen any person who has perceived the egg, worm, or fly in the grain of the wheat, or who has found any nit, mucus, or even dust in the dry straw, in ricks or barns, to induce a belief that the egg is there deposited after the harvest. One publication, signed a Landholder, goes so far as to favour the idea that the fly even perforates the seed, and deposits its eggs therein. His ideas have been condemned, as tending to mislead others; but by no means confuted either by reason or experiment. An observation I made myself, gave me some cause to apprehend that the idea mentioned in the paper signed a Landholder was founded in fact: Upon examining a barn, in a country wherein the fly had not been known to injure the harvest (though it has now certainly made its appearance there within a few weeks), I observed in the flaws and apertures where the wood was decayed, over which cobwebs were woven, several of these flies entangled

in the webs, many of them dead, but some alive, and struggling to disengage themselves; from hence I concluded that there was a propensity in the fly to get into the mow; but whether with a purpose of mere shelter and nurture, or with a view to deposit its eggs, I am at a loss to decide."

9. Mr Bond now refers to some observations by a Mr Potts and Mr Cleaver, which, with several other papers on the subject, he had inclosed in his letter to the marquis. The former was a farmer in the county of Chester, who stacked his wheat in autumn 1788, at a time when the fly had not been seen in or near that county. About six or seven weeks after the harvest he had occasion to thresh some of his wheat; and with a view to prevent its scattering and wasting, he threw the sheaves from the rick upon a large sheet. On taking up the sheaves to carry them to the threshing-floor, he perceived a great number of flies, answering precisely the description of the Hessian fly, lying upon the sheet, some dead, and others in a torpid state; from whence he concluded that the fly had got a footing in his rick; but from any examination either of the straw or grain, no trace of the eggs being deposited was discovered. Mr Cleaver, a farmer in the same county, apprehending that the fly might approach his neighbourhood, sowed some wheat in his garden, which grew so as to appear above ground in less than a fortnight, when a violent north-east wind came on; and, immediately after he perceived small clouds of flies over and about the wheat he had sown. He examined the grain in a few days; and found that numbers of the flies had deposited their eggs in the heart of the main stalk, and many of them lay dead on the ground where the wheat was sown, and near it. Many of the eggs were found in the stalk; and some small white worms produced from other eggs were lately discovered in the stalk very near the root of the wheat. Wherever these worms were found, the whole of the individual stalk was perceptibly changed in point of colour, tending to a yellowish cast; the top hanging down quite shrunk and withered. In some of the wheat which was carefully examined, the eggs were found within the stalk of a very minute size and whitish colour, with something of a yellow tinge. In those where the worm was formed, it was carefully wrapped up, surrounded by different coats of the shoot in which it lay, as if it had been skilfully and tenderly rolled up for its preservation; around it the stalk was plainly eaten away, some nearly through. The worm strongly resembles the skipper in cheese, somewhat thinner, and rather longer, of a whitish cast. The ground on which this wheat was sown was rich garden ground, high and dry; the natural soil a strong red clay; few of the shoots, of which there were many in one cluster in proportion to their number, were hurt by the fly. This was imputed to the strength of the soil, which producing a robust powerful growth, resisted, in a great degree, the attack of the fly, though the weak shoots suffered generally.

10. A similar account of the Hessian fly is given by Mr Jacobs, an experienced farmer in the county of Montgomery. From his observations the egg is usually deposited in the funnel or sheath a little above the first joint. When the eggs are laid in the autumn or spring,

Hessian
Fly.

Hessian
Fly.Hessian
Fly.

spring, they are utterly destructive of the growth of the wheat; but when they are deposited shortly before the harvest, the grain or even the stalk is scarcely affected, especially in rich ground. The egg, he says, is at first very minute; it grows rapidly, becomes full and large, and turns to a brown hue, in size and colour very like a flax seed. A material difference was also perceived between rich and poor ground with respect to the ravages of the fly; but none between moist and dry soils. He is also of opinion that the yellow-bearded wheat will resist the attacks of the fly; and that rolling and feeding the wheat will be of great service.

11. A farmer in Jersey, who dates his letter from Hunterdon, Jan. 30. 1787, observes, that though the fly is supposed to advance about 15 miles annually, and neither waters nor mountains obstruct its passage; yet when disturbed, he never saw them take a flight of above five or six feet; nevertheless they are so active, that it is very difficult to catch them. They first appear towards the end of September; and soon after their eggs appear hatched, in colour and size like a flax seed: they are very low at the joints; some even in the ground; and here they harbour all winter. On their first appearance in any district, their numbers being small they seldom cut off the crop in this state, which is often the case the second or third year. In the spring, after warm weather, they again appear as a small worm, and destroy the crop. The remedies proposed by this farmer are, sowing upon rich ground elder, and rolling. A gentleman whose account was dated on the first of November 1786, says, that their eggs resemble what is commonly called the *fly-blow* on meat, being very small, and only one in a place. Soon after, the other blades of wheat proceeding from the same kernel inclose the first, the egg is covered, and agreeable to the usual progress of insects arrives at the state of a worm, and descends towards the root, where it consumes the tender blade, sometimes destroying the whole crop in the fall; but if, by reason of the fertility of the soil, and other concurrent circumstances, the vegetation is so rapid as to baffle their efforts, some of the latter-laid eggs, when at the worm state, entrench themselves in the ground to the depth of an inch or more, where he had found them after severe frosts changed from a white to a greenish colour, and almost transparent; from this they proceed to the aurelia state, and thus continue probably in the ground till the spring, when the fly is again produced, which again lays its eggs, and finishes the work begun in the fall, to the total destruction of the crop. Another piece of intelligence he gives, but not from his own observation, that by feeding the wheat very close in the winter and spring, if the land is rich, it will again spring up, and the worms do not much injure the second growth. By another correspondent we are informed, that maritime places are less liable to be infested with the fly than the interior parts of the country; and therefore recommends as an experiment, that fine salt should be sprinkled on the wheat just before, or very soon after, the appearance of the fly. By others, elder has been much recommended, as well as rolling, ^dc. though the bearded wheat already mentioned ¹ seems to be the only effectual remedy.

12. By another communication from Mr Morgan

to the Philadelphia Society for promoting agriculture, he informs us, that he had made himself acquainted with the fly by breeding a number of them from the chrysalis into the perfect state. The fly is at first of a white body with long black legs and whiskers, so small and motionless as not to be easily perceived by the naked eye, though very discernible with a microscope; but they soon become black and very nimble, both on the wing and feet, being about the size of a small ant. During the height of the brood in June, where 50 or 100 of the nits have been deposited on one stalk of wheat, he has sometimes discovered, even with the naked eye, some of them to twist and move on being disturbed: this is while they are white; but they do not then travel from one stalk to another, nor to different parts of the same stalk. The usual time of their spring-hatching from the chrysalis is in May. "Those (says he) who are doubtful whether the fly is in their neighbourhood, or cannot find their eggs or nits in the wheat, may satisfy themselves by opening their windows at night and burning a candle in the room. The fly will enter in proportion to their numbers abroad. The first night after the commencement of wheat harvest, this season, they filled my dining-room in such numbers as to be exceedingly troublesome in the eating and drinking vessels. Without exaggeration I may say, that a glass-tumbler from which beer had been just drank at dinner, had 500 flies in it in a few minutes. The windows are filled with them when they desire to make their escape. They are very distinguishable from every other fly by their horns or whiskers." With regard to the cure, it seems to be confirmed that the sowing of that called the *yellow-bearded wheat* can only be depended upon. The fly indeed will reside in fields of this wheat, and lay its eggs upon the stalks; but no injury was ever known to happen except in one single instance, where it was sown in a field along with the common sort, and that in a very small proportion to it. By another account, however, we are told that the yellow-bearded wheat is equally liable to be destroyed in the autumn with the common kind; so that the only method of securing the crop is by sowing it late in the season, when the fly is mostly over.

13. The utmost pains were taken by the British government to find out whether this destructive insect exists in Germany or any of the northern countries of Europe; but from the accounts received, it appears that it has not hitherto been observed, or at least if it exists, the damage done by it is too inconsiderable to attract notice.

14. From the whole correspondence on this subject, which from the abridgement just now given of it is evidently somewhat discordant, Sir Joseph Banks drew up a report for the privy council, dated March 2. 1789, in which he states the following particulars: 1. The appearance of the fly in Long Island was first observed in 1779. We must suppose this to be meant that its destructive effects became then first perceptible; for it seems undoubtedly to have been known in the year 1776. 2. The opinion of colonel Morgan, that it was imported by the Hessians, seems to be erroneous, as no such insect can be found to exist in Germany or any other part of Europe. 3. Since its first

Hessian
Fly.

first appearance in Long Island it has advanced at the rate of 15 or 20 miles a-year, and neither waters nor mountains have impeded its progress. It was seen crossing the Delaware like a cloud, from the Fall's Township to Mankfield; had reached Saratoga, 200 miles from its first appearance, infesting the counties of Middlesex, Somerset, Huntington, Morris, Sussex, the neighbourhood of Philadelphia, all the wheat counties of Connecticut, &c. committing the most dreadful ravages; attacking wheat, rye, barley, and timothy-grass. 4. The Americans who have suffered by this insect, speak of it in terms of the greatest horror. In colonel Morgan's letter to Sir John Temple, he uses the following expressions. "Were it to reach Great Britain, it would be the greatest scourge that island ever experienced; as it multiplies from heat and moisture, and the most intense frosts have no effect on the egg or aurelia. Were a single straw, containing the insect, egg, or aurelia, to be carried and safely deposited in the centre of Norfolk in England, it would multiply in a few years, so as to destroy all the wheat and barley crops of the whole kingdom. There cannot exist such an atrocious villain as to commit such an act intentionally. 5. No satisfactory account of the mode in which this insect is propagated has hitherto been obtained. Those which say that the eggs are deposited on the stalk from six or eight to 50, and by their growth compress and hinder the stalk from growing, are evidently erroneous, and the authors of them have plainly mistaken the animal itself for its eggs. It is sufficient to remember, that eggs do not grow or increase in bulk, to prove that what they observed was not eggs. 6. The landholder's opinion, that the eggs are deposited on the ripe grains of wheat, though contradicted by colonel Morgan, is not disproved, as the colonel advances no argument against it. 7. A letter dated New York, September 1. 1786, says that the eggs are deposited on the young blade, resembling what we call a *fly-blow* in meat; very small, and but one in a place: but this, though the only natural mode of accounting for the appearance of the insect, had it been true, must undoubtedly have been confirmed by numbers of observations. 8. Even though this should be found hereafter to be the case, there will still remain a danger of the aurelias being beaten off by the flail from the straw in threshing the wheat, and imported into Britain along with it; the presence of these flies in barns having been fully proved by the observations of Messrs Potts and Bond. 9. None of the remedies proposed against this destructive insect have been in any degree effectual, excepting that of sowing the yellow bearded wheat; the straw of which is sufficiently strong to resist the impression of the insect, and even if its eggs are deposited upon it receives little injury in point of produce in grain: this provides, however, no remedy for the loss of the barley crop, nor for that which must be incurred by sowing the yellow-bearded wheat on lands better suited by nature for the produce of other kinds: it appears also that this very kind is liable to degenerate, and probably from a different cause than that proposed by colonel Morgan, viz. the mixture with common wheat. 9. Though the Agricultural Society at Philadelphia, as well as colonel Morgan, have declared their opinions decisively that no danger can arise from wheat import-

ed into Britain, as the insect has no immediate connection with the grain; yet with nearly if not exactly the same materials before him which these gentlemen were furnished with, Sir Joseph Banks could not avoid drawing a conclusion directly contrary; and he concludes his report with the words of Mr Bond in a letter to the marquis of Caermarthen. "Satisfactory as it would be to my feelings to be able to say with precision, that I apprehend no danger of extending the mischief by seed, my duty urges me to declare, that I have not heard or seen any conclusive fact by which I could decide on a matter of such importance; and till that test occurs, the wisdom of guarding against so grievous a calamity is obvious."

On the 27th of April the same year, another paper, by way of appendix to the foregoing, was given in by Sir Joseph Banks. In this he again observes, that none of the descriptions of any European insect hitherto published answer exactly to the Hessian fly. In a letter from Mr Bond to the marquis of Caermarthen, he mentions another kind of insect in the state of Maryland, called by way of eminence *the fly*; and which in some things resembles the Hessian fly, though it cannot be accounted the same. It makes its way into the mow, and bites the ends of the grain perceptibly, and no doubt deposits its eggs in the grain itself; since it has been observed, that wheat recently threshed, and laid in a dry warm place, will soon be covered with an extreme clammy crust, which binds the wheat on the surface together in such a way as to admit its being lifted in lumps; but the wheat beneath will not be hurt to any considerable depth. Such is the quality of this fly, that if the hand be inserted into the heap affected by it, watery blisters are immediately raised; and the farmers and slaves, riding upon bags of this infected wheat, never fail to be severely blistered thereby. "This insect (says he) is called in Maryland the *Revolution fly*, by the friends of the British government; but from all I can learn it is not the same insect which originated on Long Island, and is called the *Hessian fly* (by way of opprobrium) by those who favoured the revolution. All the papers I have read on the Hessian fly are very inaccurate, not to say contradictory; and I am convinced it is by no means a settled point at this moment in what manner and place the eggs of these insects are deposited. The policy which induced government to open the ports being founded on an appearance of a scarcity of corn, that evil may be remedied by the admission of flour instead of grain; and tho' the countries from whence the flour is carried will have the advantage of the manufacture, still that cannot be reckoned as an object, when opposed in the scale to an evil of such immense magnitude as the introduction of so destructive an insect may occasion. The ravages here are beyond conception ruinous. Many farmers have had their crops so completely cut off as to be left without bread-corn or even seed-corn. If the measure of confining the importation to flour alone should be adopted, great attention should be paid to the quality of the flour admitted into the British ports. An infinite deal of the wheat of the last harvest is of a very wretched quality; and stratagems [will be practised to give an extensive vent to so essential a staple of the middle states of America."

Fly.

Hefychius
||
Heteroge-
neity.

In another letter to the same nobleman, Mr Bond expresses himself to the following purpose. "I have not been able to collect any decided information which fixes the essential point, how far the insect may be communicated by seed. It is a matter at this time quite undecided here: nor have I heard or observed any very conclusive reason to suppose that the fly makes its way generally into barns and ricks. A very intelligent farmer in the county of Bucks, informed me that it was the prevailing opinion there, and so I found it, that the fly did not either in the field or in the mow affect the grain of the wheat: a neighbour of his, in threshing the little wheat he had saved last harvest, observed the fly rise from the straw in great numbers wherever it was struck by the flail; but though it was at first presumed that the fly had insinuated itself into the mow for the purpose of depositing its eggs in the grain or in the straw, no trace of the egg could be discovered from the appearance of any mucus or dust, either in the grain or in the straw; hence it was inferred that all the mischief was done in the field."

HESYCHIUS, the most celebrated of all the ancient Greek grammarians whose works are now extant, was a Christian; and, according to some, the same with Hefychius patriarch of Jerusalem, who died in 609. He wrote a Greek lexicon; which, in the opinion of Casaubon, is the most learned and useful work of that kind produced by the ancients. Schrevelius published a good edition of it in 1668, in 4to, with notes; but the best is that of John Alberti, printed at Leyden in 1746, in two vols folio.

HETERIARCH, HÆTERIARCHA, in antiquity, an officer in the Greek empire, whereof there were two species; the one called simply *beteriarch*, and the other *great beteriarch*, who had the direction of the former.

The word is Greek, *ταγμαρχα*, formed of the Greek *ταγμα* *socius*, "companion, ally," and *αρχη* *imperium*, "command." Their principal function was to command the troops of the allies; besides which, they had some other duties in the emperor's court, described by Codin. *De Officiis*, cap. 5. n. 30, 31, 32, 37.

HETEROCLITE, HETEROCLITON, in grammar, an irregular or anomalous word, which either in declension, conjugation, or regimen, deviates from the ordinary rules of grammar. The word is Greek, *ετεροκλιτος*; formed of *ετερος* *alter*, "another, different," and *κλιω*, "I decline."

Heteroclite is more peculiarly applied to nouns which vary or are irregular in point of declension; having fewer cases, numbers, &c. than ordinary; or that are of one declension in one number, and another in another: as, *Hoc vas, vasis; hæc vasa, vasorum*.

HETERODOX, in polemical theology, something that is contrary to the faith or doctrine established in the true church. The word is formed of the Greek *ετεροδοξος*; a compound of *ετερος* "alter," and *δοξα* "opinion." Thus, we say a *beterodox* opinion, a *beterodox* divine, &c. The word stands in opposition to *orthodox*.

HETEROGENEITY, in physics, the quality or disposition which denominates a thing *heterogeneous*. The word is also used for the heterogeneous parts

themselves; in which sense, the heterogeneities of a body are the same thing with the impurities thereof.

HETEROGENEOUS, or HETEROGENEAL, literally imports something of a different nature, or that consists of parts of different or dissimilar kinds; in opposition to *homogeneous*. The word is Greek; formed of *ετερος* *alter*, "different," and *γενος* *genus*, "kind;" *q. d.* composed of different kinds of parts.

HETEROGENEOUS Light, is by Sir Isaac Newton said to be that which consists of rays of different degrees of refrangibility. Thus the common light of the sun or clouds is heterogeneous, being a mixture of all sorts of rays.

HETEROGENEOUS Nouns, one of the three variations in irregular nouns; or such as are of one gender in the singular number, and of another in the plural.—Heterogeneous, under which are comprehended mixed nouns, are six-fold. 1. Those which are of the masculine gender in the singular number, and neuter in the plural; as, *hic tartarus, hæc tartara*. 2. Those which are masculine in the singular number, but masculine and neuter in the plural; as, *hic locus, hi loci & hæc loca*. 3. Such as are feminine in the singular number, but neuter in the plural; as, *hæc carbasus, & hæc carbasæ*. 4. Such nouns as are neuter in the singular number, but masculine in the plural; as, *hoc calum, hi celi*. 5. Such as are neuter in the singular, but neuter and masculine in the plural; as, *hoc rastrum, hi rastri, & hæc rastra*. And, 6. Such as are neuter in the singular, but feminine in the plural number; as, *hoc epulum, hæc epulæ*.

HETEROGENEOUS Quantities, are those which are of such different kind and consideration, as that one of them, taken any number of times, never equals or exceeds the other.

HETEROGENEOUS Surds, are such as have different radical signs; as, $\sqrt{aa}$, and $\sqrt[3]{bb}$; $\sqrt[5]{9}$, and $\sqrt[7]{19}$.

HETEROSCI, in geography, a term of relation, denoting such inhabitants of the earth as have their shadows falling but one way, as those who live between the tropics and polar circles; whose shadows at noon in north latitude are always to the northward, and in south latitude to the southward.

HETH, the father of the Hittites, was the eldest son of Canaan (Gen. x. 15.), and dwelt southward of the promised land, at Hebron or thereabouts. Ephron, an inhabitant of Hebron, was of the race of Heth, and this whole city in Abraham's time was peopled by the children of Heth. There are some who maintain that there was a city called Heth, but we find no footsteps of it in the scripture.

HETRURIA, and ETRURIA, a celebrated country of Italy, at the west of the Tyber. It originally contained 12 different nations, which had each their respective monarch. Their names were Veientes, Clusini, Perusini, Cortonenses, Arretini, Vetuloni, Volaterrani, Rusellani, Volscinii, Tarquinii, Falisci, and Cæretani. The inhabitants were particularly famous for their superstition and strict confidence in omens, dreams, auguries, &c. They all proved powerful and resolute enemies to the rising empire of the Romans, and were conquered only after much effusion of blood.

HEVÆI (anc. geog.), one of the seven people who occupied Canaan; a principal and numerous people, and the same with the *Kadmonai*, dwelling at the foot of Hermon

Heteroge-
neous
||
Hevæi.

Heuchera
||
Heusden.

Hermion and partly of Libanus, or between Libanus and Hermon (Judges iii. 3.) To this Bachart refers the fables concerning Cadmus and his wife Harmonia, or Hermonia, changed to serpents; the name *Hevi* denoting a wild beast, such as is a serpent. Cadmus, who is said to have carried the use of letters to Greece, seems to have been a Kadmonean; of whom the Greeks say that he came to their country from Phœnicia.

HEUCHERA, in botany; a genus of the digynia order, belonging to the pentandria class of plants. There are five petals; the capsule is birostrated and bilocular.

HEVELIUS, or HEVELKE, (John), an eminent astronomer, was born at Dantzic in 1611. He studied in Germany, England, and France, and every where obtained the esteem of the learned. He was the first that discovered a kind of libration in the moon, and made several important observations on the other planets. He also discovered several fixed stars, which he named the *firmament of Sobieski*, in honour of John III. king of Poland. His wife was also well skilled in astronomy, and made a part of the observations published by her husband. In 1673 he published a description of the instruments with which he made his observations, under the title of *Machina Cœlestis*; and in 1679 he published the second part of this work; but in September the same year, while he was at a seat in the country, he had the misfortune to have his house at Dantzic burnt down. By this calamity he is said to have sustained a loss of several thousand pounds; having not only his observatory and all his valuable instruments and apparatus destroyed, but also a great number of copies of his *Machina Cœlestis*; which accident has made this second part very scarce, and consequently very dear. In the year 1690 were published *Firmamentum Sobiescianum*, and *Prodromus astronomicæ & novæ tabulæ solares, una cum catalogo fixarum*, in which he lays down the necessary preliminaries for taking an exact catalogue of the stars. But both these works are posthumous; for Hevelius died in 1687, on his birth-day, aged 76. He was a man greatly esteemed by his countrymen, not only on account of his great reputation and skill in astronomy, but as a very excellent and worthy magistrate. He was made a burgo-master of Dantzic; which office he is said to have executed with the utmost integrity and applause. He was also very highly esteemed by foreigners; and not only by those skilled in astronomy and the sciences, but by foreign princes and potentates: as appears abundantly from a collection of their letters which were printed at Dantzic in the year 1683.

HEURNIUS, or VAN HEURN, (John), a learned physician, was born at Utrecht in 1543; and studied at Louvain, Paris, Padua, and Pavia. At his return to his native country he became magistrate of Amsterdam; after which he was professor of physic at Leyden, and rector of the university of that city, where he died in 1601. He wrote, among other works, several treatises on the diseases of different parts of the body, and several commentaries on the works of Hippocrates.—*Otho Heurnius* his son was also professor of physic at Leyden, and wrote some books.

HEUSDEN, a strong town of the United Provinces, in Holland, seated on the river Maese, among N^o 153.

marshes, with a handsome castle, in E. Long. 5. 3. N. Lat. 51. 47. Hewson

HEWSON (William), a very ingenious anatomist, was born in 1739. He became assistant to Dr Hunter, and was afterwards in partnership with him; but, on their disagreement, read anatomical lectures at his own house (in which he was seconded by Mr Falconer). He wrote *Inquiries into the Properties of the Blood*, and the *Lymphatic System*, 2 vols; and disputed with Dr Monro the discovery of the lymphatic system of vessels in oviparous animals. He died in 1774.

HEXACHORD, in ancient music, a concord called by the moderns a *sixth*.

HEXAGON, in geometry, a figure of six sides and angles; and if these sides and angles are equal, it is called a *regular hexagon*.

HEXAHEDRON, in geometry, one of the five platonic bodies, or regular solids, being the same with a cube.

HEXAMETER, in ancient poetry, a kind of verse consisting of six feet; the first four of which may be indifferently either spondees or dactyles; the fifth is generally a dactyl and the sixth always a spondee. Such is the following verse of Horace:

1 2 3 4 5 6
Aut pro|desse vo|lunt, aut| dele|clare po|ete.

HEXAMILION, HEXAMILI, or *Hexamilium*, a celebrated wall, built by the emperor Emanuel in 1413 over the isthmus of Corinth. It took its name from *ἕξ* *fix*, and *μῖλον*, which in the vulgar Greek signifies a *mile*, as being six miles long.

The design of the hexamilion was to defend Peloponnesus from the incursions of the barbarians. Amurath II. having raised the siege of Constantinople in the year 1424, demolished the hexamilium, though he had before concluded a peace with the Greek emperor. The Venetians restored it in the year 1463, by 30,000 workmen, employed for 15 days, and covered by an army commanded by Bertoldo d'Este general of the land forces, and Louis Loredano commander of the sea.—The infidels made several attempts upon it; but were repulsed, and obliged to retire from the neighbourhood thereof: but Bertoldo being killed at the siege of Corinth, which was attempted soon after, Bertino Calcinato, who took on him the command of the army, abandoned, upon the approach of the beglerbeg, both the siege and the defence of the wall which had cost them so dear; upon which it was finally demolished.

HEXANDRIA, in botany, (from *ἕξ* *fix*, and *ἄνδρ* *a man*); the name of the sixth class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which are furnished with six stamina or male organs, that are of an equal length. See BOTANY, p. 430.

HEXAPLA (formed of *ἕξ* *fix*, and *ἄπλω* *I open, I unfold*), in church-history, a Bible disposed in six columns; containing the text, and divers versions thereof, compiled and published by Origen, with a view of securing the sacred text from future corruptions, and to correct those that had been already introduced.

Eusebius, Hist. Eccl. lib. vi. cap. 16. relates, that Origen, after his return from Rome under Caracalla, applied himself to learn Hebrew, and began to collect the several versions that had been made of the sacred writings,

Hewson
||
Hexapla.

Hexapla. writings, and of these to compose his Tetrapla and Hexapla; others, however, will not allow him to have begun till the time of Alexander, after he had retired into Palestine, about the year 231.

To conceive what this Hexapla was, it must be observed, that, besides the translation of the sacred writings, called the Septuagint, made under Ptolemy Philadelphus, above 280 years before Christ, the Scripture had been since translated into Greek by other interpreters. The first of those versions, or (reckoning the Septuagint) the second, was that of Aquila, a proselyte Jew, the first edition of which he published in the 12th year of the emperor Adrian, or about the year of Christ 128; the third was that of Symmachus, published, as is commonly supposed, under Marcus Aurelius, but, as some say, under Septimius Severus, about the year 200; the fourth was that of Theodotion, prior to that of Symmachus, under Commodus, or about the year 175. These Greek versions, says Dr Kennicott, were made by the Jews from their corrupted copies of the Hebrew, and were designed to stand in the place of the Seventy, against which they were prejudiced, because it seemed to favour the Christians. The fifth was found at Jericho, in the reign of Caracalla, about the year 217; and the sixth was discovered at Nicopolis, in the reign of Alexander Severus, about the year 228: lastly, Origen himself recovered part of a seventh, containing only the Psalms.

Now Origen, who had held frequent disputations with the Jews in Egypt and Palestine, observing that they always objected against those passages of Scripture quoted against them, and appealed to the Hebrew text; the better to vindicate those passages, and confound the Jews by showing that the Seventy had given the sense of the Hebrew, or rather to show by a number of different versions what the real sense of the Hebrew was, undertook to reduce all these several versions into a body along with the Hebrew text, so as they might be easily confronted, and afford a mutual light to each other.

He made the Hebrew text his standard; and allowing that corruptions might have happened, and that the old Hebrew copies might and did read differently, he contented himself with marking such words or sentences as were not in his Hebrew text, nor the later Greek versions, and adding such words or sentences as were omitted in the Seventy, prefixing an asterisk to the additions, and an obelisk to the others.

In order to this, he made choice of eight columns: in the first he gave the Hebrew text in Hebrew characters; in the second the same text in Greek characters; the rest were filled with the several versions above-mentioned; all the columns answering verse for verse, and phrase for phrase; and in the Psalms there was a ninth column for the seventh version.

This work Origen called *Ἑξαπλά Hexapla*, q. d. *sex-tuple*, or work of six columns, as only regarding the first six Greek versions. See **TETRAPLA**.

Indeed, St Epiphanius, taking in likewise the two columns of the text, calls the work *Ὀκτάπλα*, as consisting of eight columns.

This celebrated work, which Montfaucon imagines consisted of fifty large volumes, perished long ago, probably with the library at Cæsarea, where it was preserved, in the year 653; though several of the ancient writers have preserved us pieces thereof: parti-

cularly St Chrysostom on the Psalms, Philoponus in his Hexameron, &c. Some modern writers have earnestly endeavoured to collect fragments of the Hexapla, particularly Flaminius Nobilius, Drusius, and F. Montfaucon, in two folio volumes, printed at Paris in 1713.

HEXASTYLE, in architecture, a building with six columns in front.

HEXHAM, a town of Northumberland, situated near the conflux of the north and south Tyne. It is commonly reckoned to be the *Alexodunum* of the Romans, where the first cohort of the Spaniards were in garrison. It was made a bishop's see by Etheldreda, wife of king Egfred, in the year 675. Its first bishop St Wilfred built here a most magnificent cathedral and monastery, and it was possessed by seven bishops successively; but being very much infested by the Danes, the see was removed to York. The town and priory were destroyed by the Scots in 1296, and pillaged again in 1346. There was a remarkable and bloody battle fought near this town between the houses of Lancaster and York, wherein the former were defeated, chiefly by the extraordinary bravery and conduct of John Nevil, lord Montacute, who was for that reason created earl of Northumberland. The present town is not populous, and the streets are narrow, with ill-built houses. The market-place, near the centre of the town, is a spacious square, it is supplied by a fountain with water. Among the remains of ancient structures is a gateway of Saxon architecture, leading to the priory, but of a much older date. There are two ancient towers in the town, one of which is used as a sessions-house, and was formerly an exploratory tower; the other is on the top of a hill towards the Tyne, of remarkable architecture, which has been much higher than at present, and has two dungeons within it, besides several chambers with very little narrow windows. The town has a charity or grammar school. It was in 1571 annexed to the county of Cumberland: but only in civil matters; for its ecclesiastical jurisdiction is not the same with the rest of the county, it being still a peculiar belonging to the archbishop of York; and the vulgar still call the neighbouring country Hexhamshire. It is a corporation governed by a bailiff chosen yearly. Newcastle is about 15 miles distance. The markets here are Tuesday and Saturday; fairs on August 5. and November 8. A rivulet, called Hexbold, runs by the town, which sometimes overflows suddenly.

HEYDON, a little, pleasant, well-built town of Yorkshire, in that part called *Holderness*, seated on a river that falls into the Humber. It has now but one church, tho' there are the remains of two more; and had formerly a considerable trade, which is now lost, on account of its being so near Hull. The houses being rebuilt, adds to the beauty of the place. It is a corporation; and is governed by a mayor, a recorder, nine aldermen, and two bailiffs, who have the power of choosing sheriffs, and are justices of the peace. It sends two members to parliament. W. Long. o. 55. N. Lat. 53. 46.

HEYDON (John), who sometimes assumed the name of *Eugenius Theodidactus*, was a great pretender to skill in the Rosicrucian philosophy and the celestial signs, in the reign of king Charles I.; and wrote a considerable number of chemical and astrological works, with

Hexastyle
||
Heydon.

Heylin,
Heywood.

very singular titles. This ridiculous author was much resorted to by the duke of Buckingham, who was infatuated with judicial astrology. He employed him to calculate the king's and his own nativity, and was assured that his stars had promised him great things. The duke also employed Heydon in some treasonable and seditious practices, for which he was sent to the Tower. He lost much of his former reputation by telling Richard Cromwell and Thurloe, who went to him disguised like cavaliers, that Oliver would infallibly be hanged by a certain time; which he out-lived several years.

HEYLIN (Dr Peter), an eminent English writer, was born at Burford, in Oxfordshire, in 1600. He studied at Hart Hall, Oxford; where he took his degrees in arts and divinity, and became an able geographer and historian. He was appointed one of the chaplains in ordinary to King Charles I. was presented to the rectory of Hemingford in Huntingdonshire, made a prebendary of Westminster, and obtained several other livings: but of these he was deprived by the parliament, who also sequestered his estate; by which means he and his family were reduced to great necessity. However, upon the restoration, he was restored to his spiritualities; but never rose higher than to be subdean of Westminster. He died in 1662; and was interred in St Peter's church in Westminster, where he had a neat monument erected to his memory. His writings are very numerous: the principal of which are, 1. *Microcosmus*, or a Description of the Great World. 2. *Cosmographia*. 3. The History of St George. 4. *Ecclesia Vindicata*, or the Church of England Justified. 5. Historical and Miscellaneous Tracts, &c.

HEYWOOD (John), one of our most ancient dramatic poets, was born at North-Mims, near St Alban's in Hertfordshire, and educated at Oxford. From thence he retired to the place of his nativity; where he had the good fortune to become acquainted with Sir Thomas More, who, it seems, had a seat in that neighbourhood. This patron of genius introduced our comic poet to the princess Mary, and afterwards to her father Henry, who, we are told, was much delighted with his wit and skill in music, and by whom he was frequently rewarded. When his former patroness, queen Mary, came to the crown, Heywood became a favourite at court, and continued often to entertain her majesty, *exercising his fancy before her, even to the time that she lay languishing on her deathbed*. On the accession of Elizabeth, being a zealous Papist, he thought fit to decamp, with other favourites of her deceased majesty. He settled at Mechlin in Flanders, where he died in the year 1565.—John Heywood was a man of no great learning, nor were his poetical talents by any means extraordinary; but he possessed talents of more importance in the times in which he lived, namely, the talents of a jester. He wrote several plays; 500 epigrams; *A Dialogue in Verse concerning English Proverbs*; and *The Spider and Fly, a Parable*, a thick 4to. Before the title of this last work is a whole-length wooden print of the author; who is also represented at the head of every chapter in the book, of which there are 77.—He left two sons, who both became Jesuits and eminent men: *viz.* Ellis Heywood, who continued some time at Florence under the patronage of cardinal Pole, and became so good a

master of the Italian tongue, as to write a treatise in that language, intitled *Il Moro*; he died at Louvain about the year 1572. His other son was Jasper Heywood, who was obliged to resign a fellowship at Oxford on account of his immoralities: he translated three tragedies of Seneca, and wrote various poems and devises; some of which were printed in a volume intitled *The Paradise of Dainty Devises*, 4to, 1573. He died at Naples in 1597.

HEYWOOD (Eliza), one of the most voluminous novel writers this island ever produced; of whom we know no more than that her father was a tradesman, and that she was born about the year 1696. In the early part of her life, her pen, whether to gratify her own disposition or the prevailing taste, dealt chiefly in licentious tales, and memoirs of personal scandal: the celebrated Atalantis of Mrs Manley served her for a model; and *The Court of Carimania*, *The new Utopia*, with some other pieces of a like nature, were the copies her genius produced. She also attempted dramatic writing and performance, but did not succeed in either. Whatever it was that provoked the resentment of Pope, he gave full scope to it by distinguishing her as one of the prizes to be gained in the games introduced in honour of Dullness, in his *Dunciad*. Nevertheless, it seems undeniable, that there is much spirit, and much ingenuity, in her manner of treating subjects, which the friends of virtue may perhaps wish she had never meddled with at all. But, whatever offence she may have given to delicacy or morality in her early works, she appears to have been soon convinced of, and endeavoured to atone for, in the latter part of her life; as no author then appeared a greater advocate for virtue. Among her riper productions may be specified, *The Female Spectator*, 4 vols; *The history of Miss Betsy Thoughtless*, 4 vols; *Jemmy and Jenny Jessamy*, 3 vols; *The invisible spy*, 4 vols; with a pamphlet, intitled *A present for a servant-maid*. She died in 1759.

HIAMEN, or EMOUY. See EMOUY.

HIATUS, properly signifies an opening, chasm, or gap; but it is particularly applied to those verses where one word ends with a vowel, and the following word begins with one, and thereby occasions the mouth to be more open, and the sound to be very harsh.

The term *hiatus* is also used in speaking of manuscripts, to denote their defects, or the parts that have been lost or effaced.

HIBISCUS, SYRIAN MALLOW: A genus of the polyandria order, belonging to the monodelphia class of plants; and in the natural method ranking under the 37th order, *Columniferae*. The calyx is double, the exterior one polyphyllous, the capsule quinquelocular and polyspermous.

Species. Of this genus there are 36 species; the most remarkable are, 1. The Syriacus, commonly called *althæa frutex*, is a native of Syria. It rises with shrubby stalks to the height of eight or ten feet, sending out many woody branches covered with a smooth grey bark, garnished with oval spear-shaped leaves, whose upper parts are frequently divided into three lobes. The flowers come out from the wings of the stalk at every joint of the same year's shoot. They are large, and shaped like those of the mallow, having five large roundish petals which join at their base, spreading open at the top, in the shape of an open bell.

Heywood
Hibiscus.

Hibiscus.

Hibiscus.

bell. These appear in August; and if the season is not too warm, there will be a succession of flowers till September. The flowers are succeeded by short capsules, with five cells, filled with kidney-shaped seeds; but unless the season proves warm, they will not ripen in this country. Of this species there are four or five varieties, differing in the colour of their flowers: the most common hath pale purple flowers with dark bottoms; another hath bright purple flowers with black bottoms; a third hath white flowers with purple bottoms; and a fourth variegated flowers with dark bottoms. There are also two with variegated leaves, which are by some much esteemed. All these varieties are very ornamental in a garden. 2. The *Rosa Sinensis*, with an arborescent stem, and egg-pointed sawed leaves. It is a native of the East Indies, whence it has got the name of *China rose*; but the seeds having been carried by the French to their West India settlements, it hath thence obtained the name of *Martinico rose*. Of this there are the double and single flowering kinds; the seeds of the first frequently produce plants that have only single flowers, but the latter seldom vary to the doublekind. 3. The *mutabilis*, or changeable rose, has a soft spongy stem, which by age becomes ligneous and pithy. It rises to the height of 12 or 14 feet, sending out branches towards the top, which are hairy, garnished with heart-shaped leaves, cut into five acute angles on their borders, and slightly sawed on their edges; of a lucid green on their upper side, but pale below. The flowers are produced from the wings of the leaves; the single are composed of five petals which spread open, and are at first white, but afterwards change to a blush rose colour, and as they decay turn purple. In the West Indies, all these alterations happen on the same day, and the flowers themselves are of no longer duration; but in Britain the changes are not so sudden. The flowers are surrounded by short, thick, blunt, capsules, which are very hairy; having five cells, which contain many small kidney-shaped seeds, having a fine plume of fibrous down adhering to them. 4. The *albemoschus*, or musk-seeded hibiscus, is a native of the West Indies, where the French cultivate great quantities of it. The plant rises with an herbaceous stalk three or four feet high, sending out two or three side-branches, garnished with large leaves cut into six or seven acute angles, sawed on their edges, having long footstalks, and placed alternately. The stalks and leaves of this sort are very hairy. The flowers come out from the wings of the leaves upon pretty long footstalks which stand erect. They are large, of a sulphur colour, with purple bottoms; and are succeeded by pyramidal five-cornered capsules, which open in five cells, filled with large kidney-shaped seeds of a very musky odour. 5. The *tiliaceus*, or maho-tree, is a native of both the Indies. It rises with a woody, pithy stem, to the height of ten feet, dividing into several branches towards the top, which are covered with a woolly down, garnished with heart-shaped leaves ending in acute points. They are of a lucid green on their upper side, and hoary on the under side, full of large veins, and are placed alternately. The flowers are produced in loose spikes at the end of the branches, and are of a whitish-yellow colour. They are succeeded by short acuminate capsules, opening

in five cells, filled with kidney-shaped seeds. 6. The *trionum*, Venice mallow, or flower of an hour, is a native of some parts of Italy, and has long been cultivated in the gardens of this country. It rises with a branching stalk a foot and an half high, having many short spines, which are soft and do not appear unless closely viewed: the leaves are divided into three lobes, which are deeply jagged almost to the midrib. The flowers come out at the joints of the stalks, upon pretty long foot-stalks. They have a double empalement; the outer being composed of ten long narrow leaves, which join at their base: the inner is of one thin leaf swollen like a bladder, cut into five acute segments at the top, having many longitudinal purple ribs, and is hairy. Both these are permanent, and inclose the capsule after the flower is past. The flower is composed of five obtuse petals, which spread open at the top; the lower part forming an open bell-shaped flower. These have dark purple bottoms, but are of a pale sulphur-colour above. In hot weather the flowers continue but a few hours open; however, there is a succession of flowers that open daily for a considerable time. 7. The *esculentus*, or eatable hibiscus, rises to five or six feet; has broad five-parted leaves, and yellow large flowers. The pod or okra is from two to six inches long, and one inch diameter. When ripe, it opens longitudinally in five different places, and discharges a number of heart-shaped seeds.

Culture. The first sort may be propagated either by seeds or cuttings. The seeds may be sown in pots filled with light earth about the latter end of March, and the young plants transplanted about the same time next year. They will succeed in the full ground; but must be covered in winter whilst young, otherwise they are apt to be destroyed. The second, third, fifth, and seventh sorts are propagated by seeds, which must be sown in a hot-bed. The young plants are to be transplanted into small separate pots, and treated like other tender vegetables, only allowing them a good share of air. The fourth sort is annual in this country, though biennial in those places where it is native. It is propagated by seeds, and must be treated in the manner directed for Amaranth. The sixth sort is propagated by seeds, which should be sown where the plants are designed to remain, for they do not bear transplanting well. They require no other culture than to be kept free from weeds, and thinned where they are too close; and if the seeds are permitted to scatter, the plants will come up fully as well as if they had been sown.

Uses. The fourth sort is cultivated in the West Indies by the French for the sake of its seeds. These are annually sent to France in great quantities, and form a considerable branch of trade, but the purposes which they answer are not certainly known. The inner rind of the fifth sort is very strong, and of great esteem, which the following recital from Dampier may serve to illustrate: They (the Musketo Indians) make their lines, both for fishing and striking, with the bark of Maho, which is a sort of tree or shrub that grows plentifully all over the West Indies, and whose bark is made up of strings or threads very strong; you may draw it off either in flakes or small threads, as you have occasion.—It is fit for any manner of cordage, and pri-

vateers

Hicetas
||
Hidalgo.

vateers often make their rigging of it. See further the article BARK.

The seventh sort is a native of the West Indies, where it is cultivated in gardens and inclosures as an article of food.—The whole of it is mucilaginous, especially the pods. “These (Dr Wright informs us) are gathered green, cut into pieces, dried, and sent home as presents, or are boiled in broths or soups for food. It is the chief ingredient in the celebrated pepper-pot of the West Indies, which is no other than a rich olla: the other articles are either flesh meat, or dried fish and capicum. This dish is very palatable and nourishing.—As a medicine okra is employed in all cases where emollients and lubricants are indicated.”

HICETAS of Syracuse, an ancient philosopher and astronomer, who taught that the sun and stars were motionless, and that the earth moved round them. This is mentioned by Cicero, and probably gave the first hint of the true system to Copernicus. He flourished 344 B. C.

HICKES (George), an English divine of extraordinary parts and learning, born in 1642. In 1681 he was made king's chaplain, and two years after dean of Worcester. The death of Charles II. stopped his farther preferment; for though his church principles were very high, he manifested too much zeal against Popery to be any favourite with James II. On the revolution, he with many others was deprived for refusing to take the oaths to king William and queen Mary; and soon after, archbishop Sancroft and his colleagues considering how to maintain episcopal succession among those who adhered to them, Dr Hickes carried over a list of the deprived clergy to king James; and with his sanction a private consecration was performed, at which it is said lord Clarendon was present. Among others, Dr Hickes was consecrated suffragan bishop of Thetford, and died in 1715.—He wrote, 1. *Institutiones Grammaticæ Anglo-Saxonicæ, et Mæso-Gothicæ.* 2. *Antiqua literatura septentrionalis.* 3. Two treatises, one of the Christian priesthood, the other of the dignity of the episcopal order. 4. Jovian, or an answer to Julian the apostate. 5. Sermons; with many temporary controversial pieces on politics and religion.

HICKCUP, or HICCUGH, a spasmodic affection of the stomach, œsophagus, and muscles subservient to deglutition, arising sometimes from some particular injury done to the stomach, œsophagus, diaphragm, &c. and sometimes from a general affection of the nervous system. See (the *Index* subjoined to) MEDICINE.

HIDAGE (*Hidagium*), was an extraordinary tax payable to the kings of England for every hide of land. This taxation was levied not only in money, but in provision, armour, &c.; and when the Danes landed in Sandwich in 994, king Ethelred taxed all his lands by hides; so that every 310 hides found one ship furnished, and every eight hides furnished one jack and one saddle, to arm for the defence of the kingdom, &c.—Sometimes the word *bidage* was used for the being quit of that tax: which was also called *hidegild*; and interpreted, from the Saxon, “a price or ransom paid to save one's skin or hide from beating.”

HIDALGO, in modern history, a title given in Spain to all who are of noble family.

The Hidalgos claim a descent from those valiant sol-

diers who retired into Castile, and the mountains of Asturias, and other remote parts of Spain, on the invasion of the Moors, where having fortified themselves, they successively descended into the plains, in proportion to the success of their arms: from the notoriety of their persons, or the lands they became possessed of, they acquired the appellation of *Hidalgos notorios*, *Hidalgos de solar conocido*, or *de casa solariega*. Of these, according to Hernando Mexia, there are three sorts; the first being lords of places, villages, towns, or castles, from whence they took their surnames, as the Guzmans, Mendozas, Laras, Guivaras, and others; the second, who recovered any fortresses from the Moors, as the Ponces of Leon, and others; and the third sort, from the places where they resided, or held jurisdiction, as Rodrigo de Narvaez was called of Antequera, from being Alcayde there. But this definition is not considered as exact or conclusive by Otalora, another civilian, who says that the true meaning of *Hidalgos de solar conocido* is explained by the laws of Castile to be a well known mansion or possession, the nature of which is particularly explained in the laws of *Parditas*, lib. 5. tit. 35. which describe three sorts of tenures called *Devifa*, *Solariega*, and *Behetria*. By the first, lands are devised by the ancestor; *solar* is a tenure upon another person's manor, and obliges the owner to receive the lord of the fee when necessity obliges him to travel; and *Behetria* is in the nature of an *allodium*. In proportion as these Aborigines gained ground on the Moors, and increased in their numbers, many private persons distinguished themselves by their valour, and obtained testimonies of their services, called *cartas de merced*, which served them as a foundation of their birth and good descent, without which documents their posterity could not make it appear; and if from a lapse of time, or other unavoidable accidents, such proof should happen to be lost or destroyed, the law affords them a remedy under these circumstances, by a declaration, importing, that such persons as are supposed to have had such certificates, may be relieved by making it appear that their ancestors, time immemorial, have always been held and reputed as Hidalgos, and enjoyed the privileges of such, from a strong presumption in their favour; the possession of land having equal force to any other document; which is fully set forth in the *Pragmatica* of Cordova. To these executory letters are granted, *cartas executorias*, expressive of their privileges; and for the better regulation of these matters, proper officers are appointed in the chancery courts, called *alcaldes de los hidalgos*, who ought to be *hidalgos* themselves, and hold jurisdiction in these cases, and no others: but even here innovations have taken place; for as these grants flow from the sovereign, who is the fountain of honour, some are declared *Hidalgos de sangre*, by right of descent, and others *de privilegio*, or by office, in which the will of the sovereign has made amends for any deficiency of blood.

There is a set of people near Segovia, at a place called Zamarramala, who are exempt from tribute on account of the care they take in sending proper persons every night to the castle of Segovia to keep centinel—one cries out *Vela, vela, ha*, and the other blows a horn, from whence they have been titled *hidalgos by the horn*. In Catalonia those gentlemen who

Hidalgo. are styled *Hombre de Pareja*, are considered the same as *hidalgos* in Castile, and were so called from the word *parejar*, to equip, this name being given as a distinction by Borelo the 4th count of Barcelona, at the siege of that city, in 965, who summoning all his vassals to come to his assistance against the Moors, nine hundred horsemen well mounted and equipped joined him, and with their aid he took the city; and this appellation has been given in honourable remembrance of this loyal action.

These noble hidalgos enjoy many privileges and distinctions; of which the following are the principal.

1. The first and greatest privilege which they hold by law is to enjoy all posts of dignity and honour in the church and state, with liberty, when churchmen, of having a plurality of benefices. They are qualified for receiving all orders of knighthood, and are to be preferred in all embassies, governments, and public commissions.

2. When they are examined as witnesses in civil and criminal cases, their depositions are to be taken in their own houses, without being obliged to quit them to go to those of others.

3. In all churches, processions, and other public acts or assemblies, they are to have the next place of honour and precedence after the officers of justice, conforming themselves to particular customs.

4. They are not obliged to accept of any challenge for combat, supposing such were allowed of, but from those who are their equals.

5. Though it is forbidden to guardians to purchase the estates of minors, this does not extend to *Hidalgos*, in whom the law does not suppose any fraud, and they may purchase them publicly.

6. They are permitted to be seated in courts of justice in presence of the judges, from the respect and honour due to them. They have also seats in the courts of chancery, in consideration of their birth, which gives them a right to be near the persons of princes.

7. Their persons are free from arrest for debt, nor can any attachment be laid on their dwelling-houses, furniture, apparel, arms, horses, or mules in immediate use: nor can they make a cession of their estates, nor be distressed in suits of law, farther than their circumstances will admit of, but are to be allowed a reasonable and decent maintenance for their support.

8. In cases of imprisonment for criminal matters, they are to be treated differently from others. They are generally confined to their own houses with a safe guard, or under arrest upon their honour, or allowed the city or town they lived in, and in particular cases are sent into castles.

9. When punishments are inflicted for criminal cases, they are to be less severe to them than to others, as they are not to suffer ignominious punishments, such as public shame, whipping, galleys, nor are they to be hanged, but beheaded, excepting in cases of treason or heresy. In cases that do not imply a corporal punishment but a pecuniary one, they are treated with more rigour, and pay a larger fine than others.

10. They are not to be put to the rack or torture, excepting for such heinous crimes as are particularly specified by the laws.

11. When there are title-deeds or other writings or papers in which two or more persons have an equal right or property, and require a particular charge, they are to be given up by preference to the custody of an *Hidalgo*, if any of the parties are such.

12. The daughter of an *Hidalgo* enjoys every privilege of her birth, though married to a commoner; and a woman who is not an *Hidalgo* enjoys all these privileges when she is a widow, following the fortune of her husband.—But if the widow is an *Hidalgo*, and the late husband was a commoner, she falls into the state of her husband after his death, though she had the privileges of her birth during his life.

13. They are free from all duties, called *Pechos*, *Pedidos*, *Monedas*, *Martenegas*, *Contribuciones*, as well royal as civil, and all other levies of whatever kind they may be, with a reserve for such as are for the public benefit, in which they are equally concerned, such as the repairing the highways, bridges, fountains, walls, destruction of locusts, and other vermin.

14. They are free from personal service, and from going to the wars, excepting when the king attends in person; even then they are not to be forced, but invited, and acquainted that the royal standard is displayed.

15. No persons whatever can be quartered upon, or lodged in their houses, except when the king, queen, prince or infant are on the road, as in such cases even the houses of the clergy are not exempt.

16. They cannot be compelled to accept of the office of receiver of the king's rents, or any other employment which is considered as mean and derogatory to their dignity and rank.

17. By a particular custom confirmed by royal authority in that part of Castile beyond the Ebro, bastards succeed to their parents, and enjoy their honours contrary to the royal and common law.

18. If a lady, who marries a commoner, should be a queen, duchess, marchioness, or countess (for they have no barons in Castile), she not only does not lose her rank, but conveys her titles to her husband, who holds them in right of his wife.

These are the general privileges which the *Hidalgos* enjoy; there are some others of less consequence, as well as particular grants to certain persons and families. An ancient and ridiculous custom is said to be observed by noble ladies who are widows of plebeians, in order to recover their birthright, for which purpose they carry a pack-saddle on their shoulders to their husband's grave, then throwing it down and striking it three times, say, 'Villein, take thy villeiny, for I will abide by my nobility:' and then they recover their privileges again.

HIDE, the skin of beasts; but the word is particularly applied to those of large cattle, as bullocks, cows, horses, &c.

Hides are either raw or green, just as taken off the carcase; salted, or seasoned with salt, alum, and saltpetre, to prevent their spoiling; or curried and tanned. See **TANNING**.

HIDE of Land, was such a quantity of land as might be ploughed with one plough within the compass of a year, or as much as would maintain a family; some call it 60, some 80, and others 100 acres.

HIDE Bound. See **FARRIERY**, §. xxiii.

HIERACIUM.

Hidalgo,
Hide.

Hieracium
Hierapolis.

HIERACIUM, HAWKWEED: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked, the calyx imbricated and ovate; the pappus simple and sessile.

Species. 1. The aurantiacum, commonly called *grim the collier*, hath many oblong oval entire leaves, crowning the root; an upright, single, hairy, and almost leafless stalk, a foot high, terminated by reddish orange-coloured flowers in a corymbus. These flowers have dark oval ash-coloured calices; whence the name of *grim the collier*. 2. The pilosella or mouse-ear, hath blossoms red on the out-side, and pale yellow within; the cups set thick with black hairs. The flowers open at eight in the morning, and close about two in the afternoon. 3. The umbellatum grows to the height of three feet, with an erect and firm stalk, terminated with an umbel of yellow flowers.

Culture. The first is the only species cultivated in gardens. It is propagated by seeds, or parting the roots. The seed may be sown in autumn or spring. In June, when the plants are grown two or three inches high, they may be picked out and planted in beds, where they must remain till the next autumn, and then transplanted where they are to remain.

Properties. The second species is commonly in dry pastures in England; it has a milky juice, but is less bitter and astringent than is usual with plants of that class. It is reckoned hurtful to sheep. An insect of the cochineal genus (*Coccus Polonicus*) is often found at the roots, (*Ad. Upsal. 1752.*) Goats eat it; sheep are not fond of it; horses and swine refuse it.—The third species is a native of Scotland, and grows in rough stony places, but is not very common. The flowers are sometimes used for dying yarn of a fine yellow colour.

HIERACITES, in church-history, Christian heretics in the third century: so called from their leader Hierax, a philosopher of Egypt; who taught that Melchisedek was the Holy Ghost, denied the resurrection, and condemned marriage.

HIERANOSIS, or **MORBUS SACER**. See (the *Index* subjoined to) **MEDICINE**.

HIERA PICRA. See **PHARMACY**, n° 826.

HIERAPOLIS, (anc. geog.), a town of Phrygia, abounding in hot springs; and having its name from the number of its temples. There are coins exhibiting figures of various gods who had temples here. Of this place was Epictetus the stoic philosopher.—It is now called *Pambouk*; and is situated near the Scamander, on a portion of Mount Mefogis, distant six miles from Laodicea.—Its site appears at a distance as a white lofty cliff; and upon arriving at it, the view which it presents is so marvellous (says Dr Chandler), that the description of it, to bear even a faint resemblance, ought to appear romantic. Dr Chandler's description is as follows:

*Travels in
Asia Minor,
p. 229.*

“The vast slope which at a distance we had taken for chalk, was now beheld with wonder, it seeming an immense frozen cascade, the surface wavy, as of water at once fixed, or in its headlong course suddenly petrified. Round about us were many high, bare, stony ridges; and close by our tent, one with a wide basis, and a slender rill of water, clear, soft, and warm, running in a

small channel on the top. A woman was washing linen in it, with a child at her back; and beyond were cabins of the Turcomans, standing distinct, much neater than any we had seen, each with poultry feeding, and a fence of reeds in front.

“It is an old observation, that the country about the Mæander, the soil being light and friable, and full of salts generating inflammable matter, was undermined by fire and water. Hence it abounded in hot springs, which, after passing under-ground from the reservoirs, appeared on the mountain, or were found bubbling up in the plain or in the mud of the river: and hence it was subject to frequent earthquakes; the nitrous vapour compressed in the cavities, and sublimed by heat or fermentation, bursting its prison with loud explosions, agitating the atmosphere, and shaking the earth and waters with a violence as extensive as destructive; and hence, moreover, the pestilential grottos, which had subterraneous communications with each other, derived their noisome effluvia; and serving as smaller vents to these furnaces or hollows, were regarded as apertures of hell, as passages for deadly fumes rising up from the realms of Pluto. One or more of the mountains perhaps has burned. It may be suspected, that the surface of the country has in some places been formed from its own bowels; and in particular, it seems probable, that the hill of Laodicea was originally an eruption.

“The hot waters of Hierapolis have produced that most extraordinary phenomenon, the cliff, which is one entire incrustation. They were anciently renowned for this species of transformation. It is related, they changed so easily, that being conducted about the vineyards and gardens, the channels became long fences, each a single stone. They produced the ridges by our tent. The road up to the ruins, which appears as a wide and high causeway, is a petrification; and overlooks many green spots, once vineyards and gardens, separated by partitions of the same material. The surface of the flat, above the cliff, is rough with stone and with channels, branching out in various directions, a large pool overflowing and feeding the numerous rills, some of which spread over the slope as they descend, and give to the white stony bed a humid look, resembling salt or driven snow when melting. This crust, which has no taste or smell, being an alkaline, will ferment with acids; and Picecini relates, that trial of it had been made with spirit of vitriol. The waters, though hot, were used in agriculture.

“Tamerlane, when he invaded this country, encamped for the summer at Tangûzlik, where many of his men were destroyed by drinking of a spring which stagnated and petrified. The Turkish name Pambouk signifies *cotton*; and, it has been said, refers to the whiteness of the incrustation.

“The shepherd-poet of Smyrna, after mentioning a cave in Phrygia sacred to the Nymphs, relates, that there Luna had once descended from the sky to Endymion, while he was sleeping by his herds; that marks of their bed were then extant under the oaks; and that in the thickets around it the milk of cows had been spilt, which men still beheld with admiration (for such was the appearance if you saw it very far off); but that from thence flowed clear or warm water, which in a little while concreted round about the channels, and formed a stone pavement. The writer describes the cliff of Hierapolis,

Hierapolis. Hierapolis, if I mistake not, as in his time; and has added a local story, current when he lived. It was the genius of the people to unite fiction with truth; and, as in this and other instances, to dignify the tales of their mythology with fabulous evidence taken from the natural wonders in which their country abounded.

"We ascended in the morning to the ruins, which are on a flat, passing by sepulchres with inscriptions, and entering the city from the east. We had soon the theatre on our right hand, and the pool between us and the cliff. Opposite to it, near the margin of the cliff, is the remains of an amazing structure, once perhaps baths, or, as we conjectured, a gymnasium; the huge vaults of the roof striking horror as we rode underneath. Beyond it is the mean ruin of a modern fortress; and farther on are massive walls of edifices, several of them leaning from their perpendicular, the stones distorted, and seeming every moment ready to fall; the effects and evidences of violent and repeated earthquakes. In a recess of the mountain on the right hand is the area of a stadium. Then again sepulchres succeed, some nearly buried in the mountain-side, and one a square building, with an inscription in large letters. All these remains are plain, and of the stone created by the waters. The site has been computed about two hundred paces wide and a mile in length.

"After taking a general survey, we returned to the theatre, intending to copy inscriptions, and examine more particularly as we changed our station. We found this a very large and sumptuous structure, and the least ruined of any we had seen. Part of the front is standing. In the heap which lies in confusion, are many sculptures well executed in basso relievo; with pieces of architrave inscribed, but disjointed; or so encumbered with massive marbles, that we could collect from them no information. The character is large and bold, with ligatures. The marble seats are still unremoved. The numerous ranges are divided by a low semicircular wall, near mid-way, with inscriptions on the face of it, but mostly illegible. I copied a short but imperfect one, in which Apollo Archegetes of *The Leader* is requested to be propitious. In another compartment, mention is made of the city by its name *Hierapolis*; and on a third is an encomium in verse, which may be thus translated, "Hail, golden city Hierapolis, the spot to be preferred before any in wide Asia; revered for the rills of the Nymphs; adorned with splendor." The Nymphs presided over springs and fountains.

After attentively viewing them, and considering their height, width, and manner of arrangement, I am inclined to believe, that the ancient Asiatics sat at their plays and public spectacles like the modern, with their legs crossed or gathered under them; and it is probable upon carpets.

"The waters of Hierapolis were surprisingly attuned for tinging wool, with a colour from roots rivaling the more costly purples; and were a principal source of the riches of the place. The company of dyers is mentioned in the inscription on the square building among the sepulchres. That heron or monument was to be crowned by them with garlands or festoons of flowers. The springs flowed so copiously, that the city was full of spontaneous baths; and Apollo, the tutelar deity of the Hierapolitans, with Æsculapius and Hygiea, on their medals, bear witness to the medicinal vir-

tues which they possess. The people, in some of their inscriptions, are styled the *most splendid*, and the senate the *most powerful*.

"The pool before the theatre has been a bath, and marble fragments are visible at the bottom of the water, which is perfectly transparent, and of a briny taste.

"Hierapolis was noted, besides its hot waters, for a plutonium. This was an opening in a small brow of the adjacent mountain, capable of admitting a man, and very deep, with a square fence before it, inclosing about half an acre; which space was filled with black thick mist, so that the bottom could be scarcely discerned. The air, to those who approached it, was innocent on the outside of the fence, being clear of the mist in serene weather, it remaining then within the boundary; but there death abode. Bulls, as at Nyssa, dropt down, and were dragged forth without life; and some sparrows which Strabo let fly instantly fell senseless. But eunuchs, the priests of Magna Mater, or Cybele, could go in quite to the aperture, lean forward, or enter it unharmed; but they held their breath, as their visages testified, and sometimes until in danger of suffocation. Strabo, the relater, was in doubt whether all eunuchs could do this, or only they of the temple; and whether they were preserved by Divine Providence, as in cases of enthusiasm, or were possessed of some powerful antidotes. But it is likely this mist was the condensed steam of the hot waters, made noxious by the qualities of the soil; and that the whole secret of the priests consisted in carrying their faces high in the air, as another spectator has observed they always did; and in avoiding respiration when they stooped. I had hoped the description of this spot would have enabled me to find it, but I searched about for it unsuccessfully.

"We descended to our tent at the approach of evening, by a steep track down the cliff, beginning beyond the pool, in which we also bathed with pleasure, on the side next the gymnasium. Our way was often rough and slippery, resembling ice, and our horses with difficulty preserved their footing. When arrived at our tent, I renewed my inquiries for the plutonium; and an old Turk, with a beard as white as snow, told me he knew the place, that it was often fatal to their goats; and accounting for the effect, said, it was believed to be the habitation of a dæmon or evil spirit. We ascended again early in the morning to the theatre, where he had promised to join us; and a live fowl was intended to be the martyr of experiment." But our author was interrupted by some banditti, and obliged to leave Hierapolis in haste.

HIERARCHY, among divines, denotes the subordination of angels.

Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different names according to their different degrees of power and knowledge.

HIERARCHY, likewise denotes the subordination of the clergy, ecclesiastical polity, or the constitution and government of the Christian church considered as a society.

HIRES, the name of some small islands lying near the coast of Provence in France, opposite to the towns of Hieres and Toulon, where the English fleet lay many months in 1744, and blocked up the French and Spanish fleets in the harbour of Toulon.

HIRES,

Hierapolis
||
Hieres.

Hieres
||
Hieroglyphics.

HIERES, a town of Provence in France, seated on the Mediterranean sea. It is a pretty little town, and was formerly a colony of the Marfilians; and pilgrims used to embark here for the holy land. But its harbour being now choaked up, it is considerable only for its salt-works. E. Long. 6. 13. N. Lat. 43. 7.

HIERO I. and II. kings of Syracuse. See SYRACUSE.

HIEROCLES, a cruel persecutor of the Christians, and a violent promoter of the persecution under Dioclesian, flourished in 302. He wrote some books against the Christian religion; in which he pretends some inconsistencies in the Holy Scriptures, and compares the miracles of Apollonius Tyanæus to those of our Saviour. He was refuted by Lactantius and Eusebius. The remains of his works were collected into one volume octavo, by bishop Pearson; and published in 1654, with a learned dissertation prefixed to the work.

HIEROCLES, a Platonic philosopher of the fifth century, taught at Alexandria, and was admired for his eloquence. He wrote seven books upon Providence and Fate; and dedicated them to the philosopher Olympiodorus, who by his embassies did the Romans great services under the emperors Honorius and Theodosius the younger. But these books are lost, and we only know them by the extracts in Photius. He wrote also a Commentary upon the golden verses of Pythagoras; which is still extant, and has been several times published with those verses.

HIEROGLYPHICS, in antiquity, mystical characters, or symbols, in use among the Egyptians, and that as well in their writings as inscriptions; being the figures of various animals, the parts of human bodies, and mechanical instruments. The word is composed of the Greek *hieros* sacer, "holy," and *glyphein* sculpere, "to engrave;" it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. engraven with such figures.

Hieroglyphics are properly emblems or signs of divine, sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things.

Hermes Trismegistus is commonly esteemed the inventor of hieroglyphics: he first introduced them into the heathen theology, from whence they have been transplanted into the Jewish and Christian.

Sacred things, says Hippocrates, should only be communicated to sacred persons. Hence it was that the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and the secrets of their morality and history; and this they did by a kind of cabbala, which, at the same time that it instructed them, only amused the rest of the people. Hence the use of hieroglyphics, or mystic figures, to veil their morality, politics, &c. from profane eyes. This author, it may be observed, and many others, do not keep to the precise character of a hieroglyphic, but apply it to profane as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express, the things. Thus, according to Clemens Alexandrinus, Strom. v. a lion is the hieroglyphic of strength
N^o 153.

and fortitude; a bullock, of agriculture; a horse, of liberty; a sphinx, of subtilty, &c.

Such is the opinion that has generally been embraced, both by ancient and modern writers, of the origin and use of hieroglyphics. It has been almost uniformly maintained, that they were invented by the Egyptian priests in order to conceal their wisdom from the knowledge of the vulgar; but the late bishop Warburton hath, with much ingenuity and learning, endeavoured to show that this account is erroneous.

According to this writer, the first kind of hieroglyphics were mere pictures, because the most natural way of communicating our conceptions by marks or figures was by tracing out the images of things; and this is actually verified in the case of the Mexicans, whose only method of writing their laws and history was by this picture-writing. But the hieroglyphics invented by the Egyptians were an improvement on this rude and inconvenient essay towards writing, for they contrived to make them both pictures and characters. In order to effect this improvement, they were obliged to proceed gradually, by first making the principal circumstance of the subject stand for the whole; as in the hieroglyphics of Horapollon, which represent a battle of two armies in array by two hands, one holding a shield and the other a bow: then putting the instrument of the thing, whether real or metaphorical, for the thing itself, as an eye and sceptre to represent a monarch, a ship and pilot the governor of the universe, &c.: and finally, by making one thing stand for or represent another, where their observations of nature or traditional superstitions led them to discover or imagine any resemblance: thus, the universe was designed by a serpent in a circle, whose variegated spots denoted the stars; and a man who had nobly surmounted his misfortune was represented by the skin of the hyæna, because this was supposed to furnish an invulnerable defence in battle.

The Chinese writing, he observes, was the next kind of improvement in the use of hieroglyphics. The Egyptians joined characteristic marks to images; the Chinese threw out the images and retained only the contracted marks, and from these marks proceeded letters. The general concurrence of different people in this method of recording their thoughts can never be supposed to be the effect of imitation, sinister views, or chance; but must be considered as the uniform voice of nature speaking to the rude conceptions of mankind: for not only the Chinese of the East, the Mexicans of the West, and the Egyptians of the South, but the Scythians likewise of the North, and the intermediate inhabitants of the earth, viz. the Indians, Phœnicians, Ethiopians, &c. used the same way of writing by picture and hieroglyphic.

The bishop farther shows, that the several species of hieroglyphic writing took their rise from nature and necessity, and not from choice and artifice, by tracing at large the origin and progress of the art of speech. He proceeds to show how in process of time the Egyptian hieroglyphics came to be employed for the vehicle of mystery. They used their hieroglyphics two ways; the one more simple, by putting the part for the whole, which was the curiologic hieroglyphic; and the other more artificial, by putting one thing of resembling qualities for another, called the *tropical hieroglyphic*:
thus

Hieroglyphics.

Hieroglyphics.

thus the moon was sometimes represented by a half circle and sometimes by a cynocephalus. They employed their proper hieroglyphics to record openly and plainly their laws, policies, public morals, and history, and all kinds of civil matters: this is evident from their obelisks, which were full of hieroglyphic characters, designed to record singular events, memorable actions, and new inventions; and also from the celebrated inscription on the temple of Minerva at Sais, where an infant, an old man, a hawk, a fish, and a river-horse, expressed this moral sentence: "All you who come into the world and go out of it, know this, that the gods hate impudence." However, the tropical hieroglyphics, which were employed to divulge, gradually produced symbols which were designed to secrete or conceal: thus Egypt was sometimes expressed by the crocodile, sometimes by a burning censer with a heart upon it; where the simplicity of the first representation and the abstruseness of the latter show, that the one was a tropical hieroglyphic for communication, and the other a tropical symbol invented for secrecy.

Enigmatic symbols were afterwards formed by the assemblage of different things, or of their properties that were less known; and though they might have been intelligible at first, yet when the art of writing was invented, hieroglyphics were more generally disused, the people forgot the signification of them, and the priests, retaining and cultivating the knowledge of them because they were the repositories of their learning and history, at length applied them to the purpose of preserving the secrets of their religion.

Symbols were the true original of animal-worship in Egypt, as Sir John Marsham conjectured, *Can. Chron.* p. 58. because in these hieroglyphics was recorded the history of their greater deities, their kings, and lawgivers, represented by animals and other creatures. The symbol of each god was well known and familiar to his worshippers, by means of the popular paintings and engravings on their temples and other sacred monuments; so that the symbol presenting the idea of the god, and that idea exciting sentiments of religion, it was natural for them, in their addresses to any particular god, to turn to his representative mark or symbol; especially when we consider farther, that the Egyptian priests feigned a divine original for hieroglyphic characters, in order to increase the veneration of the people for them. These would of course bring on a relative devotion to these symbolic figures, which, when it came to be paid to the living animal, would soon terminate in an ultimate worship.

Another consequence of the sacredness of the hieroglyphic characters was, that it disposed the more superstitious to engrave them on gems, and wear them as amulets or charms. This magical abuse seems not to have been much earlier than the established worship of the god Serapis, which happened under the Ptolemies, and was first brought to the general knowledge of the world by certain Christian heretics and natives of Egypt, who had mixed a number of Pagan superstitions with their Christianity. These gems, called *abraxas*, are frequently to be met with in the cabinets of the curious, and are engraven with all kinds of hieroglyphic characters. To these *abraxas* succeed the talismans.

VOL. VIII. Part II.

HIEROGRAMMATISTS, (*Hierogrammatei*), i. e. *holy registers*, were an order of priests among the ancient Egyptians, who presided over learning and religion. They had the care of the hieroglyphics, and were the expositors of religious doctrines and opinions. They were looked upon as a kind of prophets; and it is pretended, that one of them predicted to an Egyptian king, that an Israelite (meaning Moses), eminent for his qualifications and achievements, would lessen and depress the Egyptian monarchy.—The hierogrammatei were always near the king, to assist him with their informations and counsels. The better to fit them for this, they made use of the skill and knowledge they had acquired in the stars and the motions of the heavenly lights, and even of the writings of their predecessors, wherein their functions and duties were delivered. They were exempted from all civil employments, were reputed the first persons in dignity next the king, and bore a kind of sceptre in form of a ploughshare.—After Egypt became a province of the Roman empire, the hierogrammatei sunk into neglect.

HIEROMANCY, in antiquity, that part of divination which predicted future events from observing the various things offered in sacrifice. See **DIVINATION** and **SACRIFICE**.

HIEROMNEMON, among the ancient Greeks, signified a delegate chosen by lot, and sent to the great council of the Amphictyons, where he was to take care of what concerned religion. The hieromnemonies were reckoned more honourable than the other members of that assembly, the general meetings of which were always summoned by them, and their names were prefixed to the decrees made by that council.

HIEROMNEMON (composed of *hieros* "sacred," and *mnemon* "one who advertises or puts in mind of," an officer in the ancient Greek church, whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c. and show him the prayers, psalms, &c. which he was to rehearse. He also clothed the patriarch in his pontifical robes, and assigned the places of all those who had a right to be around him when seated on his throne, as the master of the ceremonies now does to the pope.

HIERONYMUS. See **JEROME**.

HIEROPHANTES, or **HIEROPHANTA**, (from *hieros* *holy*, and *phaino* *I appear*), in antiquity, a priest among the Athenians.

The hierophantes was properly the chief person that officiated in the eleusinia, that great solemnity sacred to Ceres.

This office was first executed by Eumolpus, and continued in his family for 1200 years, though when any person was appointed to this dignity he was required alway to live in celibacy.

St Jerome says, that the hierophantes extinguished the fire of lust by drinking cicuta or the juice of hemlock, or even by making themselves eunuchs. Apollodorus observes, that it was the hierophantes who instructed persons initiated into their religion in the mysteries and duties thereof, and that it was hence he derived his name: for the same reason he was called *prophetes*, "the prophet." He had officers under him to do the same thing, or to assist him therein, who

3 R

were

Hierogrammatists
Hierophantes.

Hierophylax were also called *prophetes* and *exeges*, i. e. "explainers of divine things."

Highgate. To the hierophantes it belonged to dress and adorn the statues of the gods, and to bear them in processions and solemn ceremonies.

HIEROPHYLAX, an officer in the Greek church, who was guardian or keeper of the holy utensils, vestments, &c. answering to our sacrista or vestry-keeper.

HIGH, a term of relation, importing one thing's being superior or above another: thus we say, a *high* mountain, the *high* court of parliament, *high* relief, &c.

HIGH, in music, is sometimes used in the same sense with *loud*, and sometimes in the same sense with *acute*.

HIGH Dutch, is the German tongue in its greatest purity, &c. as spoken in Misnia, &c.

HIGH Operation, in chirurgery, is a method of extracting the stone; thus called, because the stone is taken out at the upper part of the bladder. See **SURGERY**.

HIGH-Places, were eminences on which the heathens used to worship their gods, chosen for that purpose as being supposed to be nearer heaven their constant residence. The Jews are frequently blamed for their attachment to high-places, after the manner of the Gentiles; though their *proseucha* were frequently upon mountains with groves planted about them. Where high-places are reprobated in scripture, therefore, we should understand them as abused and prostituted to idolatrous purposes. Before the temple was built, there was indeed nothing in the high-places very contrary to the law, provided God only was adored there, and that no incense or victims were offered to idols. Under the judges they seem to have been tolerated; and Samuel offered sacrifices in several places besides the tabernacle, where the ark was not present. Even in David's time, they sacrificed to the Lord at Shilo, Jerusalem, and Gibeon; but after the temple was built, and a place prepared for the fixed settlement of the ark, it was no more allowed of to sacrifice out of Jerusalem. Solomon, in the beginning of his reign, went a pilgrimage to Gibeon; but from that time we see no lawful sacrifices offered out of the temple.

HIGH Priest. See **PONTIFEX** and **PRIEST**.

HIGH Way, a free passage for the king's subjects; on which account it is called *the king's high way*, though the freehold of the soil belong to the owner of the land. Those ways that lead from one town to another, and such as are drift or cart ways, and are for all travellers in great roads, or that communicate with them, are high ways only; and as to their reparation, are under the care of surveyors.

HIGH-WAY MEN, are robbers on the high way; for the apprehending and taking of whom, a reward of 40*l.* is given by the statute of 4 and 5 W. & M. to be paid within a month after conviction by the sheriff of the county; to which the statute 8 Geo. II. cap. 16. superadds 10*l.* to be paid by the hundred indemnified by such taking.

HIGHAM FERRERS, an ancient borough of Northamptonshire in England, which has its name from the family of the Ferrers, to whom it formerly belonged, and who had a castle in its neighbourhood. It sends one member to parliament. E. Long. 1. 40. N. Lat. 52. 20.

HIGHGATE, a village five miles north of Lon-

don. It has its name from its high situation, and from a gate set up there about 400 years ago, to receive toll for the bishop of London, when the old miry road from Gray's-inn Lane to Barnet was turned through the bishop's park. There was a hermitage where the chapel now stands; and one of the hermits caused a causeway to be made between Highgate and Islington, with gravel dug out of the top of the hill, where there is now a pond. Near the chapel, in 1562, lord chief baron Cholmondely built and endowed a free school, which was enlarged in 1570 by Edwin Sandys bishop of London.—This village is a noted and airy retirement for the gentry and wealthy citizens; and is a place of good accommodation, besides its affording a delightful and pleasant prospect over the city and adjacent country.

HIGHLANDERS, a general appellation for the inhabitants of the mountainous parts of any country. In Britain, the name is appropriated to the people who inhabit the mountainous parts of Scotland, to the north and north-west, including those of the Hebrides or Western Isles.—They are a branch of the ancient Celtæ; and undoubtedly the descendants of the first inhabitants of Britain, as appears from the many monuments of their language still retained in the most ancient names of places in all parts of the island. The Highlanders, or, as they are often termed by ancient authors, the *Caledonians*, were always a brave, warlike, and hardy race of people; and, in the remotest times, seem to have possessed a degree of refinement in sentiment and manners then unknown to the other nations that surrounded them. This appears not only from their own traditions and poems, but also from the testimony of many ancient authors. This civilization was probably owing in a great measure to the order of the bards, or Druids, and some other institutions peculiar to this people.

The ancient Highlanders lived in the hunting state till some time after the era of Fingal, who was one of their kings towards the close of the third century. For some ages after that, they turned their chief attention to the pastoral life, which afforded a less precarious subsistence. Till of late, agriculture in most parts of the Highlands made but little progress.

The Highlanders always enjoyed a king and government of their own, till Kenneth M'Alpine (anno 845), after having subdued the Pictish kingdom, transferred thither the seat of royalty. This event proved very unfavourable to the virtues of the Highlanders, which from this period began to decline. The country, no longer awed by the presence of the sovereign, fell into anarchy and confusion. The chieftains began to extend their authority, to form factions, and to foment divisions and feuds between contending clans. The laws were either too feeble to bind them, or too remote to take notice of them. Hence sprung all those evils which long disgraced the country, and disturbed the peace of its inhabitants. Robbery or plunder, providing it was committed on any one of an adverse clan or tribe, was countenanced and authorised; and their reprisals on one another were perpetual. Thus quarrels were handed down from one generation to another, and the whole clan were bound in honour to espouse the cause of every individual that belonged to it. By this means the genius of the people was greatly

Highland-
ers.

greatly altered; and the Highlanders of a few ages back were almost as remarkable for their irregular and disorderly way of life as their predecessors were for their civilization and virtue. It is from not attending to this distinction between the ancient Highlanders and their posterity in later times, that many have doubted the existence of those exalted virtues ascribed by their poets to the more ancient inhabitants of the country. But now that the power of the chieftains is again abolished, law established, and property secured, the genius of the people (where it is not hindered by some other extraneous cause) begins again to show itself in its genuine colours; and many of their ancient virtues begin to shine with conspicuous lustre. Justice, generosity, honesty, friendship, peace, and love, are perhaps nowhere more cultivated than among this people. But one of the strongest features which marked the character of the Highlanders in every age, was their hospitality and benevolence to strangers. At night the traveller was always sure to find a hearty welcome in whatever house he should go to; and the host thought himself happier in giving the entertainment than the guest in receiving it. Even with regard to their enemies, the laws of hospitality were observed with the most sacred regard. They who fought against each other in the day, could in the night feast, and even sleep together, in the same house. From the same principle, they were, in most other cases, so faithful to their trust, that they rarely betrayed any confidence reposed in them. A promise they thought as binding as an oath, and held it equally inviolable and sacred.

The Caledonians in all ages have been much addicted to poetry and music. The poems of Ossian, so universally repeated, and so highly esteemed by every Highlander, are a strong proof of the early proficiency of this people in the poetical art. Even to this day, notwithstanding the many disadvantages they labour under, the most illiterate of either sex discover frequently a genius for poetry, which often breaks forth in the most natural and simple strains, when love, grief, joy, or any other subject of song, demands it. Wherever their circumstances are so easy as to allow them any respite from toil, or any cheerfulness of spirits, a good portion of their time, especially of the winter-nights, is still devoted to the song and tale. This last species of composition is chiefly of the novel-kind, and is handed down by tradition like their poems. It was the work of the bards; and proved, while they existed, no contemptible entertainment. But since the extinction of that order, both the Gaelic poems and tales are in a great measure either lost or adulterated. —The genius and character of the Gaelic poetry is well known. It is tender, simple, beautiful, and sublime.

Among the ancient Highlanders, the harp was the chief instrument of music. It suited the mildness of their manners, and was well adapted to the peace and quiet which they enjoyed under their own kings. In a later period, however, when the constant quarrels of their chiefs, and the endless feuds of contending clans, turned all their thoughts to war, it was forced to give place to the bag-pipe, an instrument altogether of the martial kind, and therefore well suited to the state of the country at that time. But ever since the cause

which had brought this instrument in vogue has ceased to operate, the attention to it has been on the decline; so that the harp, with very little encouragement, might again resume the seat from which it was once expelled. —The most, and especially the oldest of the Highland music, having been composed to the harp, is of a soft, tender, and elegiac cast, as best suited to the genius of that instrument. These pieces are generally expressive of the passions of love and grief. Other pieces, which were composed in their state of war, and adapted to a different instrument, are altogether bold and martial. And many are of a sprightly and cheerful cast, the offspring of mirth, and the sport of fancy in the season of festivity. Many of these last are of the chorus kind; and are sung in almost all the exercises in which a number of people are engaged, such as rowing, reaping, fulling, &c. The time of these pieces is adapted to the exercises to which they are respectively sung. They greatly forward the work, and alleviate the labour. The particular music which is generally used by the Highlanders in their dances is well known by the name of *Strathspey reels*.

The language of the Highlanders is still the Gaelic; which, with many of their customs and manners, has been secured to them by their mountains and fastnesses, amidst the many revolutions which the rest of the island has undergone in so long a course of ages. The Gaelic seems to be the oldest and purest dialect which remains of the Celtic, as appears from its approaching the nearest to the names of places, &c. which that language left in most countries where it prevailed, and from its most obvious affinity to those tongues, ancient or modern, which have been in any measure derived from the old Celtic. The Gaelic has all the marks of an original and primitive language. Most of the words are expressive of some property or quality of the objects which they denote. This, together with the variety of its sounds (many of which, especially of those that express the soft and mournful passions, are peculiar to itself), renders it highly adapted for poetry. It is generally allowed to have been the language of court, in Scotland, till the reign of Malcom Canmore. The Gaelic epithet of *Can-more*, or “large head,” by which this king is distinguished, seems to intimate so much. In some particular parliaments at least, it was spoken much later, as in that held by Robert the Bruce at Ardochattan. That it has been formerly a good deal cultivated, appears from the style and complexion of its poems and tales, and from several ancient MSS. that have come down to the present times. To strangers the Gaelic has a forbidding aspect, on account of the number of its quiescent consonants (which are retained to mark the derivation of words and their variation in case and tense), but its sound is abundantly musical and harmonious; and its genius strong and masculine. Its alphabet consists of 18 letters, of which one is an aspirate, 12 are consonants, and five are vowels.

The Highlanders are beginning of late to apply to learning, agriculture, and especially to commerce, for which their country, every where indented with arms of the sea, is peculiarly favourable. Cattle is the chief staple of the country; but it produces more grain than would supply its inhabitants, if so much of it were not consumed in whisky. The natives

Highland-
ers.

Highmore. are beginning to avail themselves of their mines, woods, wool, and fisheries; and by a vigorous application, with the due encouragement of government, may become a prosperous and useful people.

The Highlanders are of a quick and penetrating genius, strongly tinctured with a curiosity or thirst of knowledge, which disposes them to learn any thing very readily. They are active and industrious, where oppression does not discourage them by secluding even the hope of thriving. They are remarkably bold and adventurous, which qualifies them for being excellent seamen and soldiers. They are generally of a middle size, rather above it than otherwise; their eyes are brisk and lively, their features distinctly marked, and their persons tight and well made. Their countenance is open and ingenuous, and their temper frank and communicative.

HIGHMORE (Joseph, Esq;) an eminent painter, was born in the parish of St James's, Garlickhithe, London, June 13. 1692, being the third son of Mr Edward Highmore, a coal-merchant in Thames-street. Having such an early and strong inclination to painting, that he could think of nothing else with pleasure, his father endeavoured to gratify him in a proposal to his uncle, who was serjeant-painter to king William, and with whom Mr (afterwards Sir James) Thornhill had served his apprenticeship. But this was afterwards for good reasons declined, and he was articulated as clerk to an attorney, July 18th 1707; but so much against his own declared inclination, that in about three years he began to form resolutions of indulging his natural disposition to his favourite art, having continually employed his leisure hours in designing, and in the study of geometry, perspective, architecture, and anatomy, but without any instructors except books. He had afterwards an opportunity of improving himself in anatomy, by attending the lectures of Mr Cheselden, besides entering himself at the painters academy in Great Queen-street, where he drew 10 years, and had the honour to be particularly noticed by Sir Godfrey Kneller, who distinguished him by the name of "the Young Lawyer." On June 13th 1714, his clerkship expired; and on March 26th 1715, he began painting as a profession, and settled in the city. In the same year Dr Brook Taylor published his "Linear Perspective: or, a new method of representing justly all manner of objects as they appear to the eye in all situations." On this complete and universal theory our artist grounded his subsequent practice; and it has been generally allowed, that few, if any of the profession at that time, were so thorough masters of that excellent but intricate system. In 1716, he married Miss Susanna Hiller, daughter and heiress of Mr Anthony Hiller of Effingham in Surrey; a young lady in every respect worthy of his choice. For Mr Cheselden's "Anatomy of the Human Body," published in 1722, he made drawings from the real subjects at the time of dissection, two of which were engraved for that work, and appear, but without his name, in tables xii. and xiii. In the same year, on the exhibition of "The Conscious Lover," written by Sir Richard Steele, Mr Highmore addressed a letter to the author on the limits of filial obedience, pointing out a material defect in the character of Bevil, with that clearness and precision for which, in conversation and writing,

he was always remarkable, as the pencil by no means engrossed his whole attention. His reputation and business increasing, he took a more conspicuous station, by removing to a house in Lincoln's-Inn Fields, in March 1723-4; and an opportunity soon offered of introducing him advantageously to the nobility, &c. by his being desired, by Mr Pine the engraver, to make the drawings for his prints of the knights of the bath, on the revival of that order in 1725. In consequence, several of the knights had their portraits also by the same hand, some of them whole lengths; and the duke of Richmond, in particular, was attended by his three esquires, with a perspective view of king Henry VIIIth's chapel. This capital picture is now at Godwood. And our artist was sent for to St James's by George I. to draw the late duke of Cumberland, from which Smith scraped a mezzotinto.

In 1728, Mr Hawkins Browne, then of Lincoln's-Inn, who had ever a just sense of his talents and abilities, addressed to him a poetical epistle "On Design and Beauty;" and, some years after, an elegant Latin Ode, both now collected in his poems. In the summer of 1732, Mr Highmore visited the continent, in company with Dr Pemberton, Mr Benjamin Robins, and two other friends, chiefly with a view of seeing the gallery of pictures belonging to the elector Palatine at Dusseldorp, collected by Rubens, and supposed the best in Europe. At Antwerp also he had peculiar pleasure in contemplating the works of his favourite master. In their return they visited the principal towns in Holland. In 1734, he made a like excursion, but alone, to Paris, where he received great civilities from his countrymen then there, particularly the duke of Kingston, Dr Hickman (his tutor), Robert Knight, Esq; (the late cashier), &c. Here he had the satisfaction of being shown, by cardinal de Polignac, his famous group of antique statues, the court of Lycomedes, then just brought from Rome, and since purchased by the king of Prussia, and destroyed at Charlottenbourg in 1760 by the Russians. In 1742, he had the honour to paint the late prince and princess of Wales for the duke of Saxe Gotha; as he did some years after the late queen of Denmark for that court. The publication of "Pamela," in 1744, gave rise to a set of paintings by Mr Highmore, which were engraved by two French engravers, and published by subscription in 1745. In the same year he painted the only original of the late general Wolfe, then about 18. His Pamela introduced him to the acquaintance and friendship of the excellent author whose picture he drew, and for whom he painted the only original of Dr Young. In 1750 he had the misfortune to lose his wife. On the first institution of the academy of painting, sculpture, &c. in 1753, he was elected one of the professors; an honour which, on account of his many avocations, he desired to decline. In 1754 he published "A critical examination of those two Paintings [by Rubens] on the Ceiling of the Banqueting-house at Whitehall, in which Architecture is introduced, so far as relates to Perspective; together with the Discussion of a Question which has been the Subject of Debate among Painters:" printed in 4to. In the solution of this question, he proved that Rubens and several other great painters were mistaken in the practice, and Mr Kirby and several

Highmore. veral other authors in the theory. And in the 17th volume of the "Monthly Review," he animadverted (anonymously) on Mr Kirby's unwarrantable treatment of Mr Ware, and detected and exposed his errors, even when he exults in his own superior science. Of the many portraits which Mr Highmore painted, in a large practice of 46 years (of which several have been engraved), it is impossible and useless to discuss particulars. Some of the most capital in the historical branch, which was then much less cultivated than it is at present, shall only be mentioned, viz. "Hagar and Ishmael," a present to the Foundling-hospital: "The good Samaritan," painted for Mr Shepherd of Campsey Ash: "The finding of Moses," purchased at his sale by colonel (now general) Lister: "The Harlowe family, as described in Clarissa," now in the possession of Thomas Watkinson Payler, Esq; at Heden in Kent: "Clarissa," the portrait mentioned in that work: "The Graces unveiling Nature," drawn by memory from Rubens: "The Clementina of Grandison, and the queen mother of Edward IV. with her younger son, &c. in Westminster abbey;" the three last in the possession of his son.

In 1761, on the marriage of his daughter to the Rev. Mr Duncombe, son to one of his oldest friends, he took a resolution of retiring from business, and disposing of his collection of pictures, which he did by auction, in March 1762, and soon after removed to his son-in-law's at Canterbury, where he passed the remainder of his life without ever revisiting the metropolis. But though he had laid down the pencil, he never wanted employment: so active and vigorous was his mind, that, with a constitutional flow of spirits, and a relish for instructive society, he was never less "alone than when alone;" and, besides his professional pursuits above mentioned, to philosophy, both natural and moral, and also divinity, he laudably dedicated his time and attention. No man had more clearness and precision of ideas, or a more ardent desire to know the truth; and, when known, conscientiously to pursue it. With strong passions, ever guided by the strictest virtue, he had a tender, susceptible heart, always open to the distresses of his fellow-creatures, and always ready to relieve them. His capital work of the literary kind was his "Practice and perspective, on the principles of Dr Brook Taylor, &c." written many years before, but not published till 1763, when it was printed for Nourse, in one vol. 4to. This not only evinced his scientific knowledge of the subject, but removed, by its perspicuity, the only objection that can be made to the system of Dr Taylor. It accordingly received, from his friends and the intelligent public, the applauses it deserved. In 1765 he published (without his name) "Observations on a Pamphlet intituled, 'Christianity not founded on Argument;'" in which, after showing that it is a continued irony, and lamenting that so ample a field should be offered the author of it for the display of his sophistry; he gives up creeds, articles, and catechisms, as out-works raised by fallible men, and, confining himself to the defence of the gospel, or citadel, shows, that pure primitive Christianity, though assaulted by infidels, will ever remain impregnable. His opinion of Rubens may be seen in the Gentleman's Magazine for 1766, p. 353, under the title of "Remarks on some passages in Mr Webb's inquiry

into the Beauties of Painting, &c." In the same Highmore, year he published, with only his initials, "J. H." two small volumes of "Essays, moral, religious, and miscellaneous; with a Translation in prose of Mr Browne's Latin Poem on the Immortality of the Soul," selected from a large number written at his leisure, at different periods of life. "As such (says Dr Hawkesworth) they do the author great credit. They are not excursions of fancy, but efforts of thought, and indubitable indications of a vigorous and active mind." In the Gentleman's Magazine for 1769, p. 287, he communicated "A natural and obvious Manner of constructing Sun-dials, deduced from the Situation and Motion of the Earth with respect to the Sun," explained by a scheme. And in that for 1778, p. 526, his remarks on colouring, suggested by way of a note on the "Epistle to an eminent Painter," will show that his talents were by no means impaired at the age of 86. Indeed he retained them to the last, and had even strength and spirit sufficient to enable him to ride out daily on horseback the summer before he died. A strong constitution, habitual temperance, and constant attention to his health in youth as well as in age, prolonged his life, and preserved his faculties to his 88th year, when he gradually ceased to breathe, and, as it were, fell asleep on March 3. 1780. He was interred in the south aisle of Canterbury cathedral, leaving one son, Anthony, educated in his own profession; and a daughter, Susanna, mentioned above.

His abilities as a painter appear in his works, which will not only be admired by his contemporaries, but by their posterity; as his tints, like those of Rubens and Vandyck, instead of being impaired, are improved by time, which some of them have now withstood above 60 years. His idea of beauty, when he indulged his fancy, was of the highest kind; and his knowledge of perspective gave him great advantages in family-pieces, of which he painted more than any one of his time. He could take a likeness by memory as well as by a sitting, as appears by his picture of the duke of Lorraine (the late emperor), which Faber engraved; and those of king George II. (in York-assembly-room); queen Caroline, the two Miss Gunnings, &c. Like many other great painters, he had "a poet for his friend," in the late Mr Browne; to which may be added a poem addressed to him in 1726, by the Rev. Mr Bunce, at that time of Trinity-hall, Cambridge, who succeeded Mr Highmore, and in 1780 was vicar of St Stephen's near Canterbury.

HIGHNESS, a quality or title of honour given to princes.—The kings of England and Spain had formerly no other title but that of *highness*; the first till the time of James I. and the second till that of Charles V. The petty princes of Italy began first to be complimented with the title of *highness* in the year 1630.—The duke of Orleans assumed the title of *royal highness* in the year 1631, to distinguish himself from the other princes of France.

The duke of Savoy, late king of Sardinia, bore the title of *royal highness*, on account of his pretensions to the kingdom of Cyprus.—It is said that duke only took the title of *royal highness*, to put himself above the duke of Florence, who was called *great duke*; but the great duke afterwards assumed the title of *royal highness*, to put himself on a level with the duke of Savoy.

Hilaria
||
Hilarodi.

The prince of Conde first took the title of *most serene highness*, leaving that of simple *highness* to the natural princes.

HILARIA, in antiquity, feasts celebrated every year by the Romans on the 8th of the calends of April, or the 25th of March, in honour of Cybele the mother of the gods.

The hilaria were solemnized with great pomp and rejoicing. Every person dressed himself as he pleased, and took the marks or badges of whatever dignity or quality he had a fancy for. The statue of the goddess was carried in procession through the streets of the city, accompanied by multitudes in the most splendid attire. The day before the festival was spent in tears and mourning. Cybele represented the earth, which at this time of the year begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitude of the seasons, which succeeded one another.

The Romans took this feast originally from the Greeks, who called it *αναβασις*, q. d. *ascensus*; the eve of that day they spent in tears and lamentations, and thence denominated it *καταβασις*, *descensus*.

Afterwards, the Greeks took the name *ἡλάρια* from the Romans; as appears from Photius, in his extract of the life of the philosopher Isidore.

Casaubon maintains, that beside this particular signification, the word hilaria was also a general name for any joyful or festival day, whether public or private and domestic. But Salmasius does not allow of this.

Tristan, tom. i. p. 482, distinguishes between hilaria and hilaria. The former, according to him, were public rejoicings; and the latter, prayers made in consequence thereof; or even of any private feast or rejoicing, as a marriage, &c. The public lasted several days; during which, all mourning and funeral ceremonies were suspended.

HILARIUS, an ancient father of the Christian church, who flourished in the 4th century. He was born, as St Jerome informs us, at Poitiers, of a good family; who gave him a liberal education in the Pagan religion, and which he did not forsake till he was arrived at maturity. He was advanced to the bishopric of Poitiers in the year 355, according to Baronius; and became a most zealous champion for the orthodox faith, particularly against the Arians, who were at that time gaining ground in France. He assembled several councils there, in which the determinations of the synods of Rimini and Seleucia were condemned. He wrote a treatise concerning synods; and a famous work in 12 books on the Trinity, which is much admired by the orthodox believers. He died in the latter end of the year 367. His works have been many times published; but the last and best edition of them was given by the Benedictines at Paris in 1693.

HILARODI, in the ancient music and poetry, a sort of poets among the Greeks, who went about singing little gay poems or songs, somewhat graver than the Ionic pieces, accompanied with some instrument. From the streets they were at last introduced into tragedy, as the magodi were into comedy. They appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepida, being only a sole tied over with a strap.

HILARY-TERM. See TERM.

HILDESHEIM, a small district of Germany, in the circle of Lower Saxony. It lies between the duchies of Lunenburg and Brunswick; and may be about 25 miles from east to west, and 36 from north to south. It is watered by the rivers Leine and Innersty. The soil is fertile; and its principal places are Peine, Sarstedt, Bruggen, and Alveld. Hildesheim, from whence it takes its name, is governed as an imperial city. Its bishop is now elector of Cologne.

HILDESHEIM, a strong city of Germany, in Lower Saxony, with a Roman-catholic bishop's see, whose bishop is sovereign. It is a free imperial city, tho' in some things dependent on the bishop. It is a large town, well built and fortified. It is divided into the Old Town and the New, which have each their separate council. It is seated on the river Irnest, in E. Long. 10. 0. N. Lat. 52. 17.

HILL, a term denoting any considerable eminence on the earth's surface. It is sometimes synonymous with the word *mountain*; though generally it denotes only the lesser eminences, the word *mountain* being particularly applied to the very largest. See MOUNTAIN.

HILL (Aaron), a poet of considerable eminence, the son of a gentleman of Malmesbury-abbey in Wiltshire, was born in 1685. His father's imprudence having cut off his paternal inheritance, he left Westminster school at 14 years of age; and embarked for Constantinople, to visit lord Paget the English ambassador there, who was his distant relation. Lord Paget received him with surprize and pleasure, provided him a tutor, and sent him to travel: by which opportunity he saw Egypt, Palestine, and a great part of the east; and returning home with his noble patron, visited most of the courts of Europe. About the year 1709, he published his first poem intitled *Camillus*, in honour of the earl of Peterborough who had been general in Spain; and being the same year made master of Drury-lane theatre, he wrote his first tragedy, *Elfred*, or the fair Inconstant. In 1710, he became master of the opera-house in the Hay-market; when he wrote an opera called *Rinaldo*, which met with great success, being the first that Mr Handel set to music after he came to England. Unfortunately for Mr Hill, he was a projector as well as poet, and in 1715 obtained a patent for extracting oil from beech-nuts; which undertaking, whether good or bad, miscarried after engaging three years of his attention. He was also concerned in the first attempt to settle the colony of Georgia; from which he never reaped any advantage: and in 1728 he made a journey into the Highlands of Scotland, on a scheme of applying the woods there to ship-building; in which also he lost his labour. Mr Hill seems to have lived in perfect harmony with all the writers of his time, except Mr Pope, with whom he had a short paper-war, occasioned by that gentleman's introducing him in the *Dunciad*, as one of the competitors for the prize offered by the goddesses of Dullness, in the following lines:

"Then Hill essay'd; scarce vanish'd out of sight,
"He buoys up instant, and returns to light;
"He bears no token of the fabler's streams,
"And mounts far off among the Swans of Thames."

This, though far the gentlest piece of satire in the whole poem,

Hilary
||
Hill.

Hill. poem, and conveying at the same time an oblique compliment, roused Mr Hill to take some notice of it; which he did by a poem written during his peregrination in the north, intitled, "The progress of wit, a caveat for the use of an eminent writer;" which he begins with the following eight lines, in which Mr Pope's too well-known disposition is elegantly, yet very severely characterized:

"Tuneful *Alexis* on the Thames' fair side,
 "The Ladies play-thing and the Muses pride;
 "With merit popular, with wit polite,
 "Easy tho' vain, and elegant tho' light;
 "Desiring and deserving others praise;
 "Poorly accepts a Fame he ne'er repays:
 "Unborn to cherish, sneakingly approves;
 "And wants the soul to spread the worth he loves."

The *sneakingly approves*, in the last couplet, Mr Pope was much affected by; and indeed through their whole controversy afterwards, in which it was generally thought that Mr Hill had much the advantage, Mr Pope seems rather to express his repentance by denying the offence, than to vindicate himself supposing it to have been given. Besides the above poems, Mr Hill, among many others, wrote one, called *The northern star*, upon the actions of Czar Peter the Great; for which he was several years afterwards complimented with a gold medal from the empress Catharine, according to the Czar's desire before his death. He likewise altered some of Shakespeare's plays, and translated some of Voltaire's. His last production was *Merope*; which was brought upon the stage in Drury-lane by Mr Garrick. He died on the 8th of February 1749, as it is said, in the very minute of the earthquake; and after his decease four volumes of his works in prose and verse were published in octavo, and his dramatic works in two volumes.

HILL (Sir John), a voluminous writer, was originally bred an apothecary; but his marrying early, and without a fortune, made him very soon look round for other resources than his profession. Having, therefore, in his apprenticeship, attended the botanical lectures of the company, and being possessed of quick natural parts, he soon made himself acquainted with the theoretical as well as practical parts of botany: from whence being recommended to the late duke of Richmond and lord Petre, he was by them employed in the inspection and arrangement of their botanic gardens. Assisted by the liberality of these noblemen, he executed a scheme of travelling over the kingdom, to collect the most rare and uncommon plants; which he afterward published by subscription: but after great researches and uncommon industry, this undertaking turned out by no means adequate to his expectation. The stage next presented itself, as a soil in which genius might stand a chance of flourishing: but after two or three unsuccessful attempts, it was found he had no pretensions either to the sock or buskin; which once more reduced him to his botanical pursuits, and his business as an apothecary. At length, about the year 1746, he translated from the Greek, a small tract, written by Theophrastus, on Gems, which he published by subscription; and which, being well executed, procured him friends, reputation, and money. Encouraged by this, he engaged in works of greater extent and importance. The first he undertook was A general natural history, in 3 vols folio. He next engaged, in conjunction with George Lewis Scott, Esq; in furnishing a Supplement

to Chambers's Dictionary. He at the same time started the British Magazine; and while he was engaged in a great number of these and other works, some of which seemed to claim the continued attention of a whole life, he carried on a daily essay, under the title of *Inspector*. Amidst this hurry of business, Mr Hill was so laborious and ready in all his undertakings, and was withal so exact an economist of his time, that he scarcely ever missed a public amusement for many years: where, while he relaxed from the severer pursuits of study, he gleaned up articles of information for his periodical works. It would not be easy to trace Mr Hill, now Dr Hill (for he procured a diploma from the college of St Andrew's) through all his various pursuits in life. A quarrel he had with the Royal Society, for being refused as a member, which provoked him to ridicule that learned body, in A review of the works of the Royal Society of London, 4to, 1751; together with his over-writing himself upon all subjects without reserve; made him sink in the estimation of the public nearly in the same pace as he had ascended. He found as usual, however, resources in his own invention. He applied himself to the preparation of certain simple medicines: such as the essence of water-dock, tincture of valerian, balsam of honey, &c. The well-known simplicity of these medicines made the public judge favourably of their effects, insomuch that they had a rapid sale, and once more enabled the doctor to figure in that style of life ever so congenial to his inclination. Soon after the publication of the first of these medicines, he obtained the patronage of the earl of Bute, through whose interest he acquired the management of the royal gardens at Kew, with an handsome salary: and to wind up the whole of an extraordinary life, having, a little before his death, seized an opportunity to introduce himself to the knowledge of the king of Sweden, that monarch invested him with one of the orders of his court, which title he had not the happiness of enjoying above two years. He died toward the close of the year 1775.

HILLEL, senior, of Babylon, president of the sanhedrim of Jerusalem. He formed a celebrated school there, in which he maintained the oral traditions of the Jews against Shamai, his colleague, whose disciples adhered only to the written law; and this controversy gave rise to the sects of Pharisees and Scribes. He was likewise one of the compilers of the Talmud. He also laboured much at giving a correct edition of the sacred text; and there is attributed to him an ancient manuscript bible, which bears his name. He flourished about 30 years B. C. and died in a very advanced age.

HILLEL, the nasi, or prince, another learned Jew, the grandson of Judas Hakkadosh, or the Saint, the author of the Mishna, lived in the fourth century. He composed a cycle; and was one of the principal doctors of the Gamara. The greatest number of the Jewish writers attribute to him the correct edition of the Hebrew text which bears the name of *Hillel*, which we have already mentioned in the preceding article. There have been several other Jewish writers of the same name.

HILLIA, in botany: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is hexaphyllous; the corolla

Hill
 ||
 Hillia.

Hillsbo-
rough
||
Hinckley.

rolla cleft in six parts, and very long; the berry inferior, bilocular, and polyspermous.

HILLSBOROUGH, a borough, fair, and post-town, in the county of Down, and province of Ulster, 69 miles from Dublin. Here is a fine seat of the earl of Hillsborough. The town is pleasantly situated and almost new built, in view of Lisburn, Belfast, and Carrickfergus bay; the church is magnificent, having an elegant spire, as lofty as that of St Patrick's in Dublin, and seven painted windows. Here is an excellent inn, and a thriving manufacture of muslins. It has three fairs, and sends two members to parliament. This place gives title of earl to the family of Hillsborough. N. Lat. 54. 30. W. Long. 6. 20.

HILUM, among botanists, denotes the eye of a bean.

HIMERA (anc. geog.), the name of two rivers in Sicily; one running northwards into the Tuscan sea, now called *Fiume di Termini*; and the other southwards into the Lybian; dividing Sicily into two parts, being the boundary between the Syracusans to the east and Carthaginians to the west; not rising from the same, but from different springs.

HIMERA (anc. geog.), a town of Sicily, at the mouth of the Himera, which ran northwards, on its left or west side: A colony of Zancle: afterwards destroyed by the Carthaginians (Diodorus Siculus).

HIMERENSES THERMAE (anc. geog.), a town of Sicily, on the east side of that Himera which runs to the north. After the destruction of the town of Himera by the Carthaginians, such of the inhabitants as remained, settled in the same territory, not far from the ancient town. Now Termini. Made a Roman colony by Augustus.

HIN, a Hebrew measure of capacity for things liquid, containing the sixth part of an ephah, or one gallon two pints English measure.

HINCKLEY, a market-town of Leicestershire, built on a rising ground, nearly on the borders of Leicestershire, from which it is separated by the Roman Watling-street road. It is distant from Coventry and Leicester 15 miles each, and 102 from London. It has been much larger than it is at present, the back lanes between the orchards having evidently been streets originally, and the traces of the town-wall and ditch are in many places yet visible. There are vestiges of two Roman works, viz. the mount near the river, and the ruins of a bath near St Nicholas church, where tessellated pavements have been dug up. The Jewery wall is said to have been the temple of Janus. The castle was inhabited by John of Gaunt; but is now no more, the scite being converted into garden-ground, the castle-hill considerably lowered, and a gentleman's house erected on the spot in 1770. The steeple of the present church was built with some of the stones of the castle. The town is now divided into the borough, and the bond without the liberties. It has a good market on Mondays, and a fair in August. The chief manufacture is stockings and fine ale. The town is said to contain about 750 houses. There are two churches, one chapel, and a place of worship for the Roman Catholics, besides four meeting-houses. The church is a neat large old structure with a modern tower and a spire, the body of it was built in the 13th century, and near it are three mineral springs. This town is said to be the middle and highest ground in

N^o 153.

England; and from it 50 churches may be seen, besides gentlemen's seats. It received great damage by a fire Sept. 5. 1728.

HIND, a female stag in the third year of its age. See **CERVUS**.

HINDON, a small town of Wiltshire in England, which sends two members to parliament. It is situated in E. Long. 2. 14. N. Lat. 51. 12.

HINDOOS, or **GENTOOS**, the inhabitants of that part of India known by the name of *Hindostan* or the *Mogul's empire*, who profess the religion of the Bramins, supposed to be the same with that of the ancient Gymnosophists of Ethiopia.

From the earliest period of history these people seem to have maintained the same religion, laws, and customs, which they do at this day: and indeed they and the Chinese are examples of perseverance in these respects altogether unknown in the western world. In the time of Diodorus Siculus they are said to have been divided into seven casts or tribes; but the intercourse betwixt Europe and India was in his time so small, that we may well suppose the historian to have been mistaken, and that the same tenacity for which they are so remarkable in other respects has manifested itself also in this. At present they are divided only into four tribes; 1. The Bramin; 2. The Khatry; 3. The Bhyse; and, 4. The Soodera. All these have distinct and separate offices, and cannot, according to their laws, intermingle with each other; but for certain offences they are subject to the loss of their cast, which is reckoned the highest punishment they can suffer; and hence is formed a kind of fifth cast named *Pariars* on the coast of Coromandel, but in the Sanscrit or sacred language *Ghandalas*. These are esteemed the dregs of the people, and are never employed but in the meanest offices. There is besides a general division which pervades the four casts indiscriminately; and which is taken from the worship of their gods *Vishnou* and *Sheevah*; the worshippers of the former being named *Vishnou-bukht*; of the latter, *Sheevah-bukht*.

Of these four casts the bramins are accounted the foremost in every respect; and all the laws have such an evident partiality towards them, as cannot but induce us to suppose that they have had the principal hand in framing them. They are not, however, allowed to assume the sovereignty; the religious ceremonies and the instruction of the people being their peculiar province. They alone are allowed to read the *Veda* or sacred books; the *Khatries*, or cast next in dignity, being only allowed to hear them read; while the other two can only read the *Sastras* or commentaries upon them. As for the poor *Chandalas*, they dare not enter a temple, or be present at any religious ceremony.

In point of precedence the bramins claim a superiority even to the princes; the latter being chosen out of the Khatry or second cast. A rajah will receive with respect the food that is prepared by a brahman, but the latter will eat nothing that has been prepared by any member of an inferior cast. The punishment of a bramini for any crime is much milder than if he had belonged to another tribe; and the greatest crime that can be committed is the murder of a bramini. No magistrate must desire the death of one of these sacred persons, or cut off one of his limbs. They must be

be

Hindoos. be readily admitted into the presence even of princes whenever they please: when passengers in a boat, they must be the first to enter and to go out; and the waterman must besides carry them for nothing; every one who meets them on the road being likewise obliged to give place to them.

All the priests are chosen from among this order, such as are not admitted to the sacerdotal function being employed as secretaries and accountants. These can never afterwards become priests, but continue to be greatly revered by the other casts.

The Khatry or second cast are those from among whom the sovereigns are chosen.—The Bhyse or Banians, who constitute the third cast, have the charge of commercial affairs; and the Soodera, or fourth cast, the most numerous of all, comprehend the labourers and artisans. These last are divided into as many classes as there are followers of different arts; all the children being invariably brought up to the profession of their fathers, and it being absolutely unlawful for them ever to alter it afterwards.

No Hindoo is allowed to quit the cast in which he was born upon any account. All of them are very scrupulous with regard to their diet; but the bramins much more so than any of the rest. They eat no flesh, nor shed blood; which we are informed by Porphyry and Clemens Alexandrinus was the case in their time. Their ordinary food is rice and other vegetables, dressed with *ghree* (a kind of butter melted and refined so as to be capable of being kept for a long time), and seasoned with ginger and other spices. The food which they most esteem, however, is milk as coming from the cow; an animal for which they have the most extravagant veneration, insomuch that it is enacted in the code of Gentoo laws, that any one who exacts labour from a bullock that is hungry or thirsty, or that shall oblige him to labour when fatigued or out of season, is liable to be fined by the magistrates. The other casts, though less rigid, abstain very religiously from what is forbidden them; nor will they eat any thing provided by a person of an inferior cast, or by one of a different religion. Though they may eat some kinds of flesh and fish, yet it is counted a virtue to abstain from them all. None of them are allowed to taste intoxicating liquor of any kind. Quintus Curtius indeed mentions a sort of wine made use of by the Indians in his time; but this is supposed to have been no other than toddy, or the unfermented juice of the cocoa nut. This when fermented affords a spirit of a very unwholesome quality; but it is drunk only by the Chandalas and the lower class of Europeans in the country. So exceedingly bigotted and superstitious are they in their absurd maxims with regard to meat and drink, that some Seapoys in a British ship having expended all the water appropriated to their use, would have suffered themselves to perish for thirst rather than taste a drop of that which was used by the ship's company.

² **of the religion of the Hindoos.** The religion of the Hindoos, by which these maxims are inculcated, and by which they are made to differ so much from other nations, is contained in certain books named *Veda*, *Vedams*, or *Beds*, written in a language called *Shanscrit*, which is now known only to the learned among them. The books are supposed to have been the work not of the supreme God himself, but of

an inferior deity named Brimha. They inform us, that Brama, or Brahma, the supreme God, having created the world by the word of his mouth, formed a female deity named Bawaney, who in an enthusiasm of joy and praise brought forth three eggs. From these were produced three male deities, named *Brimha*, *Vishnou*, and *Sheevah*. Brimha was endowed with the power of creating the things of this world, Vishnou with that of cherishing them, and Sheevah with that of restraining and correcting them. Thus Brimha became the creator of man; and in this character he formed the four casts from different parts of his own body, the Bramins from his mouth, the Khatry from his arms, the Banians from his belly and thighs, and the Soodera from his feet. Hence, say they, these four different casts derive the different offices assigned them; the Bramins to teach; the Khatry to defend and govern; the Banians to enrich by commerce and agriculture; and the Soodera to labour, serve, and obey. Brama himself endowed mankind with passions, and understanding to regulate them; while Brimha, having created the inferior beings, proceeded to write the Vedams, and delivered them to be read and explained by the bramins.

The religion of the Hindoos, though involved in superstition and idolatry, seems to be originally pure; inculcating the belief of an eternal and omnipotent Being; their subordinate deities Brimha, Vishnou, and Sheevah, being only representatives of the wisdom, goodness, and power, of the supreme God Brama. All created things they suppose to be *types* of the attributes of Brama, whom they call the *principle of truth*, the *spirit of wisdom*, and the *supreme being*; so that it is probable that all their idols were at first only designed to represent these attributes.

There are a variety of sects among the Hindoos: ³ Different sects. two great classes we have mentioned already, viz. the worshippers of Vishnou and those of Sheevah; and these distinguish themselves, the former by painting their faces with an horizontal line, the latter by a perpendicular one. There is, however, very little difference in point of religion between these or any other Hindoo sects. All of them believe in the immortality of the soul, a state of future rewards and punishments, and transmigration. Charity and hospitality are inculcated in the strongest manner, and exist among them not only in theory but in practice. "Hospitality (say they) is commanded to be exercised even towards an enemy, when he cometh into thine house; the tree doth not withdraw its shade even from the wood-cutter. Good men extend their charity even to the vilest animals. The moon doth not withhold her light even from the Chandala." These pure doctrines, however, are intermixed with some of the vilest and most absurd superstitions; and along with the true God they worship a number of inferior ones, of whom the principal are:

1. *Bawaney*, the mother of the gods, already mentioned, and superior to all but Brama himself; but all the other goddesses are reckoned inferior to their gods ⁴ Account of their principal deities.

2. *Brimha*, in the Shanscrit language said to mean "the wisdom of God;" and who is supposed to fly on the wings of the *banse* or flamingo; an image of which is constantly kept near that of the god in the temple

3 S where

Hindoos. where he is worshipped. He has a crown on his head, and is represented with four hands. In one of these he holds a sceptre, in another the sacred books or Vedam, in the third a ring or circle as the emblem of eternity, supposed to be employed in assisting and protecting his works.

3. *Serawatej*, the goddess or wife of Brimha, presides over music, harmony, eloquence, and invention. She is also said to be the inventress of the letters called *Devanagry*, by which the divine will was first promulgated among mankind. In the argument of an hymn addressed to this goddess, she is supposed to have a number of inferior deities acting in subordination to her. These are called *Rags*, and preside over each mode, and likewise over each of the seasons. These seasons in Hindostan are six in number; viz. 1. The *Seefar*, or dewy season. 2. *Heemat*, or the cold season. 3. *Vasant*, the mild season or spring. 4. *Greshma*, or the hot season. 5. *Varfa*, the rainy season. 6. *Sarat*, the breaking up or end of the rains.

The *Rags*, in their musical capacity, are accompanied each with five *Ragnies*, a kind of female deities or nymphs of harmony. Each of these has eight sons or genii; and a distinct season is appointed for the music of each rag, during which only it can be sung or played; and this at distinct and stated hours of the day or night. A seventh mode of music belonging to *Deipec*, or *Cupid the inflamer*, is said once to have existed, but now to be lost; and a musician, who attempted to restore it, to have been consumed with fire from heaven.

4. *Vishnou*, the most celebrated of all the Indian deities, is supposed to fly or ride on the garoora, a kind of large brown kite, which is found in plenty in the neighbourhood; and on which Vishnou is sometimes represented as sitting; though at others he is represented on a serpent with a great number of different heads. At some of his temples the bramins accustom all the birds they can find, of the species above mentioned, to come and be fed; calling them by striking upon a brass plate. This deity is said to have had ten different incarnations to destroy the giants with which the earth was infested; and in these he is represented in as many different figures, all of which are to the last degree fantastic and monstrous. His common form is that of a man with four hands, and a number of heads set round in a circle, supposed to be emblems of omniscience and omnipotence. In his first incarnation he is represented as coming out of the mouth of a fish, with several hands containing swords, &c. In another he has the head of a boar with monstrous tusks, bearing a city in the air, and stands upon a vanquished giant with horns on his head. In others of his incarnations, he has the head of a horse or other animals, with a great number of arms brandishing swords, &c.

In some parts of his character this deity is represented not as a destroyer, but a preserver of mankind; and he is then distinguished by the name of *Hary*. Bishop Wilkins describes an image of him in this character at a place named *Jehan-query*, a small rocky island of the Ganges in the province of Bahar. This image is of a gigantic size, recumbent on a coiled serpent, whose numerous heads are twisted by the artist into a kind of canopy over the sleeping god, and from each

of its mouths issues a forked tongue, as threatening destruction to those who should dare to approach. **Hindoos.**

5. *Sheevah* is represented under a human form, though frequently varied, as is also his name; but he is most frequently called *Sheevah* and *Mahadeg*. In his destroying character he is represented as a man with a fierce look, with a snake twisted round his neck. He is thought to preside over good and evil fortune, in token of which he is represented with a crescent on his head. He rides upon an ox.

6. *Vikrama*, the god of victory, is said to have had a particular kind of sacrifice offered to him, somewhat like the scape-goat of the Jews, viz. by letting a horse loose in the forest, and not employing him again.

7. *Yam Rajah*, or *Darham Rajah*, is represented as the judge of the dead, and ruler of the infernal regions, in a manner similar to the Minos and Pluto of the ancient Greeks. He is the son of *Sour*, "the sun," by *Bisookama* daughter of the great architect of the heavenly mansions, and patron of artificers. He rides upon a buffalo, with a sceptre in his hand, having two assistants, *Chiter* and *Gopt*; the former of whom reports the good, and the latter the bad actions of men. These are attended by two genii, who watch every individual of the human race; *Chiter's* spy being on the right, and *Gopt's* on the left. The souls of deceased persons are carried by the *Jambouts* or messengers of death into the presence of *Darham*, where his actions are instantly proclaimed, and sentence passed accordingly. The infernal mansions are named by the Hindoos *Narekha*, and are divided into a great number of places, according to the degrees of punishment to be endured by the criminal; but eternal punishment for any offence is supposed to be inconsistent with the goodness of God. Instead of this, the Hindoos suppose, that after the souls of the wicked have been punished long enough in *Narekha*, they are sent back into the world to animate other bodies either of men or beasts, according to circumstances. Those who have lived a life partly good and partly bad, are likewise sent back to this world; and these trials and transmigrations are repeated till they be thoroughly purged of all inclination to sin. But as for those holy men who have spent their lives in piety and devotion, they are instantly conveyed by the genii to the mansions of celestial bliss, where they are absorbed into the universal spirit; a state according to every idea we can form equivalent to annihilation!

8. *Krishen* and the nine *Gopia*, among the Hindoos, correspond with Apollo and the nine muses of the Greeks. This deity is represented as a young man sometimes playing on a flute. He has a variety of names, and is supposed to be of a very amorous complexion, having once resided in a district named *Birge*, where he embraced almost all the women in the country. From his residence here, or from these amorous exploits, he is sometimes called *Birge-put*.

9. *Kame-deva*, the god of love, is said to be the son of *Maya*, or the general attractive power; married to *Retty*, or *Affection*. He is represented as a beautiful youth, sometimes conversing with his mother or consort in his temples or gardens; at other times riding on a parrot by moonlight: And Mr Forster informs us, that on the taking of Tanjore by the English, a cu-

rious

^{5.} ^{Their de-} ^{demigods.} rious picture was found, representing him riding on an elephant, the body of which was composed of seven young women twisted together in such a manner as to represent that enormous animal. This is supposed to be a device of a similar nature with that of the Greeks, who placed their *Eros* upon a lion; thus intimating, that love is capable of taming the fiercest of animals. The bow of this deity is said to be of sugar-cane or of *flowers*, and the string of *bees*: he has five arrows, each of them tipped with an Indian blossom of an heating nature. His ensign is a fish on a red ground, carried by the foremost of his attendant nymphs or dancing girls.

10. *Lingam*, corresponding to the Priapus or Phallus of the ancients, is worshipped by the Hindoos in order to obtain fecundity. This deity is adored the more fervently, as they depend on their children for performing certain ceremonies to their manes, which they imagine will mitigate their punishment in the next world. The devotees of the god go naked, but are supposed to be such sanctified persons, that women may approach them without any danger. They vow perpetual chastity; and death is the consequence of a breach of their vow. Husbands whose wives are barren invite them to their houses, where certain ceremonies, generally thought to be effectual, are performed.

Besides these, there are a number of other gods whose character is less eminent, though we are by no means acquainted, nor are the Hindoos themselves perhaps, with the particular rank which each deity carries with respect to another. Some of these deities are, 11. *Nared*, the son of Brimha, and inventor of a fretted instrument named *Vene*. 12. *Lechemy*, the goddess of plenty, and wife of Vishnou. 13. *Gowry*, *Kaly*, from *Kala* "time;" the wife of Sheevah, and goddess of destruction. 14. *Varoona*, the god of the seas and waters, riding on a crocodile. 15. *Vayoo*, the god of the winds, riding on an antelope with a sabre in his hand. 16. *Agnee*, the god of fire, riding on a ram. 17. *Vasoodka*, a goddess representing the earth. 18. *Pakreety*, or nature, represented by a beautiful young woman. 19. *Sour* or *Shan*, the sun; called also the king of the stars and planets, represented as sitting in a chariot drawn by one horse, sometimes with seven and sometimes with twelve heads. 20. *Sangia*, the mother of the river Jumna, and wife of the sun. 21. *Chandava*, the moon, in a chariot drawn by antelopes, and holding a rabbit in her right hand. 22. *Vreekaspaty*, the god of learning, attended by beautiful young nymphs named *Veedyadhare*s, or professors of science. 23. *Ganes*, the god of prudence and policy, worshipped before the undertaking of any thing of consequence. 24. *Fame*, represented by a serpent with a great number of tongues; and known by several names. 25. *Darma-deva*, the god of virtue, sometimes represented by a white bull. 26. *Virsavana* or *Cobhair*, the god of riches, represented by a man riding on a white horse. 27. *Dhan-wantary*, the god of medicine.

Besides these supreme deities, the Hindoos have a number of demigods, who are supposed to inhabit the air, the earth, and the waters, and in short the whole world; so that every mountain, river, wood, town, village, &c. has one of these tutelar deities, as was the

case among the western heathens. By nature these demigods are subject to death, but are supposed to obtain immortality by the use of a certain drink named *Amrut*. Their exploits in many instances resemble those of Bacchus, Hercules, Theseus, &c. and in a beautiful epic poem named *Rancyan*, we have an account of the wars of Rain, one of the demigods, with Ravana tyrant of Ceylon.

All these deities are worshipped, as in other countries, by going to their temples, fasting, prayers, and the performance of ceremonies to their honour. They pray thrice a day, at morning, noon, and evening, turning their faces towards the east. They use many ablutions, and, like the Pharisees of old, they always wash before meals. Running water is always preferred for this purpose to such as stagnates. Fruits, flowers, incense, and money, are offered in sacrifice to their idols; but for the dead they offer a kind of cake named *Peenda*; and offerings of this kind always take place on the day of the full moon. Nothing sanguinary is known in the worship of the Hindoos at present, though there is a tradition that it was formerly of this kind; nay, that even human sacrifices were made use of: but if such a custom ever did exist, it must have been at a very distant period. Their sacred writings indeed make mention of bloody sacrifices of various kinds, not excepting even those of the human race: but so many peculiarities are mentioned with regard to the proper victims, that it is almost impossible to find them. The only instance of bloody sacrifices we find on record among the Hindoos is that of the buffalo to Bawaney, the mother of the gods.

Among the Hindoos there are two kinds of worship, distinguished by the name of the worship of the *invisible God* and of *idols*. The worshippers of the invisible God are, strictly speaking, deists: the idolaters perform many absurd and unmeaning ceremonies, too tedious to mention, all of which are conducted by a bramin; and during the performance of these rites, the dancing women occasionally perform in the court, singing the praises of the Deity in concert with various instruments. All the Hindoos seem to worship the fire; at least they certainly pay a great veneration to it. Bishop Wilkins informs us, that they are enjoined to light up a fire at certain times, which must be produced by the friction of two pieces of wood of a particular kind; and the fire thus produced is made use of for consuming their sacrifices, burning the dead, and in the ceremonies of marriage.

Great numbers of devotees are to be met with every where through Hindostan. Every cast is allowed to assume this way of life excepting the Chandalahs, who are excluded. Those held most in esteem are named *Seniasses* and *Jogeys*. The former are allowed no other clothing but what suffices for covering their nakedness, nor have they any worldly goods besides a pitcher and staff; but though they are strictly enjoined to meditate on the truths contained in the sacred writings, they are expressly forbidden to argue about them. They must eat but once a day, and that very sparingly, of rice or other vegetables; they must also show the most perfect indifference about hunger, thirst, heat, cold, or any thing whatever relative to this world; looking forward with continual desire to the separation of the soul from the body. Should any of them fail in this

Hindoo.

⁶ Manner of
worship.

⁷ Their de-
votees.

Hindoos. extravagant self-denial, he is rendered so much more criminal by the attempt, as he neglected the duties of ordinary life for those of another which he was not able to accomplish. The Yogeys are bound to much the same rules, and both subject themselves to the most extravagant penances. Some will keep their arms constantly stretched over their heads till they become quite withered and incapable of motion; others keep them crossed over their breast during life; while others, by keeping their hands constantly shut, have them quite pierced through by the growth of their nails. Some chain themselves to trees or particular spots of ground, which they never quit; others resolve never to lie down, but sleep leaning against a tree: but the most curious penance perhaps on record is that of a Yogey, who measured the distance between Benares and Jaggernaut with the length of his body, lying down and rising alternately. Many of these enthusiasts will throw themselves in the way of the chariots of Vishnou or Sheevah, which are sometimes brought forth in procession to celebrate the feast of a temple, and drawn by several hundreds of men. Thus the wretched devotees are in an instant crushed to pieces. Others devote themselves to the flames, in order to show their regard to some of their idols, or to appease the wrath of one whom they suppose to be offended.

A certain set of devotees are named *Pandarams*; and another on the coast of Coromandel are named *Cary-Patra Pandarams*. The former rub themselves all over with cow-dung, running about the country singing the praises of the god Sheevah whom they worship. The latter go about asking charity at doors by striking their hands together, for they never speak. They accept of nothing but rice; and when they have got as much as will satisfy their hunger, never give themselves any trouble about more, but pass the rest of the day in the shade, in a state of such supine indolence as scarce to look at any object whatever. The *Tadinums* are another set of mendicants, who sing the incarnations of Vishnou. They have hollow brass rings round their ancles, which they fill with pebbles; so that they make a considerable noise as they walk; they beat likewise a kind of tabor.

8. Mildness of the Hindoo religion. The greatest singularity in the Hindoo religion, however, is, that so far from persecuting those of a contrary persuasion, which is too often the case with other professors, they absolutely refuse even to admit of a proselyte. They believe all religions to be equally acceptable to the Supreme Being; assigning as a reason, that if the Author of the universe preferred one to another, it would have been impossible for any other to have prevailed than that which he approved. Every religion, therefore, they conclude to be adapted to the country where it is established; and that all in their original purity are equally acceptable.

9. Their marriages. Among the Hindoos, marriage is considered as a religious duty; and parents are strictly commanded to marry their children by the time they arrive at eleven years of age at farthest. Polygamy is allowed; but this licence is seldom made use of, unless there should be no children by the first wife. In case the second wife also proves barren, they commonly adopt a son from among their relations.

The Hindoos receive no dower with their wives;

but, on the contrary, the intended husband makes a present to the father of his bride. Nevertheless, in many cases, a rich man will choose a poor relation for his daughter; in which case the bride's father is at the expence of the wedding, receives his son-in-law into his house, or gives him a part of his fortune. The bridegroom then quits the dwelling of his parents with certain ceremonies, and lives with his father-in-law. Many formalities take place between the parties even after the match is fully agreed upon; and the celebration of the marriage is attended with much expence; magnificent processions are made, the bride and bridegroom sitting in the same palankeen, attended by their friends and relations; some riding in palankeens, some on horses, and others on elephants. So great is their vanity indeed on this occasion, that they will borrow or hire numbers of these expensive animals to do honour to the ceremony. The rejoicings last several days; during the evenings of which, fire-works and illuminations are displayed, and dancing women perform their feats; the whole concluding with alms to the poor, and presents to the bramins and principal guests, generally consisting of shawls, pieces of muslin, and other cloths. A number of other ceremonies are performed when the parties come of age, and are allowed to cohabit together. The same are repeated when the young wife becomes pregnant; when she passes the seventh month without any accident; and when she is delivered of her child. The relations assemble on the tenth day after the birth, to assist at the ceremony of naming the child; but if the bramins be of opinion that the aspect of the planets is at that time unfavourable, the ceremony is delayed, and prayers offered up to avert the misfortune. When the lucky moment is discovered, they fill as many pots with water as there are planets, and offer a sacrifice to them; afterwards they sprinkle the head of the child with water, and the bramin gives it such a name as he thinks best adapted to the time and circumstances; and the ceremony concludes with prayers, presents to the bramins, and alms to the poor. Mothers are obliged to suckle their own children; nor can this duty be dispensed with except in case of sickness. New ceremonies, with presents to the bramins, take place, when a boy comes of age to receive the string which the three first casts wear round their waist.

10. Education of children. Boys are taught to read and write by the bramins, who keep schools for that purpose throughout the country. They use leaves instead of books, and write with a pointed iron instrument. The leaves are generally those of the palm-tree, which being smooth and hard, and having a thick substance, may be kept for almost any length of time, and the letters are not subject to grow faint or be effaced. The leaves are cut into slips about an inch broad, and their books consist of a number of these tied together by means of a hole in one end. Sometimes the letters are rubbed over with a black powder, to render them more legible. When they write upon paper, they make use of a small reed. Sometimes they are initiated in writing by making letters upon sand strewed on the floor; and they are taught arithmetic by means of a number of small pebbles. The education of the girls is much more limited; seldom extending farther than the articles of their religion.

Among these people the custom of burning the dead prevails.

¹¹ **Hindoos.** prevails universally; and the horrid practice of wives burning themselves along with their deceased husbands was formerly very common, though now much less so. At present it is totally prohibited in the British dominions; and even the Mohammedans endeavour to discountenance a practice so barbarous, though many of their governors are accused of conniving at it through motives of avarice. At present it is most common in the country of the Rajahs, and among women of high rank.

¹¹ Barbarous custom of women burning themselves.

This piece of barbarity is not enjoined by any law existing among the Hindoos; it is only said to be *proper*, and rewards are promised in the next world to those who do so. But though a wife chooses to outlive her husband, she is in no case whatever permitted to marry again, even though the marriage with the former had never been completed. It is unlawful for a woman to burn herself if she be with child at the time of her husband's decease, or if he died at a distance from her. In the latter case, however, she may do so if she can procure his girdle or turban to be put on the funeral pile along with her. These miserable enthusiasts, who devote themselves to this dreadful death, suffer with the greatest constancy; and Mr Holwel gives an account of one who, being told of the pain she must suffer (with a view to dissuade her), put her finger into the fire and kept it there for a considerable time; after which she put fire on the palm of her hand, with incense upon it, and fumigated the bramins who were present. Sometimes a chapel is erected on the place where one of those sacrifices has been performed; sometimes it is inclosed, flowers planted upon it, and images set up.—In some few places the Hindoos bury their dead; and some women have been known to suffer themselves to be buried alive with their deceased husbands: but the instances of this are still more rare than those of burning.—No woman is allowed any inheritance among the Hindoos; so that if a man dies without male issue, his estate goes to his adopted son or to his nearest relation.

¹² Instances of heroism among the Hindoos.

The Hindoos, though naturally mild and timid, will on many occasions meet death with the most heroic intrepidity. An Hindoo who lies at the point of death, will talk of his decease with the utmost composure; and if near the river Ganges, will desire to be carried out, that he may expire on its banks. Such is the excessive veneration they have for their religion and customs, that no person will infringe them even to preserve his own life. An Hindoo, we are told, being ill of a putrid fever, was prevailed upon to send for an European physician, who prescribed him the bark in wine; but this was refused with the greatest obstinacy even to the very last, though the governor himself joined in his solicitations, and in other matters had a considerable influence over him. In many instances these people, both in ancient and modern times, have been known, when closely besieged by an enemy whom they could not resist, to kill their wives and children, set fire to their houses, and then violently rush upon their adversaries till every one was destroyed. In the late war, some Seapoys in the British service, having been concerned in a mutiny, were condemned to be blown away from the mouths of cannon. Some grenadiers cried out, that as they had all along had the post of honour, they saw no reason why they should be denied it now;

and therefore desired that they might be blown away first. This being granted, they walked forward to the guns with composure, begged that they might be spared the indignity of being tied, and, placing their breasts close to the muzzles, were shot away. The commanding officer was so much affected with this instance of heroism, that he pardoned all the rest.

In ordinary life the Hindoos are cheerful and lively; Their general character. fond of conversation and amusements, particularly dancing. They do not, however, learn or practise dancing themselves, but have women taught for the purpose; and in beholding these they will spend whole nights. They disapprove of many parts of the education of European ladies, as supposing that they engage the attention too much, and draw away a woman's affection from her husband and children. Hence there are few women in Hindostan who can either read or write. In general they are finely shaped, gentle in their manners, and have soft and even musical voices. The women of Kashmere, according to Mr Forster, have a bright olive complexion, fine features, and delicate shape; a pleasing freedom in their manners, without any tendency to immodesty.

¹⁴ The dress of the modest women in Hindostan consists of a close jacket, which covers their breasts, but perfectly shows their form. The sleeves are tight, and reach half way to the elbows, with a narrow border painted or embroidered all round the edges. Instead of a petticoat, they have a piece of white cotton cloth wrapped round the loins, and reaching near the ankle on the one side, but not quite so low on the other. A wide piece of muslin is thrown over the right shoulder; which, passing under the left arm, is crossed round the middle, and hangs down to the feet. The hair is usually rolled up into a knot or bunch towards the back part of the head; and some have curls hanging before and behind the ears. They wear bracelets on their arms, rings in their ears, and on their fingers, toes and ankles; with sometimes a small one in their nostril.

¹⁴ Dress of the women.

The dress of the dancing women, who are likewise votaries of Venus, is very various. Sometimes they wear a jama, or long robe of wrought muslin, or gold and silver tissue; the hair plaited and hanging down behind, with spiral curls on each side of the face. They are taught every accomplishment which can be supposed to captivate the other sex; form a class entirely different from the rest of the people, and live by their own rules. Their clothes, jewels, and lodging, are considered as implements of their trade, and must be allowed them in cases of confiscation for debt: They may drink spirituous liquors, and eat any kind of meat except beef: Their dances are said to resemble pretty exactly those of the ancient Bacchanalians represented in some of the ancient paintings and bas reliefs. In some of their dances they attach gold and silver bells to the rings of the same metals they wear on their ankles.

¹⁵ The men generally shave their heads and beards, leaving only a pair of small whiskers and a lock on the back part of their head, which they take great care to preserve. In Kashmere and some other places, they let their beards grow to the length of two inches. They wear turbans on their heads; but the bramins who officiate in the temples commonly go with their heads uncovered, and the upper part of the body naked: round.

¹⁵ Dress of the men.

Hindoos. round their shoulder they hang the sacred string called *Zennar*, made of a kind of perennial cotton, and composed of a certain number of threads of a determined length. The *Khatris* wear also a string of this kind, but composed of fewer threads; the *Bhyfe* have one with still fewer threads, but the *Sooderas* are not allowed to wear any string. The other dress of the *bramins* consist of a piece of white cotton cloth wrapped about the loins, descending below the knee, but lower on the left than on the right side. In cold weather they sometimes put a red cap on their heads, and wrap a shawl round their bodies.—The *Khatris*, and most other of the inhabitants of this country, wear also pieces of cotton cloth wrapped round them, but which cover the upper as well as the lower part of the body. Ear-rings and bracelets are worn by the men as well as women; and they are fond of ornamenting themselves with diamonds, rubies, and other precious stones, when they can procure them. They wear slippers on their feet of fine woollen cloth or velvet, frequently embroidered with gold and silver; those of princes being sometimes adorned with precious stones. The lower classes wear sandals or slippers of coarse woollen cloth or leather. These slippers are always put off on going into any apartment, being left at the door, or given to an attendant; nevertheless the *Hindoos* make no complaints of the Europeans for not putting off their shoes when they come into their houses, which must certainly appear very uncouth to them.

Hindoo families are always governed by the eldest male, to whom great respect is shown. Filial veneration is carried to such an height among them, that a son will not sit down in the presence of his father until ordered to do so: and Mr Forster observes, that during the whole time of his residence in India, he never saw a direct instance of undutifulness to parents; and the same is related by other writers.

16
Their houses.

The houses of the *Hindoos* make a worse appearance than could be supposed from their ingenuity in other respects. In the southern parts of the country, the houses are only of one story. On each side of the door, towards the street, is a narrow gallery covered by the slope of the roof which projects over it, and which, as far as the gallery extends, is supported by pillars of brick or wood. The floor of this gallery is raised about 30 inches above the level of the street, and the porters, or bearers of palankeens, with the foot-soldiers named *Peons*, who commonly hire themselves to noblemen, often lie down in this place. This entrance leads into a court, which is also surrounded by a gallery like the former. On one side of the court is a large room, on a level with the floor of the gallery; open in front, and spread with mats and carpets covered with white cotton cloth, where the master of the house receives visits and transacts business. From this court there are entrances by very small doors to the private apartments. In the northern parts, houses of two or three stories are commonly met with. Over all the country also we meet with the ruins of palaces, which evidently show the magnificence of former times.

17
Learning of the *Bramins*.

The *bramins* of India were anciently much celebrated for their learning, though they now make a very inconsiderable figure in comparison with the Europeans. According to *Philostratus*, the *Gymnosophists* of *Ethiopia* were a colony of *bramins*, who, being obliged to

leave India on account of the murder of their king near the banks of the *Ganges*, migrated into that country. The ancient *bramins*, however, may justly be supposed to have cultivated science with much greater success than their descendants can boast of, considering the ruinous wars and revolutions to which the country has been subjected. *Metaphysics*, as well as moral and natural philosophy, appear to have been well understood among them; but at present all the *Hindoo* knowledge is confined to those whom they call *Pundits*, “doctors or learned men.” These only understand the language called *Sanscrit* or *Sanfrit*, (from two words signifying perfection); in which the ancient books were written.

The metaphysics of the *bramins* is much the same with that of some ancient Greek philosophers. They believe the human soul to be an emanation from the Deity, as light and heat from the sun. *Gowtama*, an ancient metaphysician, distinguishes two kinds of souls, the divine and vital. The former resembles the eternal spirit from which it came, is immaterial, indivisible, and without passions; the vital soul is a subtle element which pervades all things, distinct from organised matter, and which is the origin of all our desires. The external senses, according to this author, are representations of external things to the mind, by which it is furnished with materials for its various operations; but unless the mind act in conjunction with the senses, the operation is lost, as in that absence of mind which takes place in deep contemplation. He treats likewise of reason, memory, perception, and other abstract subjects. He is of opinion, that the world could not exist without a first cause; chance being nothing but the effect of an unknown cause: he is of opinion, however, that it is folly to make any conjectures concerning the beginning or duration of the world. In treating of providence, he denies any immediate interposition of the Deity; maintaining, that the Supreme Being having created the system of nature, allowed it to proceed according to the laws originally impressed upon it, and man to follow the impulse of his own desires, restrained and conducted by his reason. His doctrine concerning a future state is not different from what we have already stated as the belief of the *Hindoos* in general. According to *bishop Wilkins*, many of them believe that this world is a state of rewards and punishments as well as of probation; and that good or bad fortune are the effects of good or evil actions committed in a former state.

The science for which the *bramins*, however, were most remarkable, is that of astronomy; and in this their progress was so great, as even yet to furnish matter of admiration to the moderns.—The Europeans first became acquainted with the Indian astronomy in 1687, from a Siamese MS. containing rules for calculating the places of the sun and moon, brought home by M. Loubere the French ambassador at Siam. The principles on which the tables in this MS. were founded, however, proved to be so obscure, that it required the genius of *Cassini* to investigate them. The missionaries afterwards sent over two other sets of tables from *Hindustan*; but no attention was paid to them till M. le Gentil returned from observing the transit of *Venus* in 1769. During the time of his stay in *Hindustan*, the *bramins* had been much more familiar with him on account of his astronomical knowledge, than they usually were with

Hindoos.

Edin. Phil.
Transf.

with Europeans; and he thus had an opportunity of obtaining considerable insight into their methods of calculation. In consequence of this instruction he published tables and rules, according to the Indian method, in the academy of sciences for 1772; and in the explanation of these M. Bailly has employed a whole volume. The objects of this astronomy, according to Dr Playfair, are, 1. Tables and rules for calculating the places of the sun and moon. 2. Of the planets. 3. For determining the phases of eclipses. They divide the zodiac into 27 constellations, probably from the motion of the moon through it in 27 days; and to this lunar motion the Doctor ascribes the general division of time into weeks, which has prevailed so universally throughout the world. The days of the week were dedicated to the planets, as by the ancient heathens of the west, and in precisely the same order. The ecliptic is divided into signs, degrees, and minutes, as with us: and indeed their calculations are entirely sexagesimal, the day and night being divided into 60 hours; so that each of their hours is only 24 of our minutes, and each of their minutes 24 of our seconds.

The requisites for calculating by the Indian tables are, 1. An observation of the celestial body in some past moment of time, which is commonly called the Epoch of the tables. 2. The mean rate of the planet's motion. 3. The correction on account of the irregular motion of the body, to be added or subtracted from the mean place, according to circumstances. They calculate the places of the sun and moon, not from the time of their entrance into Aries, but into the moveable Zodiac. Thus the beginning of the year is continually advancing with regard to the seasons; and in 24,000 years will have made the complete round. The mean place of the sun for any time is deduced on the supposition that 800 years contain 292,207 days; from whence, by various calculations, the length of the year comes out only 1' 53" greater than that of De la Caille; which is more accurate than any of our ancient astronomical tables. In the equation of the sun's centre, however, they commit an error of no less than 16': but Dr Playfair is of opinion that this cannot be ascribed wholly to their inaccuracy, as there was a time when their calculation approached very near the truth; and even at present the error is less than it appears to be.

The motions of the moon are deduced from a cycle of 19 years; during which she makes nearly 235 revolutions; and which period constitutes the famous cycle supposed to have been invented by Meton the Athenian astronomer, and from him called the Metonic Cycle. They are likewise surprisingly exact in calculating the moon's apogee and some of the inequalities of her motion; they know the apparent motion of the fixed stars eastward, and the Siamese tables make it only four seconds too quick; which still shows a great accuracy of calculation, as Ptolemy the celebrated astronomer made an error of no less than 14 seconds in calculating the same thing. M. Cassini, however, informs us, that these tables are not calculated for the meridian of Siam, but for a place 18° 15' to the westward of it, which brings us very near the meridian of Benares, the ancient seat of Indian learning. This likewise agrees with what the Hindoos call their first meridian, which passes through Celon, and the banks

of the river Remananur. It must be observed, however, that the geography of the Hindoos is much more inaccurate than their astronomy.

The date of the Siamese tables is not very ancient; and that of the tables above mentioned sent from Hindostan by the missionaries is still more modern. These, however, are written in such an enigmatical manner, that the missionary who sent them was unable to tell their meaning; and Dr Playfair supposes that even the Bramins themselves were ignorant of it. Nevertheless they were decyphered by M. le Gentil; who thinks that they have the appearance of being copied from inscriptions on stone. The minutes and seconds are not ranged in vertical columns, but in rows under one another, and without any title to point out their meaning or connection.

The tables of Tirvalore are among the most remarkable of all we are yet acquainted with. Their date, according to Dr Playfair, corresponds with the year 3102 B. C. thus running up to the year of the world 902, when Adam was still in life. This era is famous in Hindostan under the name of *Calyougham*: and as this extraordinary antiquity cannot but create some suspicion, Dr Playfair has been at some pains to determine whether it is real or fictitious, *i. e.* whether it has been determined by actual observation, or derived by calculation from tables of more modern date. The result of his labours is, that we are to account the *Calyougham* as determined by observation; and that had it been otherwise, we must have been furnished with infallible methods of detecting the fallacy. His reasons for this opinion are,

1. The task would have been too difficult, even for modern astronomers, to make the necessary calculations, without taking into account the disturbances arising from the action of the heavenly bodies upon one another, and with which we cannot suppose the ancient astronomers to have been equally well acquainted with the moderns. By reason of these variations, as well as from the small errors unavoidable in every calculation, any set of astronomical tables will be found prodigiously inaccurate when applied to any period very far distant from the time of observation. Hence, says our author, "it may be established as a maxim, that if there be given a system of astronomical tables, founded on observations of an unknown date, that date may be found by taking the time when the tables represent the celestial motions most exactly."—This indeed might be done, provided we were furnished with any set of perfectly accurate tables with which we could compare the suspected ones; and Dr Playfair thinks it "a very reasonable postulatium", that our modern astronomical tables, though not perfectly accurate, are yet capable of determining the places of the celestial bodies without any sensible error for a longer period than that of the *Calyougham*.

2. By calculation from our modern tables, it appears that the place of the star *Idebaran*, at the commencement of the *Calyougham*, differs only 53' from what the Indian tables make it. He thinks this coincidence the more remarkable, as the bramins, by reason of the inaccuracy of their own date, would have erred by four or five degrees, had they calculated from their most modern tables dated in 1491.

3. At the commencement of this epoch (which, according

Hindoos.

Hindoos. cording to M. Bailly, happened at midnight between the 17th and 18th of February 3102 B. C.) the sun was in $10^{\circ} 3^{\circ} 38' 13''$ by the Indian tables. But the mean longitude of the sun, according to the tables of M. de la Caille, for the same time, comes out to be only $10^{\circ} 1^{\circ} 5' 57''$, supposing the precession of the equinoxes to have been the same at that time as now. M. de la Grange, however, has demonstrated, that, in former ages, the precession of the equinoxes was less than at present; whence there arises an equation of $1^{\circ} 45' 22''$ to be added to the sun's place already mentioned; and thus it will differ only $47'$ from the radical place in the tables of Tirvalore. Notwithstanding this reasoning, however, Dr Playfair thinks that no stress is to be laid upon this argument, as it depends on the truth of a conjecture of M. Bailly that the place of the sun above mentioned was not the mean but the true one.

4. The mean place of the moon at Benares, calculated from Mr Meyer's tables, for the 18th of February 3102 B. C. will be $10^{\circ} 0^{\circ} 51' 16''$, provided her motion had all that time been equable: but the same astronomer informs us, that the motion of the moon is subject to a small but uniform acceleration, about $9''$ in 100 years; which in an interval of 4801 years, must have amounted to $5^{\circ} 45' 44''$; which added to the preceding, gives $10^{\circ} 6^{\circ} 37'$ for the true place of the moon at the commencement of the Calyougham. Now the place of this luminary, at that time, by the tables of Tirvalore, is $10^{\circ} 6^{\circ}$; the difference is less than two thirds of a degree, which, for so remote a period, and considering the acceleration of the moon's motion, for which no allowance could be made in an Indian calculation, is a degree of accuracy that nothing but actual observation could have produced.—This conclusion is confirmed by a computation of the moon's place from all the tables to which the Indians could have any access, and of which the enormous errors would instantly show the deception. Thus, by the tables of Ptolemy, the place of the sun would be $10^{\circ} 21' 15''$ greater; and that of the moon $11^{\circ} 52' 7''$ greater than has just been found from the Indian tables. By those of Ulug Beg, the place of the sun would be $1^{\circ} 30'$, and that of the moon 6° , different from what it is by the Indian tables: and in like manner our author shows that the Indian calculations could not be derived from any other set of tables extant. In like manner, he shows that, with regard to the mean place of the moon, there is a coincidence for a period of more than 4000 years between the tables of Meyer and those of India named *Chrisnabouram*; which, though they bear a more modern date than those of Tirvalore, are thus probably more ancient. "From this remarkable coincidence (says Dr Playfair), we may conclude, with the highest probability, that at least one set of these observations on which the tables are founded, is not less ancient than the era of the Calyougham: and though the possibility of their being some ages later than that epoch is not absolutely excluded, yet it may, by strict mathematical reasoning, be inferred, that they cannot have been later than 2000 years before the Christian era.

5. Since the time that Mr Bailly wrote, every argument respecting the acceleration of the moon's motion has become more worthy of attention, and more conclusive. For that acceleration is no longer a mere

N^o 153.

empirical equation introduced to reconcile the ancient observations with the modern, nor a fact that can only be accounted for by hypothetical causes, such as the resistance of the ether, or the time necessary for the transmission of gravity; but a phenomenon which M. de la Place has with great ability deduced from the principle of universal gravitation, and shown to be necessarily connected with the changes of eccentricity in the earth's orbit discovered by M. de la Grange: so that the action of the moon is indirectly produced by the action of the planets, which alternately increasing and diminishing this eccentricity, subjects the moon to different degrees of that force by which the sun disturbs the time of her revolution round the earth. It is therefore a periodical inequality, by which the moon's motion, in the course of ages, will be as much retarded as accelerated; but its changes are so slow, that her motion has been constantly accelerated, even for a much longer period than that to which the observations of India extend.—To M. de la Grange also we are indebted for one of the most beautiful of the discoveries in physical astronomy, viz. That all the variations in our system are periodical; so that, though every thing, almost without exception, be subject to change, it will, after a certain interval, return to the same state in which it is at present, and leave no room for the introduction of disorder, or of any irregularity that might constantly increase. Many of these periods, however, are of vast duration. A great number of ages, for instance, must elapse, before the year be exactly of the same length, or the sun's equation be of the same magnitude, as at present. An astronomy, therefore, which professes to be so ancient as the Indian, ought to differ considerably from ours in many of its elements. If, indeed, these differences are irregular, they are the effects of chance, and must be accounted errors; but if they observe the laws which theory informs us they do, they must be held as the most undoubted marks of authenticity.

6. Neither these tables of Tirvalore, nor the more ancient ones of Chrisnabouram, are those of the greatest antiquity in India. The bramins constantly refer to an astronomy at Benares, which they emphatically style the *ancient*; and which, they say, is not now understood by them, though they believe it to be much more accurate than that by which they calculate.

From these and other similar arguments, Dr Playfair draws the following conclusions with respect to Indian astronomy. 1. The observations on which it is founded, were made more than 3000 years before the Christian era; and in particular, the places of the sun and moon, at the beginning of the Calyougham, were determined by actual observation. 2. Though the astronomy now in the hands of the bramins is so ancient in its origin, yet it contains many rules and tables that are of later construction. 3. The basis of their four systems of astronomical tables is evidently the same. 4. The construction of these tables implies a great knowledge of geometry, arithmetic, and even the theoretical part of astronomy. All this, however, we find controverted, or at least rendered somewhat doubtful, by William Marsden, Esq. who has written a paper on the chronology of the Hindoos in the Philosophical Transactions for 1790. "The *Kalee Yoo*g (says he), or principal chronological era, began in the year 3102 B. C. according to the common method of computation,

Hindoos.

fair, con-
cerning the
Indian a-
stronomy.

21
Controvert-
ed by Mr
Marsden.

Hindoos computation, or in 3101 according to the astronomical method, on the 18th of February, at sun-rise; or at midnight, according to different accounts, under their first meridian of *Lauka*.—At that period it is said to be asserted by their astronomers, that the sun, moon, and all the planets, were in conjunction according to their mean places. The reality of this fact, but with considerable modification, has received a respectable sanction from the writings of an ingenious and celebrated member of the French academy of sciences, who concludes that the actual observation of this rare phenomenon, by the **Hindoos** of that day, was the occasion of its establishment as an astronomical epoch. Although M. Bailly has supported this opinion with his usual powers of reasoning, and although abundant circumstances tend to prove their early skill in this science, and some parts of the mathematics connected with it; yet we are constrained to question the verity or possibility of the observation, and to conclude rather that the supposed conjunction was, at a later period, sought for as an epoch, and calculated retrospectively. That it was widely miscalculated too, is sufficiently evident from the computation which M. Bailly himself has given of the longitudes of the planets at that time, when there was a difference of no less than 73° between the places of Mercury and Venus. But fifteen days after, when the sun and moon were in opposition, and the planets far enough from the sun to be visible, he computes that all, except Venus, were comprehended within a space of 17° ; and on this he grounds his supposition of an actual observation.

“In their current transactions the inhabitants of the peninsula employ a mode of computation of a different nature, which, though not unknown in other parts of the world, is confined to these people among the **Hindoos**. This is a cycle, or revolving period, of 60 solar years, which has no farther correspondence with their other eras than that of their years respectively commencing on the same day. Those that constitute the cycle, instead of being numerically counted, are distinguished from each other by appropriate names, which in their epistles, bills, and the like, are inserted as dates, with the months, and perhaps the age of the moon annexed; but in their writings of importance and record, the year of *Salaban* (often called the *Saka* year) is superadded; and this is the more essential, as I do not find it customary to number the cycles by any progressive reckoning. In their astronomical calculations we observe, that they sometimes complete the year of their era by multiplying the number of cycles elapsed, and adding the complement of the cycle in which it commenced, as well as the years of the current cycle; but from hence we are led to no satisfactory conclusion concerning this popular mode of estimating time. The presumption is in favour of its being more ancient than their historical epochs. The present cycle, of which forty-three complete years were expired in April 1790, began in 1747, with the year of *Salaban* 1669, and of the grand era 4848. M. le Gentil, to whom Europe is chiefly indebted for what is known of **Hindoo** astronomy, has fallen into an unaccountable error with regard to the years of this cycle, and their correspondence with those of the *Kalee Yoog*, as appears by the comparative table he has given of them,

VOL. VIII. Part II.

and other passages of his work. He seems to have taken it for granted, without due examination, that the year 3600 of the latter must have been produced by the multiplication of the cycle of 60 into itself; and consequently that the first year of this grand era must likewise have been the first of the cycle. But this is totally inconsistent with the fact; the *Kalee Yoog* began the thirteenth year of the cycle of 60; and all the reasoning founded on the self-production and harmony of these periods must fall to the ground.”

From what Mr Marsden here sets forth, it is plain that we must make very considerable abatements in our confidence of the extreme antiquity of the **Hindoos** observations. Indeed we can scarce conceive a possibility of reconciling such extravagant antiquity with the authentic histories of which we are possessed, or with those of scripture. The want of an ancient history of Hindostan leaves us indeed in the dark, and gives room for ingenious and speculative men to indulge themselves in marvellous reveries concerning their antiquity. But the flood, we know, which if it existed at all, could not be but general over the whole earth*, must have destroyed every monument of art and science; and it is surely more reasonable to believe, that M. le Gentil, or the most learned man in the present age, has been mistaken (even though we should not be able to determine the particular manner), than at once to deny the authenticity of all history both sacred and profane, and attempt to evade evidence which no power of reasoning can ever set aside.

It is, however, undeniable, that the progress of the **Hindoos** in geometry as well as astronomy has been very great in ancient times. Of this a most remarkable instance is given by Dr Playfair, in their finding out the proportion of the circumference of a circle to its diameter to a great degree of accuracy. This is determined, in the *Ayeen Akbary*, to be as 3927 to 1250; and which, to do it arithmetically in the simplest manner possible, would require the inscription of a polygon 768 sides; an operation which cannot be performed without the knowledge of some very curious properties of the circle, and at least nine extractions of the square root, each as far as ten places of decimals. This proportion of 1250 to 3927 is the same with that of 1 to 3.1416; and differs very little from that of 113 to 155 discovered by Metrus. He and Vieta were the first who surpassed the accuracy of Archimedes in the solution of this problem; and it is remarkable that these two mathematicians flourished at the very time that the *Ayeen Akbary* was composed among the **Hindoos**.—In geography, however, they are much deficient; and it is very difficult to find out the true situation of the meridians mentioned by their authors from what they have said concerning them.

The art of painting among the **Hindoos** is in an imperfect state; nor are there any remains of antiquity which evince its ever being more perfect than it is just now. Their principal defect is in drawing, and they seem to be almost totally ignorant of the rules of perspective. They are much better skilled in colouring; and some of their pictures are finished with great nicety. Their sculptures are likewise rude, and greatly resemble those of the Egyptians. They seem to follow no regular rules in architecture: their temples indeed

Painting, sculpture, &c.

Hindoos.

deed are filled with innumerable columns, but most of them without any just shape or proportion. They are principally remarkable for their immense size, which gives them an air of majesty and grandeur.

24
Music.

The music of the Hindoos is but little known to Europeans; and the art seems to have made but little progress among them in comparison with what it has done in the western countries; though some of the Indian airs are said to be very melodious. Their musical instruments are very numerous: in war they use a kind of great kettle drum named *nagar*, carried by a camel, and sometimes by an elephant. The *dole* is a long narrow drum slung round the neck; and the *tam-tam* is a flat kind of drum resembling a tabor, but larger and louder. They use also the cymbal, which they name *talan*; and they have various sorts of trumpets, particularly a great one named *tary*, which emits a most doleful sound, and is always used at funerals, and sometimes to announce the death of persons of distinction.

25
Jugglers,
and en-
chanters of
serpents.† See Or-
deal.

The jugglers among the Hindoos are so expert, that many of the missionaries have ascribed their tricks to supernatural power; and even so a late traveller as Mr Grose seems to be not of a very different opinion†. Like the Egyptians, they seem to have the power of disarming serpents of their poison; and there are many strollers who go about with numbers of these animals in bags, having along with them a small bagpipe called *magouty*, which they pretend is useful to bring them from their lurking places. They take the serpents, though of the most poisonous kinds, out of the bags with their naked hands, and throw them on the ground, where they are taught to rear and move about to the sound of their music. They say that this is accomplished by means of certain incantations.

26
Antiquity
of fire-arms
among the
Hindoos.

The use of fire-arms appears to have been of great antiquity in India. They are prohibited by the code of Gentoo laws, which is certainly of a very ancient date. The phrase by which they are denominated is *agneeaster*, or weapons of fire; and there is also mention made of *shet agnee*, or the weapon that kills an hundred men at once. It is impossible to guess at the time when those weapons were invented among the Hindoos; but we are certain, that in many places of the east, which have neither been frequented by Mohammedans nor Europeans, rockets are almost universally made use of as weapons of war. The Hindoo books themselves ascribe the invention of fire-arms to *Baeshkookerma*, who formed all the weapons made use of in a war betwixt the good and evil spirits. Fireballs, or blue lights, employed in besieged places in the night-time, to observe the motions of the besiegers, are met with every where through Hindostan, and are constructed in full as great perfection as in Europe. Fireworks also are met with in great perfection; and, from the earliest ages, have constituted a principal article of amusement among the Hindoos. Gun-powder, or a composition somewhat resembling it, has been found in many other places of the east, particularly China, Pegu, and Siam; but there is reason to believe that the invention came originally from Hindostan. Poisoned weapons of all kinds are forbidden in this country.

27
Ingenuity
in various
arts.

The Hindoos are remarkable for their ingenuity in all kinds of handicraft; but their utensils are simple,

and in many respects inconvenient, so that incredible labour and patience are necessary for the accomplishment of any piece of work; and for this the Hindoos are very remarkable. Lacquering and gilding are used all over the country, and must have been used in very early ages; though in some places the lacquering is brought to much greater perfection than in others.

The principal article of food throughout all Hindostan is rice, and of consequence the cultivation of it forms the principal object of agriculture. In this the most important requisite is plenty of water; and when there happens to be a scarcity in this respect, a famine must be the consequence. To prevent this as far as possible, a vast number of tanks and water-courses are to be met with throughout the country, though in some places these are too much neglected, and gradually going to decay. After the rice is grown to a certain length, it is pulled up, and transplanted into fields of about 100 yards square, separated from each other by ridges of earth; which are daily supplied with water let in upon them from the neighbouring tanks. When the water happens to fall below the level of the channels made to receive it, it is raised by a simple machine named *picoti*, the construction of which is as follows. A piece of timber is fixed upright in the ground, and forked so as to admit another piece to move transversely in it by means of a strong pin. The transverse timber is flat on one side, and has pieces of wood across it in the manner of steps. At one end of this timber there is a large bucket, at the other a weight. A man walking down the steps throws the bucket into the well or tank; by going up, and by means of the weight, he raises it; and another person standing below empties it into a channel made to convey the water into the fields. The man who moves the machine may support himself by long bamboos that are fixed in the way of a railing from the top of the piece of upright timber towards the wall.

A number of other kinds of grain are to be met with in Hindostan, but wheat is not cultivated farther south than 18° latitude. It is imported, however, to every part of the country by the Banjaries. These are a set of people belonging to no particular cast, who live in tents, and travel in separate bodies, each of which is governed by its own particular regulations. They frequently visit towns on the sea-coast, with bullocks loaded with wheat and other articles; carrying away in exchange spices, cloths, but especially salt, which they carry into the inland parts of the country. Some of their parties have several thousands of oxen belonging to them. They are rarely molested, even in time of war, otherwise than by being sometimes pressed into the service of an army to carry baggage or provisions; but for this they are paid, and dismissed as soon as the service is over. The Hindoos themselves are prohibited from going out of the country, under the severest of all penalties, that of losing their cast. Notwithstanding this, however, it is certain that they do settle in foreign parts in the character of merchants and bankers. Perhaps these may have a toleration from the principal bramin, or there may be an exemption for people of their profession; but this is not known. At any rate, wherever they go, they appear inviolably attached to their religious ceremonies, and refuse to eat what is prohibited to them in their

Miserable
state of the
husband-
men.

their own country. The Ryots, or people who cultivate the ground, are in many places in the most miserable situation; their only food being some coarse rice and pepper, for which they are obliged to endure all the inclemencies of a burning sun, and the inconveniences which attend alternately wading in water and walking with their bare feet on the ground heated intensely by the solar rays; by which they are frequently blistered in a miserable manner. All this, however, they submit to with the utmost patience, and without making any complaint, expecting to be released from their sufferings by death; though even then their religion teaches them to hope for nothing more than what they call *absorption into the essence of the Deity*; a state almost synonymous with what we call *annihilation*.

HINDOSTAN, a celebrated and extensive country of Asia, bounded on the north by Great and Little Thibet; on the south, by the hither peninsula of India, part of the Indian Sea, and Bay of Bengal; on the west, by Persia; and on the east, by Thibet and the farther peninsula. It is situated between 84° and 102° of east longitude, and between 21° and 36° of north latitude; being in length about 1204 miles, and in breadth 960; though in some places much less.

1
Derivation
of the
names.

This country was in early times distinguished among the Greeks by the name of *India*, the most probable derivation of which is from *Hind* the Persian name. We are assured by Mr Wilkins, that no such words as *Hindoo* or *Hindustan* exist in the Sanscrit or learned language of the country; in which it is named *bharata*, a word totally unknown to Europeans. The first accounts we have of Hindostan are from Herodotus, who lived 113 years before the expedition of Alexander the Great. His accounts, however, convey very little information, as he appears only to have heard of the western part of the country, and that on account of its being tributary to Persia. He informs us, that Darius Hystaspes, about 508 B. C. had sent Scylax of Caryandra to explore the river Indus. He set sail from Caspatyrus, a town near the source of the Indus, and the territories of *Pactya* (which major Rennel supposes to be the modern *Pebkely*), and continued his course eastward to the sea; then altering his course to the west, he arrived at that place where the Phœnicians had formerly sailed round the continent of Africa; after which Darius subdued the Indians, and became master of that sea. The northern inhabitants of India, he says, resembled the Bactrians in their manners, and were more valiant than the rest; those far to the southward were as black as the Ethiopians, killed no animals, but lived chiefly upon rice; and clothed themselves with cotton. By the expedition of Alexander, the Greeks acquired a little more knowledge of the country of Hindostan, though he did little else than march over the tracts described by Herodotus. He was informed of the existence of the river Ganges, which had not been known to Herodotus; and the story of his supposing that he had discovered the source of the Nile, when near the head of the Indus, is well known, as well as his surprise and consternation when he arrived at the mouth of that river, on account of the high tides. Major Rennel is of opinion that both

3

ledge of
the Greeks
augmented
by Alex-
ander's ex-
pedition.

these stories are falsehoods. He thinks it is impossible that Alexander could have been ignorant of the writings of Herodotus, who gave an account of the discoveries of Scylax; and with regard to the other circumstance he expresses himself as follows. "The story of Alexander's surprise at seeing the tides in the Indus, appears to me equally improbable; seeing that the same Herodotus, book iii. speaks very particularly of the tides in the Red Sea, and describes them as being not only strong, but ebbing and flowing every day. (That most intelligent and ingenious traveller M. Volney informs us, that the tide ebbs and flows three feet and an half at Suez). Arrian takes no notice of the tides until Alexander's fleet had arrived near the mouth of the river. It is true, the tide in the Indus does not go up so high as in other rivers of equal bulk, and that run on so small a descent; but nevertheless, as the tide is perceptible at 50 or 60 miles above the river's mouth, we may conclude, that it could hardly escape the notice of Alexander and his people in their voyage from Pattala to the sea, supposing they had not been apprised of the circumstance. Besides, Arrian's account of the tide which did so much mischief to the fleet, is descriptive of the *bore*, or sudden influx of the tide, in a body of water elevated above the common surface of the sea; such as occurs in the Ganges, &c. He says, those ships which lay upon the sand were swept away by the fury of the tide; while those that stuck in the mud were set afloat again without any damage. To the generality of readers no reason will appear why the circumstances of the ships should be different in the mud and on the sand: the fact is, that the bottoms of channels in great rivers are muddy, while their shallows are formed of sand; and it is the nature of the bore to take the shortest cut up a river, instead of following the windings of the channel; consequently it must cross the sand-banks it meets in its way, and will also prove more destructive to whatever it meets with a ground than what is a float." For an account of the exploits of Alexander in Hindostan, see the article *MACEDON*.

The Grecian expedition into India soon excited a general curiosity in the Europeans to become acquainted with a country so wealthy and so remote. Megasthenes, the ambassador of Seleucus, resided long at Palibothra the capital of an Indian nation, and from him the ancient writers learned most of what they knew concerning that part of the world. He lived about 300 years before the Christian era, and kept a journal during the time he resided in India.

For some short time the western provinces of India continued subject to the Syrian empire founded by Seleucus; but he quickly ceded these distant countries to one Sandrocottus, who gave him only 500 elephants in exchange. Soon after this the province of Bactria likewise became independent; and thus the connection betwixt India and the western parts of the world was entirely dissolved, and we are almost entirely ignorant of the transactions of that country till the time of the Mohammedan conquest. That the extensive country we now call *Hindustan* was divided among many different nations, we have no reason to doubt; but major Rennel is of opinion, that however this might be the case, there was generally a large empire or kingdom, which

4

the Mogul
Moham-
medans.

Hindostan. occupied the principal part of that immense valley through which the Ganges takes its course; the capital of which has fluctuated between Dehli and Patna, as the limits of the empire have varied. This was named the kingdom of the *Prasij* or *Gangarida* in the times of Alexander and Megasthenes. Major Rennel is of opinion that it extended westward to the Panjab country; and he also thinks it probable that the capital named *Palibothra* stood on the same spot which is now occupied by the city of Patna. The kingdom, according to this supposition, would occupy part of Bengal; and he thinks that it could not be less than that of France. It was on the borders of this kingdom that Alexander's army mutinied and refused to proceed any farther. Arrian informs us, that the people were rich, excellent soldiers, and good husbandmen; that they were governed by nobility, and that their rulers imposed nothing harsh upon them.

3
No ancient
Hindoo hi-
story to be
credited.

The Hindoos themselves pretend to an extravagant antiquity; but we are informed by major Rennel, that "there is no known history of Hindostan (that rests on the foundation of Hindoo materials or records) extant before the period of the Mohammedan conquests; for either the Hindoos kept no regular histories, or they were all destroyed, or secluded from common eyes by the Pundits. We may judge of their traditions by that existing concerning Alexander's expedition; which is, that he fought a great battle with the emperor of Hindostan near Delhi, and though victorious, retired to Persia across the northern mountains; so that the remarkable circumstance of his sailing down the Indus, in which he employed many months, is sunk altogether. And yet, perhaps, few events of ancient times rest on better foundations than this part of the history of Alexander, as appears by its being so highly celebrated, not only by cotemporaries, but by several of the most eminent authors for some centuries following. The only traces of Indian history we meet with are in the Persian historians. In the beginning of the 17th century, Mohammed Ferishta composed an history of Hindostan, most of which was given in that of colonel Dow, published upwards of 30 years ago; but with regard to the early part of it, major Rennel is of opinion that it cannot at all be depended upon.

6
Expeditions
of Mah-
mud Gazni
into India.

The authentic history of Hindostan commences with the conquests of Mahmud or Mahmood Gazni, about the year 1000. His kingdom had arisen out of that of the Saracens, who under the khaliff Al Walid had extended their conquests immensely both to the east and west. Mahmud was the third from Abistagi a governor of Khorasan, who had revolted from the king of Backharia. He possessed great part of that country formerly known by the name of *Bactria*. Gazni, or Ghizni, was the capital; a city which stood near the source of the Indus, though Balkh likewise claimed this honour. Subuctagi, the father of Mahmud, had projected the conquest of the western part of India; but dying before he could put his designs in execution, Mahmud took upon himself the conduct of the expedition; but previous to his invasion of India, he strengthened himself by the conquest of the whole of the ancient *Bactria*. His first invasion took place in the year 1000; during which he made no farther progress than the province of Moulton. That part of the country was inhabited by the Kuttry and

Rajpoot tribe, the Malli and Catheri of Alexander, Hindostan who still retained their ancient spirit, and made a very stout resistance to the armies of that furious enthusiast. As he was prompted to this undertaking no less by a desire of exterminating the Hindoo religion than by that of conquest, a league was at last formed against him among all the Indian princes from the banks of the Ganges to the Nerbudda. Their allied forces, however, were defeated, and the year 1008 was marked by the destruction of the famous temple of Nagracut in the Panjab country. Having satiated himself with plunder on this occasion, Mahmud returned to his own country; but in 1011 invaded Hindostan once more, destroying Tanafar a city on the west of Delhi, and a more celebrated place of worship than Nagracut itself. Delhi was reduced on this occasion; and in seven years after Canoge was taken; the temples of Matra or Methura, the Methora of Pliny, a city of great antiquity, and remarkable for a place of worship near Agra, were likewise demolished; but he failed in his attempts on the Rajpoots of Agimere, either through their own valour or the strength of their country. His 12th expedition took place in the year 1024, when he destroyed the celebrated temple of Sumnaut in the peninsula of Guzerat, adjoining to the city of Puttan on the sea-coast, and not far from the island of Diu, now in the hands of the Portuguese. In this expedition he proved very successful, reducing the whole peninsula of Guzerat, with many cities, the temples of which he constantly destroyed; and indeed seemed no less pleased with the overthrow of the Hindoo religion than with the conquest of the country. At his death, which happened in 1028, he was possessed of the eastern and by far the largest part of Persia, and nominally of all the provinces from the western part of the Ganges to the peninsula of Guzerat; as well as those lying between the Indus and the mountains of Agimere; but the Rajpoots in that country still preserved their independency, which they have done all along, even to the present time.

In the year 1158 the empire of Gazna fell to pieces. Division of from the same causes by which other large and un- the empire- wieldy states have been destroyed. The western and of Gazna, largest part, which still retained the name of Gazna, and various conquests was seized upon by the family of Gaurides, so na- in Hindo- med from Gaur or Ghor, a province beyond the In- stan by dis- dian Caucasus; while those contiguous to both shores ferent ad- of the Indus were allowed to remain in the possession venturers of Chusero or Cusroe, whose capital was fixed at Lahore. In 1184 the posterity of this prince were driven out of their territories by the Gaurides; by which means the Mohammedans became neighbours to the Hindoos, and in a short time began to extend their dominions to the eastward. In 1194 Mohammed Gori penetrated into Hindostan as far as Benares, and repeated the same scenes of devastation which had formerly taken place under Mahmud Gazni. At this period major Rennel is of opinion, that the purity of the language of Hindostan began to decline, and continued to do so till it became what it is at present; the original dialect being what is called the Sanscrit, and which is now a dead language. Mohammed Gori also reduced the southern part of the province of Agimere, and the territory to the south of the river Jumna, taking possession of the strong fortress of Gualior. After

Hindostan After his death in 1205, the empire of Gazna was again divided; and the Patan or Alghan empire was founded by Cuttub, who had the Indian part, the Persian remaining to Eldoze. Cuttub fixed his imperial residence at Delhi; and in 1210 the greatest part of Hindostan Proper was conquered by the emperor Altumish, the successor of Cuttub. After his time the government of Bengal was always bestowed upon one of the reigning emperor's sons; and during his reign the bloody conqueror Jenghiz Khan put an end to the other branch of the Gaznian empire, known by the name of *Kbarasm*; of which revolution an account is given under the article *GAZNA*; but Hindostan was at that time left undisturbed. In 1242 the Moguls began to make irruptions into Indostan, but did not at this time make any permanent conquest. The country was now in much the same state in which it had been before the invasion of the Mahommedans, viz. divided into a great number of states tributary to the emperor, but in a great measure independent; and which did not fail to revolt whenever a favourable opportunity offered. The kingdom of Malwa, which had been reduced by Cuttub in 1205, shook off the yoke in the year 1265, and the Rajpoots were on every occasion ready to revolt, notwithstanding that their country lay in the neighbourhood of the capital. The most dreadful massacres, rebellions, and confusion, now took place, which from that period almost to the time that the British government commenced, make up the history of Hindostan. The empire being parcelled out among a set of rapacious governors, the people were reduced to the last degree of misery, and were at last so far misled as to imagine that it was their interest to take up arms, in order to render these governors independent. Had the emperors of Hindostan consulted their true interest, they would have given up the provinces which lay beyond the upper part of the Indus and the deserts of Agimere; as these formed a barrier which could not easily be passed by any invader. By neglecting this precaution, however, they at last gave an opportunity to the Moguls to penetrate into their country; and these, after several invasions, became at last so formidable, that they were permitted by the emperors, in the year 1292, to settle in the country. At this time the reigning emperor was Feroze II. of the tribe of *Chilligi* or *Killigi*, so named from Killige near the mountains of Gaur; and in 1293 this emperor projected the conquest of the Deccan; by which was meant at that time all the territory lying to the southward of the Nerbudda and Mahanada and Catta-

The country of Deccan conquered.

Cheitore, two of the strongest forts in the Rajpoot Hindostan country. In 1303 the city of Warangole, capital of a kingdom of the Deccan, named Tellingana, was reduced; but in the midst of these conquests the Moguls invaded the country from an opposite quarter, and plundered the suburbs of Delhi. Notwithstanding this check the emperor resumed his plan of conquest; the remainder of Malwa was subdued; and in 1306 the conquest of the Deccan was again undertaken. The conduct of the war was now committed to Cafoor; who not only carried his army into Dowlatabad, but, in 1310, penetrated into the Carnatic also. The extent of his conquests in that country is not known; and indeed his expeditions seem to have been made with a view rather to plunder than to achieve any permanent conquest. The quantity of riches he amassed was so great, that the soldiers are said to have carried away only the gold, leaving silver behind them as too cumbersome. As the treasure carried off on this occasion had been accumulating for a number of ages, it is probable that the country had long remained in a state of tranquillity. Cafoor still proceeding in his conquests, ravaged a second time the northern part of the Deccan, and obliged the inhabitants of Tellingana and the Carnatic to become tributary to him. Rebellions took place in 1322; but the country was again reduced in 1326, and the whole Carnatic ravaged from one sea to the other. This year Alla died, and his successors, not being possessed of his abilities, were unable to retain the dominions he had left. Under the emperor Mohammed III. the people of the Deccan again revolted, and drove the Mahommedans so completely out of these countries, that nothing remained to them but the fortrefs of Dowlatabad. In 1344 the city of Bijnagar, properly *Bijnagur*, was founded by Belaldeo the king of Deccan, who had headed the inhabitants in their late revolt. Mohammed in the mean time attempted to extend his dominions towards the east; but while he employed himself in this, many provinces were lost by rebellions in Bengal, Guzerat, and the Panjab. His successor Feroze III. who ascended the throne in 1351, seemed more desirous of improving the remains of his empire than of extending it; and, during his reign, which continued for 37 years, agriculture and the arts were the favourite objects of his pursuit. After his death, in 1388, a rebellion and civil war took place, and continued for several years; and matters were brought to a crisis in the time of Mahmud III. who succeeded to the throne in 1393; and, during this time, the empire of Hindostan exhibited the singular circumstance of two emperors residing in the same capital, and in arms against each other. While matters remained in this situation, Tamerlane, after having subdued all the western part of Tartary and Asia, turned his arms against Hindostan in the year 1398. His conquest was easy, and his behaviour such as rendered him worthy of the name by which he is yet known in Hindostan, "the destroying prince." After having brought into captivity a vast number of the poor inhabitants, he caused a general massacre to be commenced lest they should join the enemy in case of any sudden emergency; and in consequence of this cruel order, upwards of 100,000 were put to death in one hour. In the beginning of the year 1399 he was met by the Indian army, whom he defeated with great slaughter.

Revolts and confusion throughout the whole empire.

Conquests and massacres of Tamerlane.

Hind. stan.

slaughter, and soon after made himself master of the imperial city of Delhi. At this time the capital consisted of three cities, named *Old Delhi*, *Seyri*, and *Jehan Penab*. *Seyri* was surrounded with a wall in the form of a circle; and *Old Delhi* was the same, but much larger, lying to the southwest of the other. These two were joined on each side by a wall; and the third, which was larger than the other two, lay between them. As the city made no resistance, there could not be a pretence for using the inhabitants with any cruelty; and thus matters passed on quietly till the 12th of January, when the Tartar soldiers insulted some of the inhabitants at one of the gates. The Emirs were ordered to put a stop to these disorders, but found it impossible. The Sultanas, having a curiosity to see the rarities of Delhi, and particularly a famous palace adorned with 1000 pillars built by an ancient Indian king, went in with all the court; and the gate being thus left open for every body, above 15,000 soldiers got in unperceived. But there was a far larger number of troops in a place between the cities above mentioned, who committed such disorders, that an insurrection commenced; some of the inhabitants attacking them, while others, in despair, set fire to their houses, and burnt themselves with their wives and children. The soldiers, taking advantage of this confusion, pillaged the houses; while the disorder was augmented by the admission of more troops, who seized the inhabitants of the neighbouring cities that had fled to Delhi for shelter. The Emirs caused the gates to be shut; but they were quickly opened by the soldiers, who rose in arms against their officers; so that, by the morning of the next day, the whole army was entered, and the city totally destroyed. Some soldiers carried off no fewer than 150 slaves, men, women, and children; nay, some of their boys had 20 slaves a-piece to their share. The other spoils in jewels, plate, and manufactures, were immense: for the Indian women and girls were all adorned with precious stones, and had bracelets and rings on their hands, feet, and even toes, so that the soldiers were loaded with them. On the 15th the Indians attempted to defend themselves in the great mosque of *Old Delhi*; but being attacked by the Tartars, they were all slaughtered, and towers erected. A dreadful carnage now ensued throughout the whole city, though several days elapsed before the inhabitants could be forced to quit it entirely; and as they went, the Emirs took many of them into their service. The artisans were also distributed among the princes and commanders, all but the masons, who were reserved for the emperor, in order to build him a large stone mosque at Samarcand.

After this terrible devastation, Tamerlane marched into the different provinces of *Indostan*, every where defeating the Indians who opposed him, and slaughtering the Ghebrs or worshippers of fire. On the 25th of March he retired, and thus set the miserable inhabitants free from the most bloody conqueror that had ever invaded them. He did not, however, disturb the succession to the throne, but left Mahmud in quiet possession of it, reserving to himself only that of the *Panjab* country. The death of Mahmud, which happened in 1413, put an end to what is called the *Patan* dynasty, founded by *Cuttub* in 1205. He was succeeded by *Chizer*, who derived his pedigree from the im-

Hindostan.

postor Mohammed, and his posterity continued to enjoy it till the year 1450; when *Belloli*, an Alghan of the tribe of *Lodi*, took possession of it, the reigning prince *Alla II.* having abdicated the government. Under him all *Hindostan* was divided into separate states; and a prince, whose title was the *king of the East*, who resided at *Jionpour* in the province of *Allahabad*, became so formidable, that the king of *Delhi* had only a shadow of authority remaining to him. A considerable part of the empire, however, was recovered by the son of *Belloli*; who, in the year 1501, fixed his royal residence at *Agra*. During his reign the Portuguese first accomplished the passage to India by the *Cape of Good Hope*, but they had no connection with any other part of *Hindostan* than some maritime places in the *Deccan* which had always been independent of the court of *Delhi*. In 1516, during the reign of *Ibrahim II.* matters fell into such confusion that *Sultan Baber*, a descendant of *Tamerlane*, found means to conquer a very considerable part of the empire. His first expedition took place in the year 1518; and the year 1525 made himself master of *Delhi*. In his last invasion he is said to have brought with him only 10,000 horse; having been furnished with the rest by the disaffected subjects of the emperor. During the five years that he reigned, his chief employment was the reduction of some of the eastern provinces, but had not time to compose the disturbances which took place throughout the whole of his dominions. On his death the seeds of rebellion, which *Baber* had not been able to exterminate, produced so many revolts and insurrections, that his son *Humaioon*, though a prince of great abilities and virtue, was driven from the throne, and obliged to take shelter among the *Rajpoot* princes of *Agimere*, where he lived in great distress. During the time of his exile his son *Ackbar* was born, whom *Mr Rennel* looks upon to be one of the greatest princes that ever sat on the throne of *Hindostan*. The sovereignty was held in the meantime by an usurper, named *Sheerkhan*, who in 1545 was killed at the siege of *Cheitore*, and buried in a magnificent mausoleum, of which *Mr Hodges* lately exhibited a drawing in this country. His territories, at the time of his death, extended from the *Indus* to *Bengal*; but so unsettled was the government, that after his decease no fewer than five sovereigns appeared in the space of nine years. This induced a strong party in *Hindostan* to recal *Humaioon*; but he lived only one year after his return.

In 1555, *Humaioon* was succeeded by his son *Ackbar*, at that time only 14 years of age. During his long reign of 51 years, he established the empire on a more sure foundation than it had probably ever been before; though even at this time *Mr Rennel* is of opinion, that all the tranquillity enjoyed by the people was merely that there was no actual rebellion. The first years of his reign were spent in reducing the provinces which had revolted from *Agimere* to *Bengal*; and the obedience of these he took care to secure as well as possible by a careful choice of governors; particularly by an unlimited toleration in religious matters, and an attention to the rights and privileges of the people. In 1585, he resolved to invade the *Deccan*, which had hitherto resisted the power of the *Mogul* princes. The war continued for 20 years; during all which time no farther

12
Reign of
Ackbar, a
great
prince.

¹³ **Bad conduct of his successors.** Hindostan. farther progress was made than the reduction of the western part of Berar, Candesh, Tellingana (a division of Golconda), and the northern part of Amednagar; the capital of which, named also *Amednagar*, was taken in 1601, after a long and bloody siege, and an unsuccessful attempt of the princes of the Deccan to relieve it. Under his successor Jehan Guire, the project was but faintly carried on; the empire was disturbed by the rebellion of Shah Jehan the emperor's son; and the influence of Noor Jehan his mistress perplexed the councils of the nation. In this prince's reign Sir Thomas Roe, the first English ambassador, arrived at the court of Hindostan. The Portuguese had now acquired considerable possessions in Guzarat and Bengal, but only those in the former province attracted the attention of the court; so that the Persian historian takes no notice of those in Bengal. In the reign of Shah Jehan, who succeeded his father Jehan Guire in 1627, the conquest of the Deccan was more vigorously pushed than before; and the war was carried on in such a destructive manner, that most of the princes in those parts were fain to make submission to the emperor. During this reign a war took place with the Portuguese, which ended in the expulsion of the latter from Hoogly on the Ganges. In his private character Shah Jehan was a very debauched and wicked prince, which gave occasion to one of his sons named *Aureng-zib* or *Aureng-zebe*, to dethrone him. ¹⁴ **The empire raised to its greatest height by Aureng-zebe.** This prince attained his end by a train of deep hypocrisy and dissimulation; covering his ambition with a pretence of religion, and under that pretence committing the greatest crimes. He engaged in a war with two of his brothers, both of whom he defeated by unforeseen accidents, when he himself seemed to be on the brink of destruction. Having at last got them into his power, he put them both to death, and then lamented their misfortune. One of his brothers who assisted him, was rewarded first with imprisonment, and then with death. By the year 1660, he had attained full possession of the sovereignty, and from that time to the year 1678 there reigned a profound tranquillity throughout the whole empire. In the latter part of his reign he undertook the conquest of the Deccan, to which he was supposed to be incited by the resolution and growing power of Sevagee, the founder of the Mahratta state; and who, in that character, appeared almost as a rival to Aurengzebe himself. Having quelled a rebellion of the Patans, who lived beyond the Indus, he persecuted the Hindoos to such a degree, that the Rajpoot tribes in Agimere commenced a war against him. On this occasion he headed his armies also in person; but having the misfortune to be hemmed in among the mountains, he would certainly have been taken prisoner, had not the enemy thought proper to allow him to escape. They allowed also the empress to make her escape after she had been actually taken. In 1681 he renewed his incursions into that country, took and destroyed Cheture, committing other devastations, and every where destroying the Hindoo temples and objects of worship; but notwithstanding all his efforts, he was at last obliged to abandon his enterprise, and allow them to remain in peace. From the year 1678 to the time of his death in 1707, he is said to have been chiefly employed in the Deccan, the greatest part of which he reduced, and for the last

five years of his life is said to have been actually employed in the field. This long absence from his capital could not but be productive of bad consequences. Rebellions broke out in various parts of the empire; and during this period, the Jats or Jauts first made their appearance in the province of Agra. They were at first only a set of banditti; but have since grown to be a very considerable state, and once were of some consequence in Upper Hindostan. After the 10th year of Aurengzebe's reign, however, we know very little of his transactions, as he would not allow any history of it to be written. At the time of his death the empire extended from the 10th to the 35th degree of latitude, and almost as many degrees in longitude. "His revenue (says Major Rennel) exceeded 35 millions of pounds Sterling, in a country where the products of the earth are about four times as cheap as in England. But so weighty a sceptre could be wielded only by a hand like Aurengzebe's: and we accordingly find, that in a course of 50 years after his death, a succession of weak princes and wicked ministers reduced this astonishing empire to nothing."

Aurengzebe left four sons; Mausum, afterwards emperor, under the title of Bahader Shah; Azem, Kaum Bush, and Acbar, who had been obliged to fly to Persia 30 years before on account of his having engaged in rebellion against his father. A civil war instantly commenced between Azem and Mausum; the event of which was decided in a great battle, where 300,000 combatants were brought into the field on each side. In this battle Azem was defeated and killed; after which Mausum ascended the throne by the title of Bahader Shah. He was a prince of considerable abilities; but the disorders of the empire were already risen to such an height, that during his short reign of five years, he found it impossible to compose them. He was first engaged in war with his brother Kaum Bush, whom he also defeated and killed; after which his attention was engaged by the Seiks, a new set of religionists, who, during the reign of Shah Jehan, had silently established themselves along the foot of the eastern mountains. They now appeared in arms in the province of Lahora, and ravaged the whole country from thence to the banks of the Jumna. The emperor marched against these adversaries in person, and with great difficulty brought them under subjection. He then took up his residence at Lahore, where he died after a short illness, without having ever visited the imperial cities of Agra or Delhi. ¹⁵ **Its quick decline under his successors.**

After the death of Bahader Shah the empire was again contested among his four sons. Of these the second, named Azem Ooshaun, took possession of the treasures; but was opposed by his three brothers, who agreed to divide the empire among them. Azem was defeated and killed in a battle, gained chiefly by the valour and conduct of the youngest named *Shah Jehan*; who seemed resolved to abide by the agreement, and as a proof of his sincerity, ordered the treasures to be divided. This was prevented by the intrigues of Zoolfecar khan, an omrah in high trust. A new civil war commenced, in which Jehan Shah was killed. The two remaining brothers tried their fortune in a third battle, which left Jehaunder, the eldest, in possession of the throne. In nine months he was dethroned by Ferakfere,

¹⁵ Hindostan. rakfere, or Furrokfere, son to the deceased Azem Ooshaun; having, during his short reign, displayed almost unparalleled meanness of spirit.

¹⁶ Firman granted to the East India company. This revolution was accomplished by the assistance of two brothers, Houssein Ali Khan and Abdoolah Khan, who had extensive governments in the eastern provinces. The calamities of the empire were not at all abated during this reign. In 1713 the Seiks appeared again in arms; and in 1716 were grown so formidable, that the emperor himself was obliged to march against them; but we are totally ignorant of the particulars of this campaign. About this time the English East India company obtained the famous *Firman* or grant, by which their goods of export and import were exempted from duties or customs; which was regarded as the company's commercial charter in India, while they stood in need of protection from the princes of that country.

Ferokfere was deposed, and his eyes put out by the two brothers who had raised him to the throne; and in the course of the same year two other emperors, whom they afterwards set up, were deposed and murdered: and thus, in eleven years after the death of Aurengzebe, 11 princes of his line, who had either mounted the throne or been competitors for it, were exterminated, while the government declined with such rapidity, that the empire seemed ready to be dismembered to a greater degree than it had even been before the invasion of Tamerlane. In 1718 the two brothers raised to the throne Mohammed Shah, the grandson of Bahader Shah; but this prince having got sufficient warning by the fate of his predecessors, took care to rid himself of these powerful subjects, though this could not be accomplished without a civil war. New enemies, however, started up. Nizam-al-Muluk, viceroy of the Deccan, had been for some time augmenting his power by every possible method, and was evidently aspiring at independence. Having received some affronts from the two brothers, who for some time had ruled every thing with an absolute sway, he thought proper to retire to his government. In 1722 he was invited to court, and offered the place of vizier or prime minister, but declined accepting it, while the growing and formidable power of the Mahrattas furnished him with a pretence for augmenting his army. At last, having by the year 1738 attained a sufficient degree of strength to accomplish his purposes, and confident of his having a large party at court, he came thither attended by a great body of armed followers. Finding, however, that the interest of the emperor was still too powerful for him, he invited the celebrated Persian usurper Nadir Shah, commonly known by the name of *Khouli Khan*, to invade Hindostan. The invitation was accepted, and Nadir entered the country without opposition. The imperial general Douran being killed in a skirmish, no decisive engagement took place; and the Persian chief, though far advanced into Hindostan, yet looked upon matters to be so uncertain, that he offered to evacuate the country and retire for 50 lacks of rupees, about half a million sterling. The intrigues of the Nizam and his party hindered the emperor from complying with this moderate demand; instead of which he absurdly threw himself upon the usurper's mercy, who then took possession of Delhi, demanding

N^o 154.

a ransom of 30 millions sterling. At an interview with the emperor, he severely reprimanded him for his misconduct; however he told him, that as he was of the race of Timur (Tamerlane), who had not offended the reigning family of Persia, he would not take the empire from him; only as he had put him to the trouble of coming so far to settle his affairs, he insisted that his expences should be paid. The unfortunate emperor made no answer to this speech; but Nadir took care to enforce the latter part of it. Some time after the departure of the emperor, Nadir went to the camp to pay him a visit; where he seized upon 200 cannon, with some treasure and valuable effects, sending them off immediately to Candahar. He then marched back to Delhi, where a mob arose about the price of corn. As Nadir Shah was endeavouring to quell it, a musket was designedly fired at him, by which he narrowly escaped being killed. Exasperated at this, he commanded an indiscriminate massacre to be made, which his cruel soldiers instantly put in execution with the greatest alacrity, and 120,000, or, according to others, 150,000, of the miserable inhabitants were slaughtered without mercy. This was followed by a seizure of all the jewels, plate, and valuable articles which could be found, besides the exaction of the 30 millions, which was done with the utmost rigour; insomuch that many of the inhabitants chose rather to put an end to their own lives than to bear the torments to which they were subjected in case of inability to pay the sum imposed upon them. During these horrid scenes, Nadir caused the marriage of his son to be celebrated with a grand daughter of Aurengzebe; and after having extorted every thing which he demanded, at last took leave of the emperor with every mark of friendship. He put the crown upon his head with his own hands; and after having given him some salutary advice relative to the government of his empire, he set out from Delhi on the 6th of May 1739.

¹⁸ Inhabitants of Delhi slaughtered. By this invasion the empire sustained prodigious loss. Since the arrival of Nadir in Hindostan, about 200,000 people had been destroyed, and goods and treasure carried off to the amount of 125 millions sterling. Mohammed had ceded to the usurper all the provinces of Hindostan situated to the west of the Indus. His departure left the Nizam in possession of all the remaining power in the empire, which he instantly made use of to establish himself in the sovereignty of the Deccan. The province of Bengal had already become independent under Aliverdy Cawn, in the year 1738; and not long after, it was invaded by a vast army of Mahrattas under sanction of the emperor's name; who being unable to satisfy them in the arrears of tribute he had been obliged to consent to pay, sent them into Bengal to collect for themselves. About the same time, the Rohillas, a tribe from the mountains which lie between India and Persia, erected an independent state on the east of the Ganges, within 80 miles of Delhi.

¹⁹ Miserable state of Hindostan after his departure. The total dissolution of the empire seemed now to be fast approaching. In the confusion which took place after the murder of Nadir Shah, Abdallah, one of his generals, seized upon the eastern part of Persia, and the adjoining provinces of India, which had been ceded to Nadir by Mohammed Shah; which he formed into a kingdom still known by the name of *Candahar*.

¹⁷ Invasion of Nadir Shah.

Hindoostan. *har* or *Abdalli*; of which a more particular account is given in the subsequent part of this article.

This year Mohammed Shah died, after a reign of 29 years; which, considering the fate of his immediate predecessors, and the anarchy universally prevalent throughout Hindoostan, must be accounted very wonderful. He was succeeded by his son Ahmed Shah; during whose reign, which lasted about six years, the total division of the remainder of the empire took place. Nothing now remained to the family of Tamerlane but a small tract of territory round the city of Delhi, now no longer a capital, and exposed to the repeated depredations of invaders, with consequent massacres and famines. The last army which could with propriety be termed *imperial*, was defeated by the Rohillas in 1749; by which their independence was fully established in the eastern parts of the province of Delhi. The Jauts, or Jats, a Hindoo tribe, established themselves in the province of Agra; the Deccan and Bengal were seized upon by their viceroys, Nizam and Aliverdy. Oude was seized on by Seifdar Jang (father to the late Sujah Dowlah); Allahabad by Mohammed Kooli. Maliva was divided between the Poonah Mahrattas and several native princes and Zemindars: Agimere reverted of course to its ancient lords, the Rajpoot princes; and the Mahrattas, in addition to their proper share of Maliva, possessed the greatest part of Guzerat, Berar, and Orissa; besides their ancient dominions in the Deccan. These people were now become so powerful, that they were alternately courted and employed by the contending parties, like the Swiss in Europe; with this difference, that the Swiss are paid by those who employ them, whereas the Mahrattas always take care to pay themselves. Abdalla having established his empire in the manner above related, entered Lahore and Moulton, or the Panjab, with a view to conquest. "The whole country of Hindoostan was in commotion (says Major Rennel) from one entrance to the other, each party fearing the machinations or attacks of the other; so that all regular government was at an end, and villany was practised in every form. Perhaps in the annals of the world it has seldom happened that the bonds of government were so suddenly dissolved, over a portion of country containing at least 60 millions of inhabitants."

20
First interference of the French and English in the affairs of Hindoostan.

In 1748 the Nizam died at the age of 104, and was succeeded by his son Nazirjung, to the prejudice of his eldest brother Gazi, vizier to the nominal emperor. The contests that followed on this occasion for the throne of the Deccan, and nabobship of Arcot, first engaged the French and English as auxiliaries on opposite sides. This was followed by a long series of hostilities, which terminated in the total expulsion of the French from Hindoostan, the entire humiliation of the Mogul, and his being reduced to the state of a mere tool of the English East India company; together with the subjection of a vast tract of country to the latter. These transactions have occasioned very considerable revolutions, not only in the country properly called *Hindoostan*, but in other places of that extensive tract called the *East Indies*: for some account of which see the article INDIA.

21
Different powers among which Hindoostan is divided.

The vast country of Hindoostan is at present divided among the following powers.

1. Timur Shah, son of Ahmed Shah, or Abdallah,

VOL. VIII. Part II.

Hindoostan. possesses an extent of territory to the north-westward before we come to the river Indus. This country, extending all the way betwixt India and Persia, is known by the name of *Duran*, or *Turan*; and was possessed by the Afghans, of whom Abdallah became the sovereign. He was descended from an illustrious family; and having the misfortune of being taken prisoner by Hussein Khan, then chief of Kandahar, along with his brother Zulfecur Khan, they were released by the celebrated Nadir Shah in his passage through that country to Hindoostan; but as that conqueror still looked upon them with a jealous eye on account of their great influence with their countrymen, both were sent to Mazandaran in Persia. Here Zulfecur Khan, the brother of Ahmed, died; and, some time after, we find the latter promoted to the command of a body of Afghan cavalry in the Persian army. He continued attached to the interests of Nadir while that conqueror lived; and even attempted, though ineffectually, to revenge his death. Proving unsuccessful in this attempt, he returned to his own country; and, arriving at Kandahar, was saluted chief of the Afghans. In the course of a few months he became master of all the countries which the Mogul had been obliged to cede to Nadir Shah; and, encouraged by the distracted state of the affairs of Hindoostan at that time, he crossed the Indus, and plundered the country to the south-east. An indecisive battle fought with the Indian army under the command of the prince royal and vizier, in which the latter was killed, obliged Ahmed to return to his own territories; but he soon undertook another expedition, in which he conquered the province of Lahore. In 1755 he returned; and after staying some time at Lahore, marched to Delhi the capital, having been invited thither, as was supposed, by the Mogul himself, in order to get rid of the tyranny of his vizier. The latter was accordingly deserted in a battle by orders of the emperor, and obliged to surrender himself prisoner: but instead of being put to death, he had the address to ingratiate himself with the conqueror; and the unfortunate Allumghire, the Mogul, was obliged to submit to be ruled by him as before. Ahmed took care to indemnify himself for his trouble, by laying the city of Delhi under a heavy contribution; and having staid for about a month, during which time he concluded a marriage betwixt his son Timur and the emperor's niece, he marched against a tribe of Hindoos named the *Jauts*, and conquered the greatest part of the province of Agra. In this expedition he surprised the city of Matra, famous for being the birth-place of *Krishen*, the Apollo of the Hindoos; and sacrificed to the *Gopia*, the muses of the country. He failed in his attempt to surprise Agra through the resolution of Fazil Cawn the governor; after which he led back his troops to Delhi, where he married the daughter of Mohammed Shah the late emperor, whom Allumghire had in vain solicited for himself.

Having settled his son Timur in the government of Lahore, Ahmed quitted Hindoostan, and returned to his dominions, where he found every thing in confusion. Timur, who during his father's absence had been frequently disturbed by the Seiks, a tribe of Hindoos who profess deism, was in 1760 driven out by a vast army of Mahrattas commanded by Roganaut Row

Hindoostan. the Paishwa's brother, of whom so much mention has already been made. Next year, however, Ahmed crossed the Indus, and easily recovered his former territories; soon after which he became head of a league formed among some of the Indian princes, in order to oppose the overgrown power of the Mahrattas. In this enterprise he proved successful; and overthrew the Mahrattas in a decisive and very bloody battle, in which more than 50,000 of them were killed on the spot. The pursuit lasted several days, and their vast army was totally dispersed; Ahmed being every where received with acclamations as the deliverer of the faithful. In 1762 he again crossed the Indus, with a view to conquer, or rather to exterminate, the Seiks, whose incursions had become very troublesome, and even dangerous, to his kingdom. Having defeated their army, and forced them to take refuge in the woods and strong holds, he set a price on the heads of all those who professed their tenets; and that with such success, that heaps of them are said to have been piled up in all the principal towns in these parts. At last, hearing that they had assembled in great numbers to celebrate an annual festival, he marched with an army to surprise them. The Seiks, however, were well provided for his reception, and an obstinate battle ensued. During the time of the engagement an eclipse of the sun happened, which, though disregarded by the Seiks, greatly dismayed the superstitious Mohammedans. Ahmed was therefore defeated; and though he frequently returned, was never able thoroughly to subdue that people. At last, having been long afflicted with an ulcer in his face, he died on the 15th of July 1773, at a place named *Kohtoba*, among the mountains of Kandahar, to which he had retired for the sake of coolness, and was succeeded by his son Timur, who still continues to enjoy the sovereignty. The dominions of this prince extend a very considerable way to the northward of the Indus, but he possesses nothing in *Hindoostan* besides the province of *Kashmire*.

2. The Seiks inhabit a country on the other side of the Indus, and making part of *Hindoostan* properly so called. They derive their origin from a Hindoo named *Nanuck* of the cast of *Khatry*. His father, named *Baba Caloo*, possessed a small district in the province of *Lahore* named *Telvandi*, where *Nanuck* was born in the year 1470. Like other founders of new sects or nations, he is said during his infancy to have given many indications of his future superiority to the rest of mankind. He seems, however, to have received no farther education than what was common to young men of his cast; viz. reading, writing, and arithmetic, and hearing the *fastras* or commentaries on the sacred books. In his early youth he was married to a woman of his own cast, by whom he had two sons. Being a convert to the worship of the Invisible, or deism, he accustomed himself to declaim against the folly of worshipping idols, and the impiety of paying adoration to any but the supreme Being. At the age of 25 he left his family to visit *Bengal* and the eastern parts of *Hindoostan*; in a second journey he visited the south, and in a third he went as far as *Persia* and *Arabia*. On his return from this last journey, he expressed a desire of remaining in his native country; and was furnished, according to his wish, with a piece of ground on the

banks of the river *Bavy*, about 80 miles north eastward from the city of *Lahore*. Here he took up his residence for the rest of his days; and choosing to be free from the cares of this world, he dwelt at a distance from his wife and children, who came occasionally to visit him. Having acquired great reputation for his piety, wisdom, and learning, he died at the age of 70; and since his death the place of his abode has obtained the name of *Dibra Daira*, or "the place of worship." His eldest son founded a sect of devotees named *Nanuck Sholy*; but his second employed himself in the usual occupations of mankind. On account of the oppression of the Mohammedan governors, however, he removed from *Telvandi*, the estate of his ancestors, and settled at *Kartarpour*, which his descendants still possess. They are respected by the Seiks on account of their being the posterity of *Nanuck*, but are not held in any veneration on a religious account.

The doctrines of *Nanuck* were taught by a favourite disciple of his named *Lhina*, but on whom he bestowed on his death-bed the appellation of *Angud*. By him the doctrines of the sect were collected in a work named *Pothy*, or "the book;" and an history of the life of *Nanuck* himself was given in another named *Jenum Sakky*. Both these were written in a particular kind of character called *Gour Mouekty*, and said to have been invented by *Nanuck* himself. *Angud* named for his successor another disciple called *Amerdofs*; and this method of continuing the succession seems to have been practised as long as the disciples continued to own one supreme chief.

For many years the Seiks lived in peace, and gained the good-will of the Mohammedan governors by their quiet and inoffensive behaviour. By degrees their numbers and their power greatly increased, but in proportion to their good fortune, they seem to have lost their virtue; so that their gourous, or chiefs, who had hitherto borne the character of apostles, at last stood forth as military leaders. The first of these was named *Taigh*, whose successor, named *Govand Sing*, was the tenth and last of the gourous. He engaged in a rebellion against the government; but was at last obliged to submit, and even attended the emperor *Bahader Shah* in person. At last he was assassinated by a *Petan* soldier, not without a suspicion of the emperor himself being concerned. As he did not name a successor, his followers chose a chief for themselves named *Banda*, who soon began to make depredations on his neighbours; but being at last taken prisoner, and sent to *Delhi* with his family and many of his countrymen, they were all put to an ignominious death. By this execution the Seiks were so much exasperated, that they swore eternal vengeance against the Mohammedans, and have ever since manifested a most implacable hatred against them. Taking advantage of the distraction of the Mogul empire by the invasion of *Nadir Shah*, they conquered several provinces. Wherever they came they threw down the mosques, and obliged every one to quit the country who refused to embrace their tenets. Their war with *Ahmed Shah* has been already mentioned. Since his death they have recovered all the territories they lost during their contest with him; and now possess the greatest part of *Moultan*, as well as several districts in the province of *Delhi*; including in their territories the

Hindoostan. the whole of that rich country named the *Panjab*, on account of five rivers which descend from the northern mountains, and inclose or intersect it, running afterwards into the Indus.

The Seiks, as has already been mentioned, worship one God; but without image, or believing in any mediator. They eat all kinds of meat except beef; sparing the black cattle, in all probability, on account of their utility. Pork is very generally eaten, probably on account of its being forbidden by the Mohammedans. They are commonly dressed in blue, a colour reckoned unlucky by the other Hindoos. Their dress consists of blue trowsers of cotton, a sort of plaid generally chequered with blue and thrown over the right shoulder, with a blue turban. Their government is lodged in an assembly of different chiefs; but who, as individuals, are independent of one another, and have separate territories. They meet annually, or oftener if occasion requires, at a place called *Antberfer*, which is held in a kind of religious veneration; where there is a large tank lined with granite, and surrounded with buildings, and beautifully ornamented. Their force is very considerable, amounting to no fewer than 200,000 cavalry. However, they can seldom be brought to act in concert, unless the whole nation be threatened with some imminent danger. They are a strong hardy race of men, and capable of bearing much fatigue; and so expert in war, that of late almost all the neighbouring countries have been laid under contribution by them, several petty chiefs having consented to pay them a small annual tribute in order to avoid their incursions. When in the field, none but the principal officers have tents, and those extremely small, so that they may be struck and transported with the greater quickness and facility. In cold weather the soldiers wrap themselves during the night in a coarse blanket, which in the time of marching is folded and carried on their horse. Their country is well cultivated, populous, and abounding in cattle, particularly horses, which are reckoned the best in all Hindoostan. This may probably be owing to the studs which were formerly established in different places of the province of Lahore on account of the Mogul himself. Stallions were sent thither from Persia and Arabia, and there was a fixed order to send to the studs in Lahore all such Arabian and Persian horses as by any accident should be rendered unfit for mounting. Notwithstanding their deism, the Seiks are said to have a superstitious veneration for their sword; inasmuch, that before one of them will eat with a person of another religion, he draws his sword, and passing it over the victuals, repeats some words of prayer, after which he will freely partake of them. Contrary to the practice of all the other Hindoos, they dislike the smoking of tobacco; but many of them smoke and chew bang, which sometimes produces a degree of intoxication.

3. The provinces of Delhi have, in the course of a few years, frequently changed their masters, but have scarce at any period during that time been under the authority of the sovereign. Their last governor was named *Nadjiff Khan*, under the title of generalissimo of the emperor. He was involved in the ruin of Mohammed Kouly Khan, cousin to Soujah al Dowlah; after which he went to Cassim Aly Khan nabob of

Bengal; after whose expulsion he retired with a party of horse to Bundelcund into the service of Rajah Coman Sing. He next joined the English; and at last became the general of Shah Allum. With a body of English seapoys who had been put under his command, and some other troops whom he had taken into his service, he subdued the countries near Delhi, conquered almost all the territories of the Jauts, reducing the cities of Agra, Dieg, and other principal towns. These conquests were indeed effected in the name of the Mogul, but he derived little benefit from them; Nadjiff being the real master, and keeping possession of them till his death, which happened in 1782: and since that time the countries we speak of have been involved in a scene of continual anarchy and bloodshed.

4. Next to the provinces of Delhi are the dominions of the independent rajahs, whose dominions lie contiguous to one another. The principal are those of Joinagar or Jaypour, Joadpour or Marwar, Oudiapour or Chitore, and Jesalmire. These countries are under a kind of feudal constitution, and every village is obliged to furnish a certain number of horsemen at the shortest warning. The people are brave, hardy, and very much attached to their respective chiefs; and their army is very formidable, amounting when collected to about 150,000 horsemen.

5. The Jauts were a tribe who followed the occupation of agriculture in the northern parts of Hindoostan. About 40 years ago they were formed into a nation by Tackou Souragemul, proprietor of an inconsiderable district. After making himself master of all the countries dependent on Agra, of the town itself, and many other important places, he was killed in battle with Nadjib ul Dowlah, the Rohilla chief, in 1763. Since that time the power of this people has been so much reduced by domestic contentions and foreign wars, that the present rajah possesses only a strong town named *Bartpour*, with a small district around it. The Jauts, however, it is said, are now manifesting a martial disposition, and thus may possibly be soon in a condition to recover their former extent of territory.

6. The most considerable of all the Hindoo powers are the Mahrattas, with whom the Europeans first became acquainted in their original territories of Malabar. The first of their chiefs was named *Seeva*, or *Seeva-jee*; who is said to have been descended from the ancient Hindoo emperors, and whose father was lord of a small district, for which he paid tribute to the Mohammedan king of Viziapour. For some reason, unknown to us, he was at last arrested by order of that king, and died in confinement; but his son *Seeva-jee* took up arms in defence of his country, and made himself master of several important places, with a considerable tract of territory, which were afterwards ceded to him by the queen-regent, the king of Viziapour having died soon after the commencement of the war.

Seeva-jee having thus established himself, soon became formidable to his neighbours. Many of the Hindoo princes put themselves under his protection, and he at length ventured to make war upon the emperor Aurengzebe. In this he proved unsuccessful, was taken prisoner, and carried to Delhi. Having found means, however, to make his escape, he quickly recommenced hostilities;

Hindoostan. and the emperor, who was now far advanced in life, thought proper to come to an accommodation with so troublesome an enemy. On this occasion the Mahrattas pretend that their prince obtained a grant of 10 *per cent.* on all the revenues of the Deccan; which has often served as a pretence to invade that country, and levy contributions on the southern nabobs. Since that time the Mahrattas have become so powerful, that all the princes of *Hindoostan* are alarmed when they put themselves in motion. Their territories extend about 1000 miles in length and 700 in breadth; and they are governed by a number of separate chiefs, all of whom acknowledge the Ram Rajah as their sovereign, and all except Moodajee Booslah acknowledge the Paishwa as his vicegerent. The capital of the sovereign was Sattarah; but the Paishwa generally resides at Poonah, one degree to the southward, and about 100 miles distant from Bombay. The country extends along the coast nearly from Goa to Cambay. On the south it borders on the territories of Tippoo Saib; on the east it has those of the Nizam and the rajah of Berar; and on the north those of the Mahratta chiefs Sindia and Holkar.

7. The rajah of Berar, besides that country, has the greatest part of Orixá. His dominions extend about 600 miles in length from east to west, and 250 from north to south. The eastern part of the Orixá extends along the sea-coast for about 150 English miles, and divides the British possessions in Bengal from those commonly called the *Northern Circars*. On the west his territories border upon those of the Paishwa; on the south, upon those of the Nizam, Mahomet Hyat a Patan chief, Nizam Shah, and Ajid Sing. The rajah himself resides at Nagarpour, about midway betwixt Calcutta and Bombay.

8. Madajee Sindia has the greatest part of the government of Malva, together with the province of Cardeish. The remainder is under the government of Holkar; who, as well as Sindia, pretends to be descended from the ancient kings of Malva. The principal residence of Sindia is at Ugein near the city of Mundu, which was once the capital of these kings. Holkar resides at Indoor, a town little more than 30 miles to the westward of the former. The dominions of these, and some other princes of smaller note, extend as far as the river Jumma.

The two last mentioned princes, though properly Mahrattas, own no allegiance to the Ram Rajah or great chief to whom the main body are nominally subject. Some time ago the Mahrattas aimed at the conquest of all *Hindoostan*, and even avowed a design of expelling all the Mohammedan princes; but their power was effectually checked by the British, and their dissensions among themselves put an end to all schemes of that kind. Still, however, they were ready to watch every opportunity of invading the territories of their neighbours; and their resources being so considerable, they were deservedly accounted a very formidable enemy. The strength of their army consists chiefly in cavalry; and both men and horse are capable of enduring a great deal of fatigue. Bodies of 50 or 60,000 cavalry have been known to travel 50 miles a day for many days together; which, considering the excessive heat of the country, must certainly appear very surprising. The country abounds very much in horses, and there is one

kind named the *Bheemerteddy* horse, which is greatly esteemed, and sold at a very high price. The common horse of these parts is lean and looks ill, but is abundantly fit for the purposes of war. The only weapon used by the horsemen is a sabre; in the use of which they are so dexterous, that it is supposed the best European hussar would not be more than a match for a Mahratta horseman. There are considerable studs in every province belonging to the Paishwa and different chiefs; and there are likewise many *jundis* or great herds of horses belonging to particular persons, who turn those they have no occasion for loose in the open plains.

The Mahratta horsemen are dressed in a quilted jacket of cotton, which is supposed to be one of the best defences against a sword that can easily be contrived of equal lightness; but the heat of the climate frequently renders it necessary to be taken off. The rest of their dress consists of a pair of trowsers, and a kind of broad turban which descends low enough to cover the neck and shoulders. In cases of emergency the horsemen carry provision both for themselves and their horses in a small bag tied upon the saddles: the food of the rider consists only of a few small cakes with a little flour or rice, and some salt and spices; the horse is fed with a kind of peas named *gram*, or with balls made of the flour of these peas mixed with butter, prepared after a certain manner, and named *ghee*, together with some garlic and hot spices. These balls are given by way of cordial, and have the property of invigorating the animal after extraordinary fatigue. Sometimes it is said that they add a small quantity of *bang*; a kind of drug which possesses an exhilarating virtue, and produces some degree of intoxication. The Mahratta cavalry seldom make any use of tents: even the officers frequently have no other accommodation than a small carpet to sit and lie on; and a single camel is able to carry the whole baggage of the general. The officers, however, are generally well mounted, and have spare horses in the field.

All the subjects and vassals of the Mahratta princes are generally ready to follow them into the field; and in any case in which the honour or interest of the nation appears to be concerned, they generally unite in the common cause. Before they invade any country, the general is at great pains to inform himself of the nature and situation of it; and they have now made incursions into so many different parts of *Hindoostan*, that there are but few countries there with which they are not very well acquainted. Their great sobriety, and the fatigue they are capable of undergoing, render them very dangerous enemies. In all their expeditions the soldier first provides for his horse, and then goes to his own meal; after which he lies down contented by the side of the animal, and is ready to mount him at the first sound of the *nagar* or great drum. They have their horses under the most excellent management; and by perpetually caressing and conversing with them, the animals acquire a degree of docility and sagacity unknown in other countries. When on an expedition, the horses are accustomed to eat grass pulled up by the roots, which is said to be very nutritive, and to be destitute of that purgative quality which belongs to the blade alone. When they make an invasion, the devastation is terrible; the cattle

Hindustan. are driven off, the harvest destroyed, the villages burned, and every human creature destroyed who comes in their way. Notwithstanding this barbarity in time of war, however, they are very humane in time of peace, living in great harmony among themselves, and being always ready to entertain and assist strangers. Many of the cruelties they commit may be justly reckoned the effects of retaliation for other cruelties exercised upon them by their adversaries. Thus in 1771, after having given Hyder Ally a great defeat, they cut off the ears and noses of a whole regiment of prisoners, and in that condition sent them back to their commander in return for his having done the same to a few prisoners he had taken some time before.

The revenue of the Paishwa is very considerable; being not less than ten millions sterling; but after deducting the expence of collection, and the expence of troops kept in readiness for the service of the state, it is supposed that he cannot receive more than four millions. From this again we must deduct the expences of the troops immediately belonging to the Paishwa himself, and which may amount to about three millions sterling; so that there remains a surplus only of one million after paying all the necessary expences of government. This nevertheless has been managed with such economy, that though long and expensive wars were carried on after the death of Nairn Row, the state was not only clear of debt, but there was a surplus of two millions in the treasury, which Rogobah dissipated.

9. The *Deccan*, as left in 1748 by Nizam al Mulek, was by far the most important and extensive soubadary or viceroyship in the empire. It then surpassed in size the largest kingdom in Europe; but since that time many provinces have been conquered by the Mahrattas, and the northern Circars by the British. The possessions of the Nizam are also diminished by the cession of the Carnatic to the nabob of Arcot; great part of the territories of Tippoo Saib; and many other provinces of less note. Still, however, the Nizam possesses very considerable territories; but his finances are in such a wretched condition, and his provinces so ill governed, that he is accounted a prince of no consequence, though otherwise he might be reckoned one of the most considerable powers of *Hindustan*.

10. The dominions of Tippoo Saib, the son and successor of Hyder Ally, are bounded on the north by the territories of the Paishwa; on the south by Travancore, the territory of an independent Hindoo prince; on the west by the sea; and on the east by a great ridge of mountains, which separate them from the territories of the nabob of Arcot. The country lying to the eastward of these mountains is called the Carnatic *Payen Ghat*, and to the westward the Carnatic *Bhalla Ghat*. The latter belongs to Tippoo Saib; and the two together make up the country formerly named the *Carnatic*, though the name is now restricted to the *Payen Ghat*. The situation of the Bhalla Ghat is considerably more elevated than the other; by which means the temperature of the air is much cooler. On the coast of Coromandel there is a pile of ruins called by the natives *Malavipatam*, and by the British the *seven pagodas*. Concerning this there is a tradition, that it once stood at a considerable distance from the sea; though most of the ruins are now covered with water;

and there is likewise a tradition, that the mountains we speak of once formed the boundary of the ocean. The revenue and strength of Hyder Ally are said to have been greatly exaggerated; the former amounting to no more than four millions annually, though by his economy and good management he made it answer every purpose both in time of war and peace. He was at great pains to introduce the European discipline among his troops; but notwithstanding all his endeavours, he was far from being able to make them cope with the British. The advantages he gained were owing to his vast superiority in cavalry, and the celerity of his marches; which would have been counteracted had his adversaries been possessed of a good body of cavalry; and it is probable that the event of the war would have been decided in a single campaign. His son Tippoo Saib is said to be a man of less abilities than his father, though more violent in his disposition. Against this prince hostilities have lately been commenced by the British in conjunction with the Mahrattas, between whom an alliance had been formed. But this event has not as yet been attended with any consequences that merit a detail.

With regard to the present government of *Hindustan*, our limits will not allow us to enter particularly upon it, nor indeed is it perhaps of any importance, as the country is divided into so many different kingdoms; the sovereigns of which, however they may differ in other respects, seem all to agree in despotism and oppression of their subjects. As a very considerable part is now under the dominion of Britain, it may be necessary to take some notice of the behaviour of our countrymen in that part of the world, especially as an idea of their excessive despotism and oppression of the natives has of late prevailed so much, that the national character has suffered considerably by it. This has arisen partly from the great pains taken to propagate it, and partly from the ignorance of those among whom the report was circulated; and the exaggerated accounts and contentions of the members of the government themselves, have contributed no less to confirm and heighten the prejudices of the public.

The British territories in the East Indies were originally under the jurisdiction of a governor and 13 members; but this number has fluctuated occasionally from 14 to 4, at which it was fixed by act of parliament. In this council all matters, whether relating to peace or war, government or commerce, were debated, the governor having no other superiority than that of giving the casting vote. In other respects the whole executive power was lodged in his hands, and all the correspondence with the native princes of India was carried on by his means, the dispatches to them being signed by him singly; and all the princes and great men who visited the presidency were first received by him, and then introduced to the counsellors. He was military governor of Fort William, and commander in chief of the presidency; whence, as by his office he was invested with a considerable degree of power, he became an object of some envy and jealousy to the members of the council and other considerable people in that part of the world. In consequence of this, the government was divided into two parties, one siding with the governor, and the other opposing him; in consequence of which, the debates were frequently carried

Defence of
the British
govern-
ment in the
east.

Hindustan. ried on with such heat and violence, that the records of the company are frequently stuffed with nothing but accounts of the contentions of these jarring parties. This indeed may be looked upon as one of the principal causes by which the reputation of the British government in the eastern parts of the world has suffered; for as there were very frequently opinions diametrically opposite to one another recorded upon the same subject, the contending parties in the British parliament had always sufficient authority for what they said, let them take which side they would; and thus the characters of all concerned in the East India government were, by one person or other, set forth in the most opprobrious light.

Another source of reproach to the British government in India was, that the court of directors in England became infected with the same spirit of party and contention which pervaded all other departments of the state. Lord Clive and Mr Sullivan were the two great leaders in these party-disputes; and as the interest of the one or the other prevailed, different persons were appointed to the administration, and different measures adopted. The event of all this was, that whenever a new administration was formed, the first object was to condemn the measures of those who had gone before them. Thus, in the year 1764, when Lord Clive was made governor of Bengal, the new directors represented the affairs of the company as in the worst situation imaginable, from which they could only be extricated by the abilities of Clive. On the arrival of the latter in the east, he took care to write home reports to the same purpose, and to condemn in the most violent manner every thing that had been done; the whole body of the company's servants were censured indiscriminately without being allowed any means of defence, as they were in truth ignorant of the charges brought against them. When the affairs of the company were brought under a parliamentary review in the year 1774, the government was brought under a new regulation. It now consisted of a governor-general and four counsellors; three of whom were sent from England; two being military gentlemen of high rank, and the third a gentleman employed in the war-office. On their arrival they proceeded in the same manner that Lord Clive had done before them: they pronounced in the most decisive manner, that the company's affairs were in a ruinous state; and that every species of corruption had been practised by the former government. This general accusation, unsupported by any kind of evidence, was the constant theme of the dispatches sent by them to England; and thus has the reputation of the British government suffered exceedingly through the unwarrantable liberties which its own servants have been allowed to take with one another. It must also be considered, that from the remote situation of India, and the unavoidable ignorance of its affairs on that account, it was easy for any person, whose malicious purposes it might suit, to prejudice the public against the servants of the company to as great a degree as he pleased. Hence some persons, soured by disappointment, or envious of the supposed emoluments of others, represented matters in such an unfair light to their correspondents in England, that the most unjust and shameful charges were frequently brought against innocent persons, which they

Hindustan. could neither prevent nor defend themselves against. The dreadful famine which took place in Bengal in the year 1769, offered to these malevolent persons a most fruitful source of calumny; and many individuals were accused of having brought on this dreadful calamity, which arose entirely from a natural cause, *viz.* the failure of the rains, and which no human power could have prevented or removed.

Opinions of this kind have not only been circulated through the island of Britain in the most open manner, but have even appeared in some very respectable publications. Thus in Mr Smith's Treatise on the Wealth of Nations, when speaking of the oppression arising from monopolies, and comparing their effects in different states: "The English company (says he) have not yet had time to establish in Bengal so perfectly destructive a system. The plan of the government, however, has had exactly the same tendency. It has not been uncommon, I am well assured, for the chief, that is, the first clerk of a factory, to order a peasant to plow up a rich field of poppies, and sow it with rice or some other grain. The pretence was to prevent a scarcity of provisions; but the real reason, to give the chief an opportunity of selling at a better price a large quantity of opium he had on hand. Upon other occasions the order has been reversed, and a rich field of rice or other grain has been plowed up to make room for a plantation of poppies, when the chief saw that extraordinary profit was to be made by opium." To this, however, the following answer has appeared in a late publication, intitled *A short Review of the British government in India*. "The poppy is a plant which requires a peculiar soil, and particular care in the culture of it. The medium price of the land on which it is cultivated is about 11 or 12 rupees a *begah*, or one third of an English acre. It is sowed at the beginning of October, when the season of the periodical rain expires. The plant begins to be fit for incision, in order to extract its juice, of which opium is made, about the end of December, and continues so till March. It requires a dry soil, and can be brought to maturity only in the dry season, when the periodical rains have ceased. Paddy or rice lands let on a medium at three rupees a *begah*. Rice is sowed about the end of May, just before the periodical rains commence. One crop is raised about the end of September; and another, which is the last, and by far the greatest, about the end of December. It requires a soil saturated with water, and lies soaked in it for a considerable time. On this account it is sowed just before the periodical rains commence; and nine-tenths of the quantity of rice produced in the company's provinces grow in the kingdom of Bengal, which is so low and flat, that the grounds are either overflowed by the rivers Ganges and Burrampooter, with their tributary streams, or soaked with the rain which falls and stagnates upon them. It is therefore evident, that the soil and the season, which alone can fructify the paddy or rice, would rot and destroy the poppy; and it is therefore as evident, that it is utterly impossible, from the nature of the two plants, that the one can be plowed up to sow the other."

With regard to the administration of the British affairs in the East Indies, it must also be remarked, that the company now act in a very different capacity from what

Hindustan. what they originally did. From a society of merchants, they are now become sovereigns of the country to which they trade. The latter character was quite foreign to them; and they have accordingly looked upon that of merchants to be the principal one, while that of sovereigns was to be only a kind of appendage to it. Thus, instead of acting for the interest of the country they govern, and which as sovereigns they naturally ought to do, they have acted in many cases directly opposite to it, which, as merchants, is also their natural interest. Hence also, when the administration in India did any thing in obedience to the orders of the directors, which orders being dictated by merchants, were prejudicial to the interests of the country, that injury has been sometimes unjustly attributed to their servants, who acted merely in obedience to the orders they received. On the other hand, when the India administration acted with the generous spirit of sovereigns, they were sometimes blamed by the directors, who judged as merchants, and sometimes by the ministry, who were always ready upon the smallest pretence to interfere in their affairs.

At the time when the British administration first commenced in Hindostan, the Hindoo governors were universally named *Rajahs*; but though many of the Hindoo families yet bear that title, it does not appear to resemble, in any manner of way, our titles of nobility, or to be a dignity which can be conferred by any of the princes, or even by the Mogul himself. Hence, in that part of the world there are no ancient nobility, the titles being conferred merely by usurpers, who have neither right nor title derived from any thing but violence.

In this country we find the title of *Zemindar* very common; a word compounded of two others, signifying, in the Persian language, a *landholder*. It appears to have been introduced by the Mohammedans, and to have been a kind of temporary office, prescribing the performance of certain duties, and requiring security for the personal appearance of the *Zemindar*. He is obliged to attend the exchequer of the king's chief collector, at the commencement of every new year, to settle his revenues; and he is not allowed to enter upon the duties of his office for the year without a special order for that purpose. On the death of a *Zemindar*, the candidate for succession must petition the sovereign, engaging himself to perform all the stipulated duties, and to pay the customary fees; nor can he enter upon his office without a special investiture. As the *Zemindars* were by virtue of their office invested with considerable power, they soon became not only very despotic in their own dominions, but by degrees began to encroach on the power of the sovereign himself. After the irruption of Nadar Shah every thing was thrown into confusion; the viceroys threw off obedience to the emperor, the nabobs threw off all obedience to them, and usurped their power; at which time it is probable that the *Zemindars* likewise assumed powers to which they were by no means intitled from their office. Notwithstanding this, however, they were sometimes treated by the Mohammedan governors as mere revenue-officers, and used very harshly. At some times there were a set of people bound for the *Zemindars* under the title of *Woodedars*; and these had either a joint power with the former, or

were superior to them in the collection of the revenues; and sometimes they were superseded by officers appointed immediately by government itself, under the various names of *Aumils*, *Tabfilders*, or *Sezawruls*. —The *Zemindaries* are not limited in extent or value; there being some in Bengal which yield a revenue as high as 350,000l. sterling, while others scarcely amount to 350l.; but all the great *Zemindars*, and many of those in middling circumstances, having procured for themselves the title of *Rajah*, affect much pomp and state in their different districts, and keep their inferiors in as great subjection as the Mohammedan governors keep them. Some of them also have their power augmented by being of the bramin cast; and by the reverence supposed to be due to religion on that account, joined with the power conferred upon them by the sovereign, they are in general rendered exceedingly despotic, with an almost unlimited authority to plunder their tenants; in which they were indulged by the Nabobs from the motive of plundering them again. From the consultations of the select committee in 1769, we are informed that the *Zemindars* have a power of levying fines at pleasure; that they raise large sums from duties collected in the market; and that they frequently oblige the ryots or husbandmen to work for nothing. In short, the same claims made by the European barons on their vassals in the times of the feudal system, are now made by the *Zemindars* on the common people of Hindostan. If one of them is to be married, if he has a child born, if honours are to be conferred upon him; nay, if he is even to be fined for his own misconduct, the poor ryot must always contribute his share. Mr Scrofton, in his history of Hindostan, sets forth the situation of the inhabitants in the following words:—"Unhappily for the Gentoos, themselves are made the ministers of oppression over each other; the Moor-men, haughty, lazy, and voluptuous, make them, of whom they have no jealousy, the ministers of their oppression, which further answers the end of dividing them, and prevents their uniting to sling off the yoke; and by the strange intoxication of power, they are found still more rapacious and cruel than their foreign masters: and what is more extraordinary, the bramins still exceed the rest in every abuse of power, and seem to think, if they bribe God by bestowing a part of their plunder on cows and saquirs, their iniquities will be pardoned."

From this account of the situation of the people of Hindostan under their native rulers, it is by no means probable that they could make a worse exchange by falling under the jurisdiction either of the Mohammedans or Europeans. A notion indeed hath been industriously propagated, that the British government has behaved with the greatest cruelty in collecting the revenues, and that they have even invented tortures to make the rich people discover their treasures; but on examining the matter impartially, the reverse of this is found to be true. At the time that the British government interfered in the affairs of Hindostan, the provinces were found to be in a ruinous state, in consequence of the wars which had taken place in the country. Even in the most settled state, and when the administration was most regular, the government was altogether despotic, and the mode of collecting its revenues extremely arbitrary;

Hindustan.

Hindustan.

bitrary; the punishments inflicted very cruel; and the whole system of government such as would be reckoned quite shocking in Europe. It is only within these few years that the British could effectually interpose in behalf of the natives; and in that short time it has produced a very considerable reformation. It is certain, that the British government has discouraged oppressive measures as much as possible; abolished the cruel modes of punishment used by the Mohammedans; and by instituting a more regular plan of justice, has procured ease and security to the natives, and preserved them in a state of tranquillity altogether unknown to them before its commencement. Many instances of the greatest cruelty exercised upon the Zemindars and other collectors are to be met with in the history of Bengal, written by a native historian, and translated by Gladwin: yet the person who exercised these cruelties was dignified with the titles of the *faithful servant of the Empire*, and the *Glory of the State*; which shows that the people were absolutely familiarised with cruelty, and did not know what it was to be under a lenient government. Since the British had the dominion, matters have been totally reversed, and the Hindoos, instead of being treated with cruelty, persecuted on account of their religion, and compelled to renounce it, have been used with at least comparative lenity, and great indulgence has been shown to them even in their most absurd practices and superstitions. When the British government first accepted of the office of Dewanny, or collection of the revenues, it was not in their power to interpose with any kind of efficacy for the relief of the inhabitants; because it was at first thought proper to allow the taxes to be collected by natives, who would undoubtedly follow their ancient modes of collection. Even at that time, however, the mildness of the British governors had some effect upon the Asiatics; so that the people in general were treated with more lenity than formerly: and in the year 1772, when the council of Bengal openly assumed the office of Dewan themselves, an immediate stop was put to all those arbitrary and oppressive methods which had been formerly in use. Formerly some Zemindars had been flogged even to death, by an instrument called a *Korah*: but from the moment that the British council took the collection into their own hands, not only this instrument was laid aside, but all kind of corporal punishment; by which means the severity of the Mohammedan government has been entirely abolished, and no other punishments inflicted in cases of insolvency than such as are in use in our own country. Still, however, in such extensive dominions, where a great share of power must be one way or other committed to the natives, it is impossible but some arbitrary acts must be committed, as the natives are always prone to acts of despotism whenever they can commit them with impunity; but examples of this kind cannot with any degree of candour be brought as a general charge against the British government in India.—Mr Scrofton gives the following account of the wretched state of the provinces now under the British jurisdiction at the time they were ceded to them by the Mogul. “When the governors of the provinces found the weakness of the Mogul, and each set up as sovereign in his own province, although they could not break through these immutable laws, they invented new taxes under new

names, which doubled or trebled the value of the original ones, and which the landholder was obliged to levy upon his tenants. The old stock of wealth for some time supported this; but when that failed, and the tenants were still pressed for more, they borrowed money of usurers at an exorbitant interest; and the government still continuing these demands, the lords of the lands were obliged to do the same: but as all this while the value of lands did not increase, the consequence was, that at last, unable to pay the interest of the mortgages, the rents were seized by rapacious usurers. The government finding the revenues fall shorter every year, at last sent collectors and farmers of the revenues into the provinces. Thus the lord of the land was divested of power over his country, and the tenants exposed to merciless plunderers; till the farmer and manufacturer, finding that the more they laboured the more they paid, the manufacturer would work no more, and the farmer would cultivate no more than was just sufficient for the subsistence of his family. Thus this once flourishing and plentiful country has, in the course of a few years, been reduced to such misery, that many thousands are continually perishing through want. The crown lands are still worse off, let out to the highest bidder; and the Jagheer lands alone remain unplundered. Hence that equal distribution of wealth that makes the happiness of a people, and spreads a face of cheerfulness and plenty through all ranks, has now ceased; and the riches of the country are settled partly in the hands of a few usurers and greedy courtiers, and the rest is carried out of the country by the foreign troops taken into pay to maintain the governors in their usurpations. This unhappy decay the India company has already experienced in the decay of their trade, and the rise and price of their manufactures; and will, I fear, experience more and more annually.”

With regard to the depositions of the Nabobs by the British, which has been used as a great argument against the general spirit of British government in those parts, it must be remembered, in the first place, that these Nabobs were mere usurpers, who had not the least title to their dominions, and consequently could not, in point of right, complain more reasonably of being deprived of their dominions, than the persons from whom they had taken them might do of their injustice in driving them out. Their behaviour in government also was such, that it was impossible it could have subsisted for any length of time without the absolute ruin of the countries they possessed. Thus, in the case of Jaffier Aly Cawn, Mr Vansittart declared the country to be in so confused and impoverished a state, that in all human appearance another month could not have been run through before he would have been cut off by his own Seapoys for want of pay, and the city become a scene of plunder and disorder. On this account he was degraded, though without any of those circumstances of cruelty which generally characterise the revolutions in this part of the world. The administration was transferred to his son-in-law Meer Cossim; who being an enemy to the British government altogether, a war followed, terminating in his expulsion. This was followed by the invasion of Sujah Dowlah, and by scenes of horrid barbarity and devastation; when in 1765 Lord Clive took

Hindustan. took upon him the office of Dewan, or minister who superintends the lands and collections of the revenue. An account of his proceedings has already been given; but whatever applause he might gain, and in some respects deservedly at the time, it is now said, with some probability, that he raised the expectations of the people of England by far too high. The seeds of the succeeding evils were already sown. Many sources of wealth were dried up. Raw-silk, cloths, and other manufactures, had formerly been exported to Guzerat, Lahore, and even Ispahan. This had ceased on the invasion of Nadar Shah; and the influx of wealth from the European nations had ceased before the British government in Bengal had an existence. It was computed that Cossim Aly Cawn robbed the country of near five millions sterling in jewels and specie. China, Madras, and Bombay, were supplied from Bengal to the amount of more than two millions; and several other circumstances besides these contributed to diminish the riches and opulence of the country. In the mean time the internal administration of the country had been extremely defective. The Zemindars being under very little restraint, acted in a very arbitrary manner within their own districts; and the tenants had no redress against the impositions and exactions which were laid upon them. Meir Cossim appointed *Aumils* to the collection of the revenues rather than Zemindars. The *Aumils* derive their authority directly from the person who has the command of the country for the present time, and consequently are more easily called to an account than the Zemindars. At last, however, these *Aumils*, having obtained too great an influence in the country, Lord Clive thought proper to change the plan of collection. Three natives were now appointed, in the nabob's name, to superintend this department; and one English gentleman, through whom the business was transacted, had his residence at the nabob's court, and communicated the intelligence to Calcutta. The principal acting minister in this plan, however, thought proper to change the mode of collection once more, and to re-appoint the *Aumils*; in consequence of which the revenue became greatly diminished, and they were besides complained of as greatly oppressing the people. To remedy these evils, it was first proposed by Mr Verelst to send some of the company's servants into the internal parts of the country with the title of supervisors: but the defects of administration were now beyond their power to remedy; the revenue was not only greatly diminished, but the expence of government exceedingly augmented; and in the year 1771 the company were alarmed by accounts that bills had been drawn upon them to the amount of 1,200,000*l*. At this time Mr Hastings was appointed to be governor of Bengal; and the confused state in which matters were at the commencement of his administration will easily appear from the following part of a letter from the government of Bengal, dated in the month of November 1772.—“Every zemindary was left to its own particular customs. The articles which composed the revenue, the form of keeping the accounts, the computation of time, even the technical terms, which ever form the greatest obscurity in every science, differed as much as the soil and productions of the province. The nabobs exacted what they could from the zemindars and great farmers of the re-

VOL. VIII. Part II.

venue, whom they left at liberty to plunder all below, reserving to themselves the liberty of plundering them in their turn, when they were supposed to have enriched themselves with the spoils of the country. The mufaddies, who stood between the nabob and zemindars, and between them and the people, had each their shares of the public wealth. These profits were considered as illegal embezzlements, and therefore were taken with every precaution which could ensure secrecy; and being, consequently, fixed by no rule, depended on the temper, abilities, or power, of each individual for the amount. It therefore became a duty to every man to take the most effectual measures to conceal the value of his property, and evade every inquiry into his conduct; while the Zemindars and other landholders, who had the advantage of long possession, availed themselves of it by complex divisions of the lands, and intricate modes of collection, to perplex the officers of government, and confine the knowledge of the rents to themselves. The internal management of each district varied no less than that of the whole province. The lands subject to the same collection, and intermixed with each other, were some held by farm, some superintended by shickdors or agents on the part of the collector, and were left to the Zemindars themselves, under various degrees of control.” For some political reasons the company, though they had acquired the Dewanny, had not yet chosen to assume the executive part of the office themselves, but committed it to the management of natives, as has already been mentioned, and their plans had been found extremely defective. By the time that Mr Hastings had been invested with the government, the court of directors had resolved to change their plan, and openly assume the office of the Dewanny; and the rules established by that gentleman for the collection of the revenues, his mode of administering justice, and his police for the government of the country, are still observed with very little variation.

The plan for collecting the revenues consisted, in the first place, in rendering the accounts as simple and intelligible as possible; in the next, in establishing fixed rules for the collection; and in the third, making the mode of them uniform in all parts of the provinces; and in the fourth, providing for the equal administration of justice. The power of the Zemindars was now circumscribed, and their extortions thoroughly put a stop to; many vexatious taxes and tolls were abolished, and a new mode of collecting the customs was established, to the great relief of the merchants: and so well were all the parts of this plan found to be adapted to the purposes they were designed to answer, that it has hitherto been made the model of all subsequent regulations.

One great objection to the India government is, that the English law, which undoubtedly is better calculated than any other for securing the liberties of the people, has not yet been adopted in India; whence it is thought that the company's servants have still showed a disposition to oppress, rather than to relieve, the oppressed inhabitants of Hindostan. But in answer to this it is said, that the difference betwixt the two countries is so great, that there can be no comparison betwixt the one and the other, nor can the constitution of England be in any degree adapted to that of the

other.

Hindoostan. other. The religion, laws, manners, and customs, of both Hindoos and Mohammedans, are so essentially different from those of this country, that it is impossible to assimilate them, should ever any thing of the kind be attempted. The only true method therefore of judging whether the present state of Hindoostan is preferable to what it formerly was, is to compare it with what it was under the best Mogul emperors; and in this comparison it must certainly appear that the preference is greatly in favour of the British administration. In Major Rennel's work we are informed, that during the reign of Ackbar, whom he styles "the glory of the house of Timur," the country had never enjoyed so much tranquillity; "but this tranquillity would hardly be deemed such in any other quarter of the world, and must therefore be understood to mean a state short of actual rebellion, or at least commotion." The same author, speaking of the state of the British empire there, uses the following words: "The Bengal provinces, which have been in our actual possession near 23 years, have, during that whole period, enjoyed a greater share of tranquillity than any other part of India, or indeed than those provinces had ever experienced since the days of Aurengzebe." To this we may add, that the provinces have not only experienced a perfect freedom from external invasions, but likewise enjoy a degree of internal tranquillity altogether unknown before, by the subjection and civilization of a set of banditti who inhabited the hills of Rajemahl, and infested the travellers who passed that way; a wandering tribe of religious mendicants, who were wont to commit the greatest enormities.

Another advantage the inhabitants of this country reap from the British government, is the security from violence and oppression either by their Mohammedan superiors or by one another. Under the article **HINDOO** we have already mentioned the particular circumstance that these people are liable to the punishment of losing their cast from a variety of causes, and that this is looked upon by them to be the most grievous calamity they can suffer. The Mohammedan governors frequently took advantage of their superstition in this respect to oppress them; and this circumstance alone frequently produced the most horrid confusion. In the instructions given to the supervisors, Mr Verelst informs them, that "it is difficult to determine whether the original customs, or the degenerate manners of the Mussulmen, have most contributed to confound the principles of right and wrong in these provinces. Certain it is (adds he), that almost every decision of theirs is a corrupt bargain with the highest bidder. Compensation was frequently accepted of even for capital crimes, and fines became at last an intolerable grievance; nay, so venal were the judges at that time, that it became at last a settled rule to allow each of them a fourth part of any property in dispute as a compensation for his trouble.—It is impossible to suppose that such monstrous abuses continue under the British government: on the contrary, we must readily believe, what the governors themselves assert, that immediately after the provinces fell under British jurisdiction, both Hindoos and Mohammedans have been left to the free exercise of their religion, laws, and customs. The Hindoos themselves acknowledge this, and are as well pleased with the mildness of the British

Hindoostan. government, as they are displeased with the superstition and cruelty of the Mohammedans. Under the British government we cannot suppose but that commerce, to which the inhabitants of this country are so much addicted, will be much more encouraged than by the avaricious and barbarous Mohammedans. The latter had imposed so many restraints upon trade of all kinds, by the multitude of taxes collected at the landing-places, watch-houses, markets, &c. that it was almost impossible to carry it on with any advantage. Among other salutary regulations, however, enacted by the British government in 1772, many of those taxes upon commerce were abolished, and a plan laid for effectually liberating the inhabitants from those shackles by which their commerce had been so long fettered.—Regard has also been paid to the instruction of the people in useful knowledge; and the seminary established at Calcutta by Sir William Jones, certainly does much honour to the founder. Some regard had indeed been paid to this by the Mohammedan emperors; but at the time that the British government commenced, these had been entirely neglected, their endowments resumed by government, and even the buildings fallen into ruin.

From a comparison of any government to which the Hindoos have hitherto been subject, with that of Britain, indeed, it is evident that the preference must be given greatly in favour of the latter. At the time when the British first visited that country, they were not under the jurisdiction of their native sovereigns, nor had they been so for a long time before. The Moguls were not only foreigners, but a most cruel and detestable race of men; and it was by usurpations of their own rebellious subjects that the anarchy and confusion was introduced, in which the country was involved for so long a time. The British are foreigners as well as the Moguls; but the latter, who profess the intolerant superstition of Mohammed, suffer their conduct to be influenced by it in such a manner as to treat the natives with the utmost cruelty. The greatest evil perhaps which results from the British government is, the exportation of great sums of money to a foreign country; but this evil, with respect to the provinces possessed by the British, existed also under the Mohammedan government. The Mogul emperors resided at Delhi, which is far distant from the provinces of Bengal, Bahar, and Orissa, the territories now possessed by Britain; so that the greatest part of the treasure sent to that capital was totally lost to them. In the time of Aurengzebe, the emperor's tribute amounted to three millions sterling; and of this a considerable part was specie; but since that time the tribute was fixed at only 1,250,000 l. and even this was a vast sum; to which if we add that carried out of the country by commanders of mercenary troops who were all foreigners, it is not unreasonable to suppose that under the Mogul government matters were still worse, even in this respect, than under that of Britain.

We shall conclude this apology for the British government, with the following extract from the treatise lately quoted, *A short Review of the British Government in India*. "A more detestable or detested race of people never appeared than the Mohammedan conquerors of India; whether we consider the brutality of their passions, the bigotry of their religion, the corruption

Hindustan tion of their manners, the barbarity of their education, or the tyranny of their government: In all these respects they were the terror and abhorrence of the Hindoos, whose country they invaded, and whose dominion they usurped.

"The fanatic ignorance of the savage caliph which dictated his barbarous reason for destroying the Alexandrian library, had neither been tutored nor refined by the Tartar education of Timur and his predecessors. The same superstitious bigotry which incited the Arabian caliphs to destroy the monuments of western learning, likewise impelled the Tartar khans to overthrow the religious temples of the eastern worship. At the commencement of the 11th century Mahmood entered Hindostan, and in the course of 12 expeditions he destroyed the famous temples of Nagracut, Tannasar, Matra, and Sumnaut. In the latter end of the next century, Mahmood Gori penetrated as far as the city of Benares, and committed outrage as Mahmood had done before at Nagracut and Sumnaut. Tamerlane possessed as much of this furious zeal as any of his savage predecessors; and if the enthusiasm of this destructive religion had not occasionally abated among some of his successors, they would scarce have left a Hindoo temple or priest in the country they subdued.

"Enough, however, had been done to fix an indelible stain on the memory of those intolerant tyrants, and to make a lasting impression on the minds of the Hindoos, who, to the latest period of the Mogul government, were kept in constant dread of doctrines, which, to their apprehensions, seemed to inspire the Mohammedans with sacrilegious cruelty. Idolatry is as great an abomination to a Mussulman as it was to the Jews when they most strictly revered the divine command which prohibits it; and most of the Hindoo ceremonies being considered by the Mohammedans as acts of idolatry, and all their pagodas as temples of idols, a religious principle excited mutual sentiments of abhorrence and antipathy between the conquerors and their subjects. The rest of the character of the Mohammedans may be summed up in the concise and emphatic words of Mr Scrafton, who says, 'their distinguishing qualities are perfidy and sensuality.'

"But notwithstanding these facts, and that the history of their government is a disgusting repetition of oppression, massacres, and rebellion, the fashion of the times has been to praise it, and to represent the situation of the Hindoos as easy and happy under it, till they were disturbed in this peaceful state of repose and security by the English; who have been described (with unparalleled injustice) as a set of rapacious task-masters. It surely requires a very small degree of reflection to perceive, that such representations of the two governments must, from the very nature of things, be false.

"The Mohammedan conquerors came into India from a barbarous region, with minds and manners as uncultivated as the wilds from which they issued. The only notion they had of government was absolute power in the sovereign, and absolute submission in the subject. The tenets of their religion, so far from softening the ferocity of their nature, served only to whet the edge of their persecution towards the suffering Hindoos, whom they harassed without mercy, and destroyed without remorse. The British conquerors came from a

country famed for arts and sciences; the generous principles of public liberty had been instilled into their minds from their earliest infancy; the mild tenets of Christianity cherished and commanded every charitable duty; and they had been taught, by precept and example, to rule with equity, and to obey with freedom. Can it be supposed that, under these circumstances, the two nations should have totally changed characters on their coming into India? That the barbarous and ferocious Tartar should become mild and enlightened; that the cultivated and generous Briton should have degenerated into a cruel tyrant; and that the British governors should have rendered the situation of their Hindoo subjects worse than it was under the Mogul emperors? Reason revolts at the idea; and nothing but the rankest prejudice could either suggest or adopt it."

With regard to the geography of this country, Mr Rennel observes, that though by the modern Europeans, Hindostan has been understood to mean the tract situated between the rivers Indus and Ganges on the east and west, the mountains of Thibet and Tartary on the north, and the ocean on the south, the extent of Hindostan, properly so called, is much more circumscribed; and the name ought only to be applied to that part which lies to the northward of 21° or 22° latitude. The reputed southern boundary of Hindostan is the Nerbudda river as far as it goes, and the northern frontiers of Bengal and Bahar compose the remainder. The countries to the south of this line are called *Deccan* by the Indian geographers, and comprehend about one half of the territory generally known by the name of the *Mogul Empire*. Our author therefore chooses to distinguish the northern part by the name of *Hindustan Proper*; which has indeed the Indus and mountains of Thibet and Tartary for its western and northern boundaries; but the Burrampooter river is rather to be considered as the eastern boundary than the Ganges; the latter intersecting some of the richest provinces in the empire. According to this supposition, Hindustan Proper will equal in size the countries of France, Germany, Bohemia, Hungary, Switzerland, Italy, and the Low Countries; the Deccan and peninsula being about equal to the British islands, Spain, and Turkey in Europe.

Towards the north, Hindostan is very cold and barren; but towards the south, very hot, and fertile in corn, rice, fruits, and other vegetables. The northern provinces are very mountainous and sandy; while the southern are for the most part level, and well watered with several rivers.

The most remarkable mountains are those which surround it on three sides. Those on the west, separating it from Persia, called, in general, *Soleyman Kây*, or *the mountains of Soleyman*, are of a vast height as well as breadth, and are only passable in certain places, through which roads have been made for the sake of commerce. The chief are those which lead to Kabul, Gazna, and Kandahar. This great chain of mountains is inhabited by different nations, the principal of which are the Afghans, or Patans, and the Baluches, who have extended themselves on the side of India, as well as Persia. The mountains on the north are called *Nagrakut*, *Hima*, or *Mûs Tâg*, which has an affinity with *Imaûs*, and by other names, which are given also in common to the mountains on each side,

Hindoostan. Separating Hindoostan from Tibet. The very prospect of these mountains is frightful, being nothing but hideous precipices, perpetually covered with snow, and not to be crossed without the greatest danger and difficulty.

The most remarkable rivers of Hindoostan are the Indus and Ganges. The former is called by the orientals, *Send*, *Sind*, or *Sindi*. It rises in the mountains to the north or north-east of Hindoostan; whence, after a long course, first to the south and then to the south-west, it falls into the Persian sea, below Lower Bander, by several mouths. In its course it receives several other large rivers, as the Nilâh, Jamal, Behat, and Lakka.

The Ganges, called in the Indies *Ganga*, rises in the kingdom of Tibet: entering Hindoostan about the 30th degree of latitude, it runs first south-eastward by the cities of Bekâner, Minapor, Halabas, Benâres, and Patna, to Rajah Mahl, where it divides into two branches. The eastern having passed by Dâkka, the capital of Bengal, enters the gulph of that name about Chatigan. The western, descending by Koffum Bazar and Hughly, falls into the gulph below Shandernagor, towards Pipeli.

Many of the Jews and ancient Christians believed this river to be the Pison, one of the four mentioned in scripture as the boundaries of the terrestrial paradise. The Indians retain the greatest reverence for its waters, going in crowds from the remotest parts of the country to wash in them, from a persuasion that they deface from all the spots of sin. The reason of this is, because they imagine this river does not take its source from the bosom of the earth, but descends from heaven into the paradise of Devendre, and from thence into Hindoostan. Nothing is more childish than the fables of the Bramins on this subject, yet the people swallow them all. The Mogul and prince of Golconda drink no other water than that of the Ganges: foreigners, on the contrary, pretend that it is very unwholesome, and that it cannot be safely drank till it is first boiled. There are a great number of superb pagodas on the banks of the Ganges, which are immensely rich. At certain festivals, there has been sometimes a concourse of 100,000 people who came to bathe in it. But what principally distinguishes this river, besides its greatness and rapidity, is the gold it brings down in its sands and throws on its banks; and the precious stones and pearls it produces, not only in itself, but in the gulph of Bengal, into which it discharges its waters, and which abound therewith. The Chun or Jemma, the Guderasu, the Persilis, Lakia, and several other rivers, discharge themselves into it during its course.

The weather and seasons are, for the general, very regular in this spacious country; the winds blowing constantly for six months from the south, and six from the north, with very little variation. The months of April, May, and the beginning of June, till the rains fall, are so extremely hot, that the reflexion from the ground is apt to blister one's face; and but for the breeze or small gale of wind which blows every day, there would be no living in that country for people bred in northern climates; for, excepting in the rainy season, the coldest day is hotter there at noon than the hottest day in England. How-

ever, very surprising changes of heat and cold sometimes happen within a few hours; so that a stifling hot day is succeeded by a night cold enough to produce a thin ice on the water, and that night by a noon as scorching as the preceding. Sometimes, in the dry season, before the rains, the winds blow with such extreme violence, that they carry vast quantities of dust and sand into the air, which appear black, like clouds charged with rain; but fall down in dry showers, filling the eyes, ears, and nostrils of those among whom they descend, and penetrate every chest, cabinet, or cupboard, in the houses or tents, by the key-hole or crevices.

From Surat to Agra, and beyond, it seldom or never rains, excepting in one season of the year: that is, from the middle of June to the middle of September. These rains generally begin and end with most furious storms of thunder and lightning. During these three months it rains usually every day, and sometimes for a week together without intermission: by this means the land is enriched, like Egypt by the Nile. Although the land looks before like the barren sands of the Arabian deserts; yet, in a few days after those showers begin to fall, the surface appears covered with verdure. When the rainy season is over, the sky becomes perfectly serene again, and scarce one cloud appears all the other nine months: however, a refreshing dew falls every night during that dry interval, which cools the air, and cherishes the earth.

The produce of Hindoostan is very rich in every kind, whether it be fossil, vegetable, or animal. Besides other precious stones found in it, there is a diamond-mine at the town of Soumelpûr in Bengal. Quarries of Theban stone are so plentiful in the Mogul's empire, that there are both mosques and pagods built entirely of it. Some travellers tell us, there are mines of lead, iron, and copper, and even silver; but those of the last, if there be any, need not be opened, since the bullion of all nations is sunk in this empire, which will take nothing else in exchange for her commodities, and prohibits the exporting it again. They till the ground with oxen and foot-ploughs, sowing in May and the beginning of June, that all may be over before the rains, and reaping in November and December, which with them is the most temperate months in the year. The land is no where inclosed, excepting a little near towns and villages. The grass is never mowed to make hay, but cut off the ground, either green or withered, as they have occasion to use it. Wheat, rice, barley, and other grain, grow here in plenty, and are very good. The country abounds no less in fruits, as pomegranates, citrons, dates, grapes, almonds, and cocoa-nuts; plums, those especially called *mirabolans*; plantanes, which in shape resemble a slender cucumber, and in taste excel a Norwich pear; mangos, an excellent fruit, resembling an apricot, but larger; ananas or pine-apples; lemons and oranges, but not so good as in other countries; variety of pears and apples in the northern parts; and the tamarind-tree, the fruit of which is contained in a pod resembling those of beans. There are many other kinds of fruit-trees peculiar to the country. But the valuable trees are the cotton and mulberry, on account of the wealth they bring the natives from the manufactures of calicoes and silks. They plant abundance of sugar-

Hindostan canes here, as well as tobacco; but the latter is not so rich and strong as that of America, for want of knowing how to cure and order it.

||
Hinnom.

Hindostan affords also plenty of ginger, together with carrots, potatoes, onions, garlic, and other roots known to us, besides small roots and herbs for salads; but their flowers, though beautiful to look at, have no scent, excepting roses, and some few other kinds.

There is a great variety of animals in this country, both wild and tame; of the former are elephants, rhinoceroses, lions, tygers, leopards, wolves, jackals, and the like. The jackals dig up and eat dead bodies, and make a hideous noise in the night. The rhinoceros is not common in the Mogul's empire; but elephants are very numerous, some 12, 14, or 15 feet high. There is plenty of venison, and game of several kinds; as red-deer, fallow-deer, elks, antelopes, kids, hares, and such like. None of these are imparked, but all in common, and may be any body's who will be at the pains to take them. Among the wild animals also may be reckoned the musk-animal, apes, and monkeys.

Hindostan affords variety of beasts for carriage, as camels, dromedaries, mules, asses, horses, oxen, and buffaloes. Most of the horses are white, and many curiously dappled, pied, and spotted all over. The flesh of the oxen is very sweet and tender. Being very tame, many use them as they do horses to ride on. Instead of a bit, they put one or two small strings through the gristle of the nostrils, and fastening the ends to a rope, use it instead of a bridle, which is held up by a bunch of gristly flesh which he has on the forepart of his back. They saddle him as they do a horse; and, if spurred a little, he will go as fast. These are generally made use of all over the Indies; and with them only are drawn waggons, coaches, and chariots. Some of these oxen will travel 15 leagues in a day. They are of two sorts; one six feet high, which are rare; another called *dwarfs*, which are only three. In some places, where the roads are stony, they shoe their oxen when they are to travel far. The buffalo's skin makes excellent buff, and the female yields very good milk; but their flesh is neither so palatable nor wholesome as beef. The sheep of Hindostan have large heavy tails, and their flesh is very good, but their wool coarse.

This country is much infested with reptiles and insects; some of a noxious kind, as scorpions, snakes, and rats; but the lizards, which are of a green colour, are not hurtful. Snakes and serpents, we are told, are sometimes employed to dispatch criminals, especially such as have been guilty of some atrocious crime, that kind of death being attended with the most grievous torture. The most troublesome insects in this hot country are flies, musketoes, and chinchies or bugs, the first by day, and the others in the night; when they offend no less by their stench than their bite.

HINE, or HIND, a husbandman's servant. Thus the person who oversees the rest, is called the master's hine.

HINNOM, or the Valley of HINNOM, (anc. geog.), a place that lay to the south of Jerusalem. It was also called the valley of Tophet, and was remarkable for the cruel and barbarous worship of the god Moloch,

where parents made their children pass through the fire in honour of that idol.

HIP, in the materia medica, the fruit of the dog-rose or wild brier. See ROSA.—They contain a fourish sweetish pulp; with a rough prickly matter inclosing the seeds, from which the pulp ought to be carefully separated before it be taken internally: the Wirtemberg college observes, that from a neglect of this caution, the pulp of hips sometimes occasions a pruritus and uneasiness about the anus; and the conserve of it has been known to excite violent vomiting. The conserve is the only officinal preparation of this fruit. And as it is not supposed to possess any particular medical virtue, but is merely used to give form to other articles, the Edinburgh college have, perhaps without any material disadvantage, entirely omitted it.

HIPPARCHUS, a great astronomer, born at Nice in Bithynia, flourished between the 154th and 163d Olympiads. His commentary upon Aratus's phenomena is still extant. Rohault was very much mistaken when he asserted, that this astronomer was not acquainted with the particular motion of the fixed stars from west to east, by which their longitude changes. By foretelling eclipses, he taught mankind not to be frightened at them, and that even the gods were bound by laws. Pliny, who tells this, admires him for making a review of all the stars; by which his descendants would be enabled to discover whether they are born and die, whether they change their place, and whether they increase and decrease.

HIPPJA, in botany; a genus of the polygamia necessaria order, belonging to the syngenesia class of plants. The receptacle is naked; there is no pappus; the seeds are naked, with very broad margins; the calyx is hemispheric, and subimbricated; the radius consists of ten corollulæ, obscure, and rather cleft into three.

HIPPOBOSCA, or HORSE-FLY, in zoology; a genus of insects, belonging to the order of diptera. The beak consists of two valves, is cylindrical, obtuse, and hanging; and the feet have several claws. There are four species, distinguished by their wings, &c. The most remarkable is the equina, the pest of horses and cows. This insect is broad, flat, shining, and as it were scaly. Its head, thorax, and abdomen, are yellow, undulated with brown; and the legs are intersected with yellow and brown. The wings, crossed one over the other, exceed the length of the body by above one half; they are transparent, tinged with a little yellow towards their outward edge, and have a spot near that edge of a brown colour. These insects are very difficult to be killed on account of the hard crustaceous shell which covers them; and they fix so close and fast to the poor animals with their claws, that they cannot rub or bite them off without wounding themselves.

HIPPOCAMPUS, in ichthyology. See SYN-GNATHUS.

HIPPOCASTANUM, or common horse-chestnut. See ÆSCULUS.—It may be here added, that from several experiments in the French *Memoires d'Agriculture*, it appears that the fruit of the horse-chestnut affords a wholesome nourishment for cattle, and may even be employed with success for fattening them. It is said to render the tallow of those fattened with it particularly

tes.

larly firm. The milk yielded by cows fed upon it, is also said to be thicker and richer than that produced from any other kind of food.—The fruit of this tree has been likewise used as food for sheep and poultry, and as soap for washing. It was much employed in powder as a sternutatory by an itinerant oculist, and has been recommended by some others in certain states of ophthalmia, headach, &c. in which errhines are indicated. Its effects as a sternutatory may also be obtained by using it under the form of infusion or decoction drawn up into the nostrils. And it is entirely with a view to its errhine power that it is now introduced into the pharmacopœia of the Edinburgh college. But besides this, the bark has also been represented by some as a cure for intermittent fevers; and it is probably with this intention that this part of the hippocastanum is introduced as an officinal article in the Pharmacopœia Rossica.

HIPPOCENTAUR (formed of ἵππος "horse," κεντῖον *pungo*, "I spur," and ταύρος "bull," in antiquity, a fabulous monster, supposed to be half horse and half man.

What gave occasion to the fable was, that a people of Thessaly, inhabiting near mount Pelion, became thus denominated, because they were the first that taught the art of mounting on horseback; which occasioned some of their neighbours to imagine, that the horse and man made but one animal.

The hippocentaurs should seem to have differed from the centaurs, in this, that the latter only rode on bullocks, and the former on horses, as the names themselves intimate.

HIPPOCRAS, a medicinal drink, composed of wine, with spices and other ingredients infused therein; much used among the French by way of a cordial dram after meals.

There are various kinds of hippocras, according to the kind of wine and the other additional ingredients made use of; as white hippocras, red hippocras, claret hippocras, strawberry hippocras, hippocras without wine, cyder hippocras, &c.

That directed in the late London Dispensary, is to be made of cloves, ginger, cinnamon, and nutmegs, beat and infused in canary with sugar; to the infusion, milk, a lemon, and some slips of rosemary, are to be put, and the whole strained through a flannel. It is recommended as a cordial, and as good in paralytic and all nervous cases.

HIPPOCRATIA, in botany: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is quinquepartite; the petals five, the capsules three in number, and the latter of an obcordate shape.

HIPPOCRATES, the greatest physician of antiquity, was born in the island of Cos in the 80th Olympiad, and flourished at the time of the Peloponnesian war. He was the first that we know of who laid down precepts concerning physic; and, if we may believe the author of his life, who goes under the name of *Soranus*, drew his original from Hercules and Æsculapius. He was first a pupil of his own father Heraclides, then of Herodicus, then of Gorgias of Leontium the orator, and, according to some, of Democritus of Abdera. After being instructed in physic, and in the liberal arts,

and losing his parents, he left his own country, and practised physic all over Greece; where he was so much admired for his skill, that he was publicly sent for with Euryphon, a man superior to him in years, to Perdiccas king of Macedonia, who was then thought to be consumptive. But Hippocrates, as soon as he arrived, pronounced the disease to be entirely mental, as in truth it was. For upon the death of his father Alexander, Perdiccas fell in love with Philas, his father's mistress: and this Hippocrates discerning by the great change her presence always wrought upon him, a cure was soon effected.

Being intreated by the people of Abdera to come and cure Democritus of a supposed madness, he went; but, upon his arrival, instead of finding Democritus mad, he found all his fellow citizens so, and Democritus the only wise man among them. He heard many lectures, and learned much philosophy from him; which has made Cornelius Celsus and some others imagine, that Hippocrates was the disciple of Democritus, though it is probable they never saw each other till this interview which was occasioned by the Abderites. Hippocrates had also public invitations to other countries. Thus, when a plague invaded the Illyrians and Pæonians, the kings of those countries begged him to come to their relief: he did not go; but learning from the messengers the course of the winds there, he concluded that the distemper would come to Athens; and, foretelling what would happen, applied himself to take care of the city and the students. He was indeed such a lover of Greece, that when his fame had reached as far as Persia, and upon that account Artaxerxes had intreated him by his governor of the Hellespont, with a promise of great rewards, to come to him, he refused to go. He also delivered his own country from a war with the Athenians, that was just ready to break out, by prevailing with the Thessalians to come to their assistance, for which he received very great honours from the Coans. The Athenians also conferred great honours upon him: they admitted him next to Hercules in the Elusian ceremonies; gave him the freedom of the city; and voted a public maintenance for him and his family in the prytæum or council-house at Athens, where none were maintained at the public charge but such as had done signal service to the state. He died among the Larissæans, some say in his 90th year, some in his 85th, others in his 104th, and some in his 109th. The best edition of his works is that of Foesius, in Greek and Latin. Hippocrates wrote in the Ionian dialect. His aphorisms, prognostics, and all that he has written on the symptoms of diseases, justly pass for master-pieces. See *HISTORY OF MEDICINE*.

HIPPOCRENE (anc. geog.), a fountain of mount Helicon, on the borders of Bœotia, sacred to the Muses. Some, as Ovid, make Hippocrene and Aganippe the same. See AGANIPPE.

HIPPOPHAGI (anc. geog.), a people of Scythia, so called from their living on horse-flesh: the fare at this day of the Tartars their descendants. Also a people of Persia (Ptolemy).

HIPPOCREPIS, COMMON HORSE-SHOE VETCH, in botany: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The legumen is compressed and crooked, with many

Hippocra-
tes
||
Hippocre-
pis.

Hippo-
drome
||
Hippoly-
tus.

incisions on the interior surface. There are three species, two natives of the warm parts of Europe, and one of Britain. They are all low herbaceous trailing plants, with yellow flowers. They are propagated by seeds; but having no great beauty are seldom kept in gardens.

HIPPODROME, HIPPODROMUS (composed of ἵππος "horse," and δρόμος "course," of the verb δρέμω *curro*, "I run"), in antiquity, a list or course wherein chariot and horses races were performed, and horses exercised.

The Olympian hippodrome or horse-course was a space of ground of 600 paces long, surrounded with a wall, near the city Elis, and on the banks of the river Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part was a hill of a moderate height, and the circuit was adorned with temples, altars, and other embellishments. See **STADIUM**. There is a very famous hippodrome at Constantinople, which was begun by Alexander Severus, and finished by Constantine. This circus, called by the Turks *atmeican*, is 400 paces long, and above 100 paces wide. At the entrance of the hippodrome there is a pyramidal obelisk of granite in one piece, about 50 feet high, terminating in a point, and charged with hieroglyphics. The Greek and Latin inscriptions on its base show, that it was erected by Theodosius; the machines that were employed to raise it are represented upon it in basso-relievo. We have some vestiges in England of the hippodromus, in which the ancient inhabitants of this country performed their races; the most remarkable is that near Stonehenge, which is a long tract of ground, about 350 feet, or 200 druid cubits wide, and more than a mile and three quarters, or 6000 druid cubits in length, inclosed quite round with a bank of earth, extending directly east and west. The goal and career are at the east end. The goal is a high bank of earth, raised with a slope inwards, on which the judges are supposed to have sat. The metae are two tumuli, or small barrows, at the west end of the course. These hippodromes were called in the language of the country *rhedagua*, the racer *rhedagur*, and the carriage *rheda*, from the British word *rhedeg* "to run." One of these hippodromes, about half a mile to the southward of Leicester, retains evident traces of the old name *rhedagua*, in the corrupted one of *rawdikes*. There is another of these, says Dr Stukeley, near Dorchester; another on the banks of the river Lowther, near Penrith in Cumberland; and another in the valley, just without the town of Royston.

HIPPOGLOSSUS, in ichthyology; a species of **PLEURONECTES**.

HIPPOLYTUS, a son of Theseus and Hippolyte, famous in fabulous history for his virtue and his misfortunes. His stepmother Phædra fell in love with him, and when he refused to pollute his father's bed, she accused him to Theseus of offering violence to her person. Her accusation was readily believed, and Theseus intreated Neptune to punish the incontinence of his son. Hippolytus fled from the resentment of his father; and as he pursued his way along the sea shores, his horses were so frightened at the noise of sea calves which Neptune had purposely sent there, that they ran among the rocks till his chariot was broken and his

body torn to pieces. Temples were raised to his memory, particularly at Trœzene, where he received divine honours. According to some accounts, Diana restored him to life.

HIPPOMANE, the **MANCHINEEL-TREE**: A genus of the adelphia order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, *Tricocca*. The male has an amœtum and bifid perianthium, without any corolla; the female perianthium is trifid; there is no corolla; the stigma is tripartite; and the plum or capsule trilocous.

Species. 1. The *mancinella*, with oval sawed leaves, is a native of all the West India islands. It hath a smooth brownish bark; the trunk divides upward into many branches, garnished with oblong leaves about three inches long. The flowers come out in short spikes at the end of the branches, but make no great appearance, and are succeeded by fruit of the same shape and size with a golden pippin. The tree grows to the size of a large oak. 2. The *biglandulosa*, with oblong bay leaves, is a native of South America; and grows to as large a size as the first, from which it differs mostly in the shape of its leaves. 3. The *spinosa*, with holly leaves, is a native of Campeachy, and seldom rises above 20 feet high; the leaves greatly resemble those of the common holly, and are set with sharp prickles at the end of each indenture. They are of a lucid green, and continue all the year.

Culture. These plants being natives of very warm climates, cannot be preserved in this country without a stove; nor can they by any means be made to rise above five or six feet high even with that assistance. They are propagated by seeds; but must have very little moisture, or they will certainly be killed by it.

Properties. These trees have a very poisonous quality, abounding with an acrid milky juice of a highly caustic nature. Strangers are often tempted to eat the fruit of the first species; the consequences of which are, an inflammation of the mouth and throat, pains in the stomach, &c. which are very dangerous unless remedies are speedily applied. The wood is much esteemed for making cabinets, book-cases, &c. being very durable, taking a fine polish, and not being liable to become worm-eaten; but as the trees abound with a milky caustic juice already mentioned, fires are made round their trunks, to burn out this juice; otherwise those who fell the trees would be in danger of losing their sight by the juice flying in their eyes. This juice raises blisters on the skin wherever it falls, turns linen black, and makes it fall out in holes. It is also dangerous to work the wood after it is sawn out; for if any of the saw-dust happens to get into the eyes of the workmen, it causes inflammations and the loss of sight for some time; to prevent which, they generally cover their faces with fine lawn during the time of working the wood. It is with the juice of this tree that the Indians used to poison their arrows.

HIPPOMANES, a sort of poison famous among the ancients as an ingredient in amorous philters or love-charms. The word is Greek. ἵππομανης, composed of ἵππος "a horse," and μανία "fury or madness."

Authors are not agreed about the nature of the hippomanes. Pliny describes it as a blackish caruncle found on the head of a new-born colt; which the dam bites.

Hippo-
mane,

tamus.

bites off and eats as soon as she is delivered. He adds, that if she be prevented herein by any one's cutting it off before, she will not take to nor bring up the young. Virgil, and after him Servius and Columella, describe it as a poisonous matter trickling from the pudendum of a mare when proud, or longing for the horse. At the end of Mr Bayle's Dictionary is a very learned dissertation on the hippomanes, and all its virtues both real and pretended.

HIPPONAX, a Greek poet, born at Ephesus 540 years before the Christian era. He cultivated the same satirical poetry as Archilochus, and was not inferior to him in the beauty or vigour of his lines. His satirical raillery obliged him to fly from Ephesus. As he was naturally deformed, two brothers, Buphalus and Anthernus, made a statue of him; which, by the ugliness of its features, exposed the poet to universal ridicule. Hipponax resolved to revenge the injury; and he wrote such bitter invectives and satirical lampoons against them, that they hanged themselves in despair. (*Cic. ad Famil. vii. ep. 24.*)

HIPPOPHAE, SEA-BUCKTHORN: A genus of the tetrandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 16th order, *Calycifloræ*. The male calyx is bipartite; there is no corolla; the female calyx is bifid; there is no corolla; there is one style, and a monospermous berry.

Species. 1. The rhamnoides hath a shrubby stem, branching irregularly eight or ten feet high, having a dark brown bark. It is armed with a few thorns; hath spear-shaped, narrow, sessile leaves, of a dark green above, and hoary underneath. 2. The canadensis hath a shrubby brown stem, branching eight or ten feet high, with oval leaves, and male and female flowers on different plants.

Culture, &c. Both these species are very hardy, and may be propagated in abundance by suckers from the roots, by layers, and by cuttings of their young shoots. They are retained in gardens on account of their two-coloured leaves in summer; and in winter, on account of the appearance of the young shoots, which are covered with turgid, irregular, scaly buds. Goats, sheep, and horses, eat the first species; cows refuse it.

HIPPOPODES, HIPPOPEDES, or *Hippopodia*, composed of *ἵππος* horse, and *πούς* foot, in the ancient geography, an appellation given to a certain people situated on the banks of the Scythian sea, as being supposed to have had horses feet. The hippopodes are mentioned by Dionysius, Geogr. v. 310. Mela, lib. iii. cap. 6. Pliny, lib. iv. cap. 13. and St Augustine, *De Civit.* lib. xvi. cap. 8. But it is conjectured, that they had this appellation given them on account of their swiftness or lightness of foot. Mr Pennant supposes them to have been the inhabitants of the Bothnian Gulph, and that they were the same sort of people as the *Finni Lignipedes* of Olaus. They wore snow-shoes; which he thinks might fairly give the idea of their being, like horses, hoofed and shod.

HIPPOPOTAMUS, the RIVER-HORSE; a genus of quadrupeds belonging to the order of belluæ, the characters of which are these: It has four fore-teeth in the upper jaw, disposed in pairs at a distance from each other; and four prominent fore-teeth in the under jaw,

Nº 154.

the intermediate ones being longest: There are two tusks in each jaw, those of the under one very long and obliquely truncated; in both they stand solitary, and are recurvated: The feet are hoofed on the edges.

There is but one known species, viz. the amphibius, or river-horse, (Plate CCXXXVI.) The head of this animal is of an enormous size, and the mouth vastly wide. The ears are small and pointed, and lined within very thickly with short fine hairs. The eyes and nostrils are small in proportion to the bulk of the animal. On the lips are some strong hairs scattered in patches here and there. The hair on the body is very thin, of a whitish colour, and scarce discernible at first sight. There is no mane on the neck, as some writers feign, only the hairs on that part are rather thicker. The skin is very thick and strong, and of a dusky colour. The tail is about a foot long, taper, compressed, and naked. The hoofs are divided into four parts. The legs are short and thick. In bulk it is second only to the elephant. The length of a male has been found to be 17 feet, the circumference of the body 15, the height near 7, the legs near 3, the head above $3\frac{1}{2}$, and the girth near 9. The mouth, when open, is above 2 feet wide; and furnished with 44 teeth of different figures (including the cutting teeth and the canine). The cutting, and particularly the canine teeth of the lower jaw, are very long; and so hard and strong that they strike fire with steel. This circumstance, it is probable, gave rise to the fable of the ancients, that the hippopotamus vomited fire from his mouth. The substance of the canine teeth is so white, so fine, and so hard, that it is preferable to ivory for making artificial teeth. The cutting teeth, especially those of the under jaw, are very long, cylindrical, and chamfered. The canine teeth are also long, crooked, prismatic, and sharp, like the tusks of the wild boar. The grinders are square or oblong, like those of man, and so large that a single tooth sometimes weighs three pounds. The tusks, according to Dr Sparman, are 27 inches long.—With such powerful arms, and such a prodigious strength of body, the hippopotamus might render himself formidable to every other animal. But he is naturally of a mild disposition, and is only formidable when provoked. His bulk is so great, that twelve oxen have been found necessary to draw one ashore which had been shot in a river above the Cape; and Hasselquist says, its hide is a load for a camel. Tho' he delights in the water, and lives in it as freely as upon land; yet he has not, like the beaver or otter, membranes between his toes. The great size of his belly renders his specific gravity nearly equal to that of water, and makes him swim with ease.

These animals inhabit the rivers of Africa, from the Niger to Berg River, many miles north of the Cape of Good Hope. They formerly abounded in the rivers nearer the Cape, but are now almost extirpated; and to preserve the few which are left in Berg River, the governor has absolutely prohibited the shooting them without particular permission.—They are not found in any of the African rivers which run into the Mediterranean except the Nile, and even there only in Upper Egypt, and in the fens and lakes of Ethiopia which that river passes through. From the unwieldiness of his body and the shortness of his legs, the hippo-

Hippopo-
tamus.

Hippopotamus is not able to move fast upon land, and is then extremely timid. When pursued, he takes to the water, plunges in, sinks to the bottom, and is seen walking there at full ease: he cannot, however, continue there long without often rising towards the surface; and in the daytime is so fearful of being discovered, that when he takes in fresh air the place is hardly perceptible, for he does not venture even to put his nose out of the water. In rivers unfrequented by mankind, he is less cautious, and puts his whole head out of the water. If wounded, he will rise and attack boats or canoes with great fury, and often sink them by biting large pieces out of the sides: and frequently people are drowned by these animals; for they are as bold in the water as they are timid on land. It is reported that they will at once bite a man in two.—In shallow rivers the hippopotamus makes deep holes in the bottom, in order to conceal his great bulk. When he quits the water, he usually puts out half his body at once, and smells and looks around; but sometimes rushes out with great impetuosity, and tramples down every thing in his way.—During the night he leaves the rivers in order to pasture; when he eats sugar-canes, rushes, millet, rice, &c. consuming great quantities, and doing much damage in the cultivated fields. But as he is so timid on land, it is not difficult to drive him off.—The Egyptians (Mr Hasselquist informs us) “have a curious manner of freeing themselves in some measure from this destructive animal. They remark the places he frequents most, and there lay a large quantity of pease: when the beast comes on shore hungry and voracious, he falls to eating what is nearest him; and filling his belly with the pease, they occasion an unsupportable thirst: he then returns immediately into the river, and drinks upon these dry pease large draughts of water, which suddenly causes his death; for the pease soon begin to swell with the water, and not long after the Egyptians find him dead on the shore, blown up, as if killed with the strongest poison.” The river-horse also feeds on the roots of trees, which he loosens with his great teeth; but never eats fish, as is asserted by Dampier. It was reported to Mr Hasselquist, that the river-horse is an inveterate enemy to the crocodile, and kills it whenever he meets it: and that this, with some other reasons, contributes much to the extirpation of the crocodile; which otherwise, considering the many eggs they would lay, would utterly destroy Egypt. But Mr Pennant treats the alleged enmity of the hippopotamus and crocodile as a vulgar error; an eye-witness, he tells us, declaring he had seen them swimming together without any disagreement.—The hippopotami sleep in the reedy islands in the middle of the stream, and on which they bring forth their young. A herd of females has but a single male: they bring one young at a time, and that on the land, but suckle it in the water.—They are capable of being tamed. Belon says, he has seen one so gentle as to be let loose out of a stable and fed by its keeper without attempting to injure any one. They are generally taken in pitfalls, and the poor people eat the flesh. In some parts the natives place boards full of sharp irons in the corn-grounds; which these beasts strike into their feet, and so become an easy prey. Sometimes they are struck in the water with harpoons fastened to cords, and 10 or 12 canoes are employed in the chase.

VOL. VIII. Part II.

The hippopotamus was known to the Romans: Scaurus treated the people with the sight of five crocodiles and one hippopotame during his ædileship, and exhibited them in a temporary lake. Augustus produced one at his triumph over Cleopatra.

This animal is the behemoth of Job; who admirably describes its manners, food, and haunts. “1. Behold now behemoth, which I made near thee: he eateth grass as an ox. 2. Lo! now his strength is in his loins, and his force is in the navel of his belly. 3. His bones are as strong pieces of brass; his bones are like bars of iron. 4. He lieth under the shady trees, in the covert of the reed and fens. 5. Behold! he drinketh up a river: he trusteth he can draw up Jordan into his mouth.” The first, the learned Bochart observes, implies the locality of its situation; being an inhabitant of the Nile, in the neighbourhood of Uz, the land of Job. The second describes its great strength; and the third, the peculiar hardness of its bones. The fourth indicates its residence amidst the vast reeds of the river of Egypt, and other African rivers overshadowed with thick forests. The fifth, the characteristic wideness of its mouth; which is hyperbolically described as large enough to exhaust such a stream as Jordan.

That this article may include every sort of information which could be collected concerning a creature so highly noted and of such ancient fame, we shall add the following particulars, extracted from Sparman’s Voyage to the Cape of Good Hope, where these animals are called *sea-cows*.

“Towards evening (Jan. 24. 1776), we came to a pit in the river, which our guides knew used to be frequented by sea-cows. For this reason, all the different ways by which these animals might come up from the river, were beset by us separately; our hunting-party consisting in the whole of seven persons, *viz.* five of us Christians, together with my Hottentot and another belonging to the farmers. Besides this, the rest of the Hottentots were ordered to go to the windward and to the more open places; and by smacking their whips, and making other noises, to frighten and drive the animal towards us as soon as it should make its appearance: in consequence of which measures, it appeared to us, that when at length obliged to go on shore in quest of its food, it must necessarily come to the hiding-place of some one of the hunters. Every one of these places were just at the edge of the river, between the reeds which grew on the dry parts of the river, or on those spots which the water had left, and at the same time close to the very narrow paths which the animal had made for itself at each place: in consequence of which disposition, it would inevitably pass not above six inches, or a foot at most, from the mouth of the sportsman’s piece. Consequently our whole dependence was upon two circumstances; *viz.* that our guns should not miss fire, and that the shot should not fail to prove mortal. In the former case, the sportsman must have inevitably paid for his temerity with his life; though in the latter he had reason to hope, from instances of what had happened to others, that the fire, together with the report from the piece, as well as the ball itself, would confuse the animal, so as to prevent it from immediately making towards its enemy. The banks of the pit which we then beset

3 Y were

Hippopotamus.

were in most places steep and perpendicular, and the pit itself was almost three quarters of a mile long: but my post and that of my fellow-traveller (Mr Immelman) happened to be at the distance of not above 30 or 40 paces from each other. To these very places too, after we had waited at them an hour and an half in the most profound silence, the enormous animals did not fail to resort. They had already, while on the other side of the river, got scent of the Hottentots; and now showed by their swimming up and down and blowing themselves, as well as by a short but acute and piercing grunt or neighing noise, that they had a great suspicion of these passes. I believe Mr Immelman was not less eager and anxious than myself, each of us expecting every moment to have a bout with a huge enormous beast which we knew had given certain proofs of its being able to bite a man asunder. Yet were we each of us at times no less fearful lest the other should have the honour of killing game of such consequence. The hippopotamus, however, left us, and had made its appearance in the same manner where the farmers were stationed; notwithstanding which, at that very instant we heard it shot at by one of the Hottentots.—The fable darkness of the night, and the glittering of the Hottentot's piece, together with the loudness of the report from it, occasioned by the weight of the charge, and the vibrations of the echo prolonging the sound along the neighbouring chain of mountains, all conspired to compose a most awful and superb spectacle, which was still heightened by the expectation of seeing an animal fall superior in bulk to the elephant. This sublime spectacle was immediately followed by a ridiculous kind of farce performed by a troop of baboons; which, from their calling and answering each other along a straight line, we could discover to be encamped on a steep rocky mountain in the neighbourhood, with regular out-posts in the trees on each side of it. After an interval of a couple of minutes, silence again took place, till two o'clock, when the other Hottentot fired his piece; and another alarm, though of shorter duration, went through the baboons out-posts and head-quarters.

“The next morning, for the arrival of which we ardently longed, in order to satisfy our curiosity, our Hottentot sportsmen related to us the following particulars concerning the adventures of the night. Involved in darkness, covered up to the eyes in reeds, and overshadowed with branches of trees, they could only get a glimpse of the animal, and consequently could not answer for their shots having taken place: and one of them acknowledged, that he was a little confused, as he could not well see what he was about; and for the same reason fired his piece too soon, before the animal had well risen out of the water. The other indeed had had an opportunity, both with the ball and shot that made up the charge, of wounding the animal, which went on its road, and passed directly by him; but he could not see which part of the animal presented itself before the muzzle of his piece. As soon as he had fired, he slunk away, and directly afterwards heard the beast take to the water. The rest of the Hottentots had observed one of these animals, probably a different one from this, run up on a shallow along the river side, and thus make its escape, without their having been able to prevent it. After this we staid here till the afternoon, in

hopes that the wounded animals would die and rise to the top of the water. But we staid in vain; and to as little purpose would it probably have been had we waited still longer, as there grew by the side of the river a great number of trees, to the roots of which these creatures, it is said, in the agonies of death, make themselves fast by means of their long and crooked tusks. On the other hand, supposing these two sea-cows to be but slightly wounded, they would be cautious how they made their appearance; and indeed, in all probability, it would have been a dangerous service to the sportsmen who should have ventured to have followed them any farther. Besides, the water had now, in the space of a few hours, risen considerably, and had overflowed many spots fit for lying in ambush; for which reason we departed to another hippopotamus-pit less than this. Here too we laid, by way of snare, a large blunderbuss. The Hottentots occupied one post; two of our company guarded another; other two (an old farmer and his son) stationed themselves at the third, and placed me in the middle of them. Just in this part the banks of the river were of a considerable height, and the river itself was dried up near an extensive shallow, where it was spread out into a little plain covered with pebble-stones and gravel. We three then set ourselves down close by the side of each other, in a path made by the sea-cows, making ourselves pretty certain, as the place was flat, and consequently it was light here, of being able, if any hippopotamus should chance to come upon the shallow and look about it, to see it plain enough to kill it with a volley of three shot. But, to the great endangering of our lives, we on a sudden found the animal much quicker in its motions, as well as bolder, than we had thought it: for while I was sitting half asleep, and moralizing on the subject, struck with the consideration that we with our guns had at that present moment the dominion over Job's leviathan or behemoth; while, on the other hand, the flies or small musquitos had the dominion over us (so much, indeed, that I was obliged to wrap my face up in a handkerchief), a sea-cow came rushing upon us out of the river, with a hideous cry, as swift as an arrow out of a bow; at the same time I heard the farmer call out, “Heer Jesus!” But fortunately at the very instant he discharged his piece, which flashing full in the animal's face contributed perhaps more than the ball to make it start back; when setting up another cry, it threw itself into the water again with as great precipitation as it came out.

“At this I was not a little alarmed; yet, what is very singular, not at the danger, which was real, of being trampled under foot, or being bitten asunder by the beast, but in consequence of my apprehensions, which were merely imaginary, of being drowned: for the rattling noise, arising from the creature's running out of the water and along the stoney beach, immediately suggested to me the idea that the river had on a sudden overflowed its banks; a supposition to which I was the more inclined, as I knew that this accident happens very frequently here. And as the hippopotamus, when it is newly come up out of the water, and is wet and slimy, is said to glisten in the moon-shine like a fish, it is no wonder that as soon as I took my handkerchief from before my eyes, it should appear to

me,

Hippopota-
mus.

me, at so near a view as I had of it, like a high column of water, which seemed to threaten to carry us off and drown us in a moment: for which reason I ran, or rather flew, towards the higher ground, leaving both my guns and my brother sentinels behind me. But as just at this spot I was prevented by the steepness of the river's banks from ascending the heights, and nevertheless perceived that neither my companions nor myself were drowned, it ran in my head, for the space of several seconds, that we were all of us either dreaming or delirious. The farmer's son had fallen asleep, and still continued to sleep very soundly. As to the farmer himself, who, panting and breathless, every now and then looked up to heaven, and at the same time, with much awkwardness and bustle, was endeavouring to make his escape, I made all the haste I could to disengage him from a large wrapper, which, as well on account of his gout as by way of keeping off the flies, he had wrapped round his legs. I then asked him what course the water had taken when it overflowed? and he, after a long pause, answered only by asking me in his turn if I was not mad? upon which I was almost ready to put the same question to myself. And even at last, when all this was unriddled to me, I could not help doubting of the truth of it, till I found the farmer's gun was really discharged: for the rattling among the stones and the squashing in the water, occasioned by the sea-cow, was what I first heard, and what made me take to my legs; so that I did not attend in the least either to the report of the gun or the cry of the animal, though these latter appeared to the rest of our party the most terrible: so much, indeed, that they occasioned Mr Immelman, together with the farmer's son-in-law, to fly from their post; though they had seen nothing of all that had happened, and could not easily have come to any harm.—We concluded the chace; and spent the remainder of the night in laughing at each other, in chattering, and forming various conjectures on the subject of the precipitation and impetuous fury of the sea-cow; which, however, was probably as much alarmed and frightened as we ourselves could possibly be: we even smoked a couple of pipes while we listened to the roaring of the lion, and waited for the approach of the morning. Several Hottentots then told us, that soon after the noise and tumult we have been describing had ceased, they had seen a sea-cow making its way out of the river towards that side of it which was unguarded.

“On the 25th, from some traces of the sea-cows which we found in the dust near another spot, we concluded that many of these huge amphibious animals had lately taken up their quarters in a certain pit thereabouts; which we accordingly prepared to lay siege to in every possible way. In the mean time, we saw a young lion make its escape into a close thicket on the side of this same pit, where it might be perfectly safe from us and our hounds. Not much approving of this animal's being so near a neighbour to us, we thought it best for several of us marksmen to be together at each hiding-place; at the same time ordering our Hottentots, partly by making a noise and uproar, and partly by the means of making large fires, to frighten the sea-cows from attempting any of the other passes. These animals had probably been beset in the same manner several times before, as this

night we scarcely heard any thing of them. In the mean while, however, we flattered ourselves, that by continuing to block them up, we should at least by starving them force them to quit their asylum, and expose themselves on the land to the fire of our guns.

“On the 26th likewise we were on the look-out after these animals, between the hours of ten and eleven in the forenoon, and also just before dusk, though upon a quite different plan from what we had before, as we meant now to hit them on their snouts the instant they should stick them up within the reach of our guns out of the water in order to take breath, or more properly (as it is not unaptly called by the colonists) to blow themselves. In order that the shot might prove mortal, we were obliged, however, on this occasion, to direct it in such a manner, that the ball should pass through the cavity of the nose into the brain. It was merely upon this plan that we went out after the sea-cows before we arrived at *Agter Brunjes-hoogte*, and were strengthened by the farmer's party. But we constantly found these animals too shy to allow us to put our designs in execution: for although, in those places where they had not been frightened or wounded, they will often in the middle of the day raise their heads and part of their bodies above the surface of the water, they at this time scarcely ventured just to put one of their nostrils only out of it, in order to breathe almost imperceptibly; and this only for the most part in those spots in which they were sheltered from us by the hanging branches of trees. Notwithstanding this disadvantageous situation, they, in consequence of the acuteness of their smell, seemed still to discern us, especially when we were to the windward of them; as in that case they instantly withdrew to another part.

“The same night we betook ourselves again to our posts; and at half an hour after eight, it being already very dark, a sea-cow began at intervals to put its head up above the water, and utter a sharp, piercing, and, as it were, a very angry cry, which seemed to be between grunting and neighing. Perhaps this cry may be best expressed by the words *hëurkh hurkh, hüh-hüh*: the two first being uttered slowly, in a hoarse but sharp and tremulous sound, resembling the grunting of other animals; while the third, or compound word, is sounded extremely quick, and is not unlike the neighing of a horse. It is true, it is impossible to express these inarticulate sounds in writing; but perhaps one may make nearer approaches to it than one can to the guttural sounds of the Hottentot language. At eleven o'clock came the same or else some other hippopotamus, and in like manner visited the posts we occupied. He did not, however, dare to come up, though to our extreme mortification we heard him come and nibble the boughs which hung over the surface of the water, as well as a little grass and a few low shrubs which grew here and there on the inside of the river's banks. We were, however, in hopes that this way of living would not long suffice animals, one of which only required almost a larger portion than a whole team of oxen. Thus far at least is certain, that if one should calculate the consumption of provisions made by a sea-cow from the size of its fauces, and from that of its body and of its belly, which hangs almost down to the ground, together with the quantity of

Hippopota-
mus.

Hippopota-
mus.

grafs which I have at different times observed to have been consumed by one of these animals in spots whither it has come over night to graze, the amount would appear almost incredible.

"We passed the following night at the same posts as we occupied on the night preceding, the sea-cows acting much in the same manner as before. On the 28th, after sun-rise, just as we were thinking of going from our posts home to our waggon, there comes a female hippopotamus with her calf, from some other pit or river, to take up her quarters in that which we were then blockading. While she was waiting at a rather steep part of the river's banks, and looking back after her calf, which was lame, and consequently came on but slowly, she received a shot in her side, upon which she directly plunged into the river: but was not mortally wounded; for Flip (the farmer's son), the drowsiest of all sublunary beings, who had shot her, and that instant could hardly be awakened by two Hottentots, was still half asleep when he fired his piece. And happy was it for him that the enormous beast did not make towards his hiding or rather sleeping place, and send him into the other world to sleep for ever. In the mean while his shot was so far of service, that one of my Hottentots ventured to seize the calf, and hold it fast by its hind-legs till the rest of the hunting party came to his assistance. Upon which the calf was fast bound, and with the greatest joy borne in triumph to our waggon; though while they were taking it over a shallow near the river, the Hottentots were very much alarmed lest the wounded mother and the other sea-cows should be induced by the cries of the calf to come to its rescue; the creature, as long as it was bound, making a noise a good deal like a hog that is going to be killed, or has got fast between two posts. The sound, however, proceeding from the hippopotamus calf was more shrill and harsh. It showed likewise a considerable share of strength in the attempt it made to get loose, and was found to be quite unmanageable and unwieldy: the length of it being already three feet and a half, and the height two feet; though the Hottentots supposed it to be no more than a fortnight, or at most three weeks, old. When at last it was turned loose, it ceased crying; and when the Hottentots had passed their hands several times over its nose, in order to accustom it to their effluvia, began directly to take to them.

"While the calf was yet alive, I made a drawing of it, a copy of which may be seen in the Swedish Transactions for 1778. After this it was killed, dissected, and eaten up in less than three hours time. The reason of this quick dispatch was partly the warmth of the weather, and partly our being in absolute want of any other fresh provisions. We found the flesh and fat of this calf as flabby as one might have expected from its want of age, and consequently not near so good as that of the old sea-cows; of which I found the flesh tender, and the fat of a taste like marrow, or at least not so greasy and strong as other fat. It is for this reason likewise that the colonists look upon the flesh and fat of the sea cow as the wholesomest meat that can be eaten; the gelatinous part of the feet in particular, when properly dressed, being accounted a great delicacy. The dried tongues of these animals are also

considered even at the Cape as a rare and savory dish. On my return to Sweden, I had the honour to furnish his majesty's table with a dried sea-cow's tongue, two feet and eight inches long. With respect to form, the tongue of a full-grown hippopotamus is very blunt at the tip, and is in fact broadest at that part; if at the same time it is slanted off towards one side, and marked with lobes, as I was informed it is, this circumstance may, perhaps, proceed from the friction it suffers against the teeth, towards the side on which the animal chiefly chews; at least some traces of this oblique form were discoverable on the dried tongue I am speaking of.

"The hide of the adult hippopotamus bears a great resemblance to that of the rhinoceros, but is rather thicker. Whips likewise made of this hide are stronger, and after being used some time, are more pliable than those made of the hide of the rhinoceros usually are, though they are not so transparent as these latter are when new.

"The food of the hippopotamus consists entirely of herbs and grafs, a circumstance of which we are informed by Father Lobo; and which may partly be inferred from what I have already said on the subject, as well as from the figure of the stomach belonging to the foetus of a hippopotamus given in Messrs de Buffon and Daubenton's elegant work. I therefore do not look upon it as very probable, that these animals, agreeably to the assertions of M. de Buffon, p. 93. or of Dampier in his voyage, should hunt after fish by way of preying upon them; especially as in some of the rivers of the southern part of Africa, where the sea-cows are seen daily and in great abundance, there is not a fish to be seen; and in others only a few bastard springers, as they are called (*cyprinus gonorynchus*), which are scarcely as big as a common herring. It is said, that a small species of carp is still more rarely to be met with here. It is true, that the sea-cows sometimes frequent the mouths of the rivers here, which are full of sea-fish, and even sometimes the sea itself: we know, however, that these huge quadrupeds are notwithstanding this obliged to go from thence upon dry land in quest of food. Neither is it probable that they can drink the sea-water; as an instance was related to me of the contrary in a hippopotamus, which, having been disturbed in the rivers, had taken refuge in the sea, and yet was obliged to go ashore every night and drink fresh water from a well in the neighbourhood, till at last it was shot by some people that lay in wait for it there. That the hippopotamuses actually lived in salt-water, I have seen evident proofs at the mouths both of *Kromme* and *Captour* rivers, particularly in the latter, on my journey homewards; where many of these animals blowed themselves in broad-day-light, and thrust their heads up above the water; and one of them in particular, which had been wounded by an ill directed shot on the nose, neighed from anger and resentment. In *Krakekamma* I saw on the beach manifest traces of a hippopotamus which had come out of the sea, but had retired thither again directly. That very attentive navigator Captain Burtz informed me, that he had frequently seen on the eastern coast of Africa sea-horses (meaning probably the hippopotamus) raise their heads above the surface of the water, in order to blow themselves and neigh. I have

Hippopota-
mus.

Hippopotamus. have been induced to be rather circumstantial on this subject, as M. Adanson had taken into his head, in his *Voyage au Senegal*, to limit the abode of the hippopotamus to the fresh water rivers only in Africa; and M. de Buffon has taken upon him to support this opinion, and to render Kolbe's testimony to the contrary liable to suspicion.

"An old experienced huntsman told me, that he had once seen two hippopotamuses copulate, which they did in the same manner as common cattle. On this occasion the beasts stood in a shallow part of the river, where the water reached up to their knees.

"The method of catching the hippopotamus consists (besides shooting it) in making pits for it in those parts which the animal passes in his way to and from the river: but this method is peculiar to the Hottentots; and is only practised by them in the rainy season, as the ground in summer is too hard for that purpose. It is said that they have never succeeded in killing this huge aquatic animal with poisoned darts, though this way of killing game is practised with advantage by the Hottentots for the destruction both of the elephant and rhinoceros. The colonists likewise were not entirely unacquainted with the method mentioned by M. Hasselquist, as being common in Egypt, viz. to strew on the ground as many pease or beans as the animal can possibly eat, by which means it bursts its belly and dies. But as this method is very expensive, and they can generally have this animal for a single charge of powder and a tin ball, shot in a proper direction, they chiefly and almost solely have recourse to this cheaper expedient.

"The hippopotamus is not so quick in its pace on land as the generality of the larger quadrupeds, though perhaps it is not so slow and heavy as M. de Buffon describes it to be; for both the Hottentots and colonists look upon it as dangerous to meet a hippopotamus out of the water, especially as, according to report, they had had a recent instance of one of these animals, which, from certain circumstances, was supposed to be in rut, having for several hours pursued a Hottentot, who found it very difficult to make his escape. The people of this country did not entertain that opinion of the medicinal virtues of the hippopotamus, as they did of certain parts of the elephant and rhinoceros; excepting one colonist, who imagined he had found the *os petrosum* of this animal reduced to powder, and taken in the quantity that would lie on the point of a knife, excellent in convulsions, and particularly in the convulsions (*stuypen*) of children. That the flesh is reckoned very wholesome food, I have already mentioned.

"Having already exceeded the limits I had prescribed to myself, I do not intend to dwell here on the anatomy of the hippopotamus we caught, particularly as the internal conformation of the calves is somewhat different from that of the adult animal. I shall therefore only briefly mention the following particulars: the stomachs were four in number, and consequently one more than in the foetus examined by M. Daubenton, which was kept in spirits. Compare Buffon, Tom. xii. Tab. iv. fig. 2. The two first stomachs were each of them about seven inches long and three inches in diameter; the third was nine inches in length, and a little wider than

the two former; the fourth was seven inches long, and at the upper part five inches broad, but decreased by degrees on one side till it terminated in the *pylorus*, which had an aperture an inch in width, being about half as wide again as the *cardia*. I did not observe any such valves as M. Daubenton has delineated. The first stomach we found mostly empty, it containing only a few lumps of cheese or curd; it likewise differed from the rest by the superior fineness of its internal coat. The internal membrane of the second stomach was rather coarser, and had many small holes in it; it likewise contained several clods of caseous matter, together with a great quantity of sand and mud. The third stomach had very visible folds, both longitudinal and transversal, on the inside of it, and contained caseous lumps of a yellow colour and harder consistence than the others, together with several leaves quite whole and fresh, and at the same time some dirt. The interior membrane of the fourth stomach was very smooth, though it was not without folds; in the stomach itself there was a good deal of dirt, with a small quantity of curds, which were whiter than they were in any of the other stomachs. This fourth stomach in a great measure covered the rest, being situated on the right side of the animal, and was found to have the upper part of the meat adhering to its superior and interior edge. This latter viscus, which was one foot long and three inches broad, diverged from it downwards on the left side. The intestinal canal was 109 feet long; the liver measured 14 inches from right to left, and 7 or 8 from the hind part to the fore part. On its anterior edges it had a large notch, being in other respects undivided and entire; it was of an oblique form, being broadest towards the left side, where I discovered a gall-bladder five inches in length. In the uterus there was nothing particularly worthy of observation. I found two teats, and the heart surrounded with much fat; the length of this muscle was five inches, and the breadth about four inches and a half. The communication between the auricles, called the *foramen ovale*, was above an inch in diameter. Each lung was eleven inches long and undivided: but at the superior and exterior part of the right lung there were two globules or processes elevated half an inch above the surface; and on the side corresponding to it, in the left lung, and in the upper part of it, there was a little excrescence, terminating in a point: somewhat below this, yet more forwards, there was found likewise a process half an inch in height. Directly over the lower part of the communication formed between the right and left lung, there was a kind of crest or comb, measuring an inch from the top to the basis.

"One of my brother sportsmen said, he had once observed a peculiar kind of vermin on the body of one of these amphibious animals; but on the calf we had caught we found nothing but a species of leech, which kept only about the anus, and likewise a good way up in the strait gut, where, by a timely abstraction of the blood, they may be of use to these large amphibious animals; and particularly may act as preservatives against the piles, repaying themselves for their trouble in kind. Most of them were very small; but on the other hand there was a considerable number of them. The only large one I saw of this species, being some-

Hippopotamus.

Hippopotamus,
Hippuris.

what more than an inch in length, I described and made a drawing of: this is inserted by the name of the *Hirudo Capensis*, corpore supra nigricante, medio longitudinaliter sub-brunneo, subtus pallide fusco, in the elegant Treatise on Worms, which M. Adolphus Nodeer, first secretary of the patriotic society, is preparing for the press. Instead of the lighter coloured streak upon the back, there was discoverable in some of these leeches one and sometimes two longitudinal brownish lines, which grew fainter and fainter towards the extremities.

"The huge animal of which we have been speaking, has doubtless obtained its present name of hippopotamus, which signifies river-horse, merely in consequence of the neighing sound it makes; as otherwise in its form it bears not the least resemblance to a horse, but rather to a hog. Neither does it in the least resemble the ox; so it could be only the different stomachs of this animal which could occasion it to be called *sea-cow* at the Cape; and perhaps it is for the same reason that the Hottentots call it the *t'gao*, which nearly approaches to *t'kau*, the name by which the buffalo is known among these people.

"From the account given by Bellonius of a tame hippopotamus, which he describes as a beast of a very mild and gentle nature, as well as from the disposition of the calf we had just caught, it follows, that this animal might be easily brought over to Europe, where it has been formerly exhibited at two different times in the public spectacles at Rome. For this purpose, the capture might easiest be made at Konaps-river, where these animals, according to the accounts given me by the Caffres, reside in great abundance; and milch-cows might be kept ready at hand, in order to rear the calf in case it was a suckling. Indeed I am apt to suppose, that one a little older than this would not be very nice in its food; as that which we caught was induced by hunger, as soon as it was let loose near the waggon, to put up with something not extremely delicate, which had been just dropped from one of our oxen. This perhaps may appear very extraordinary in an animal with four stomachs; but there have been instances of this kind known in common cattle, which in Herjedal are partly fed with horse-dung. (Vid.

• Hulpfers's
Description
of Norway.

A. A. Hulpfers's Beskrifning om Norrland *, 3:je Saml. om Herjedalen, p. 27—87.) I have been likewise assured, that this method of feeding cattle has been practised with great advantage in Uplandia, when there has been a scarcity of fodder; and that afterwards these same cattle, even when they have not been in want of proper fodder, have taken to this food of their own accord, and eaten it without any thing else being mixed with it."

HIPPURIS, MARE'S-TAIL: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the 15th order, *Inundata*. There is no calyx, nor any petals; the stigma is simple; and there is one seed. There is only one species, a native of Britain, and which grows in ditches and stagnant waters. The flower of this plant is found at the base of each leaf, and is as simple as can be conceived; there being neither empalement nor blossom; and only one chive, one pointal, and one seed. It is a very weak astrin-

gent. Goats eat it; cows, sheep, horses, and swine, refuse it.

HIRÆA, in botany; a genus of the trigynia order, belonging to the decandria class of plants. The calyx is pentaphyllous; the petals roundish and unguiculated; there are three bilabiated seeds.

HIRAM, a king of Tyre, cotemporary with Solomon, whom he supplied with cedar, gold, silver, and other materials for building the temple. He died 1000 years B. C.

HIRAM of Tyre, an artist who assisted in the construction of Solomon's temple, and other public buildings at Jerusalem, flourished 1015 B. C.

HIRCANIA (anc. geog.) See **HYRCANIA**.

HIRCH-HORN, a town of Germany, in the circle of the lower Rhine, with a strong castle. It is seated on the side of a hill on the river Neckar, and belongs to the elector Palatine. E. Long. 9. 0. N. Lat. 49. 28.

HIRE (Philip de la), an eminent French mathematician and astronomer, born at Paris in 1640. His father, who was painter in ordinary to the king, designed him for the same profession: but he devoted himself to mathematical studies, and was nominated together with M. Picard to make the necessary observations for a new map of France by the directions of M. Colbert. In 1683, he was employed in continuing the famous meridian line begun by M. Picard; and was next engaged in constructing those grand aqueducts which were projected by Louis XIV. He died in 1718, after having written a great number of works, besides several occasional papers dispersed in journals, and in memoirs of the Academy of Sciences.

HIRING, in law. See *BORROWING and Hiring*.

HIRPINI (anc. geog.), a people of Italy, next to the Samnites, to the south-east, and descendants from them; situated to the north of the Picentini, and to the west of the Apuli, having on the north the Apennin and a part of Samnium. The name is from *Hirpus*, a term denoting a wolf in their language; either because under the conduct of this animal the colony was led and settled, according to Strabo; or because, like that prowling animal, they lived on plunder, according to Servius.

HIRSBERG, a town of Silésia, in the territory of Jauer, famous for its mineral baths. It is seated on the river Bosar, in E. Long. 17. 50. N. Lat. 50. 50.

HIRSCHFELD, a town of Germany, in the circle of the upper Rhine, and capital of a principality of the same name, depending on a famous abbey which was secularized in favour of the house of Cassel. It is seated on the river Fulda, in E. Long. 9. 52. N. Lat. 51. 46.

HIRTELLA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. There are five petals; the filaments are very long, persisting, and spiral; the berry is monospermous; the style lateral.

HIRUDO, the **LEECH**; a genus of insects belonging to the order of vermes intestina. The body moves either forward or backward. There are several species, principally distinguished by their colour. The most remarkable are the following.

1. The

Hiræa

Hirudo.

Hirudo.

Plate
CCXXXIV.

1. The medicinalis, or medicinal leech, the form of which is well known, grows to the length of two or three inches. The body is of a blackish brown colour, marked on the back with six yellow spots, and edged with a yellow line on each side; but both the spots and the lines grow faint, and almost disappear, at some seasons. The head is smaller than the tail, which fixes itself very firmly to any thing the creature pleases. It is viviparous, and produces but one young one at a time, which is in the month of July. It is an inhabitant of clear running waters, and is well known for its use in bleeding. 2. The sanguisuga, or horse-leech, is larger than the former: Its skin is smooth and glossy; the body is depressed; the back is dusky; and the belly is of a yellowish green, having a yellow lateral margin. It inhabits stagnant waters. 3. The geometra, or geometrical leech, grows to an inch and a half in length; and has a smooth and glossy skin of a dusky brown colour, but in some seasons greenish spotted with white. When in motion, its back is elevated into a kind of ridge; and it then appears as if measuring the space it passed over like a compass, whence its name. Its tail is remarkably broad; and it holds as firmly by it as by the head. It is common on stones in shallow running waters; and is often found on trout and other fish after the spawning season. 4. The muricata, or muricated leech, has a taper body, rounded at the greater extremity, and furnished with two small tentacula or horns strongly annulated and rugged upon the rings, the tail dilated. It inhabits the Atlantic Ocean, and is by the fishermen called the *sea leech*. It adheres to fish, and generally leaves a black mark on the spot.

Barbut's
Genera Ver-
mium, p. 21.

The organs of generation in leeches are formed like those of the sea and land snails. See *HELI*.—The leech's head is armed with a sharp instrument that makes three wounds at once. They are three sharp tubercles, strong enough to cut through the skin of a man, or even of an ox or horse. Their mouth is as it were the body of the pump, and their tongue or fleshy nipple the sucker; by the working of this piece of mechanism, the blood is made to rise up to the conduit which conveys it to the animal's stomach, which is a membranaceous skin divided into 24 small cells. The blood which is sucked out is there preserved for several months almost without coagulating, and proves a store of provision to the animal. The nutritious parts, pure and already digested by animals, have no call to be disengaged from heterogeneous substances; nor indeed is there an anus discoverable in the leech, mere transpiration seems to be all that it performs, the matter fixing on the surface of its body, and afterwards coming off in small threads. Of this an experiment may be tried by putting a leech into oil, where it keeps alive for several days; upon being taken out and put into water, there appears to loosen from its body a kind of slough shaped like the creature's body. The organ of respiration, though unascertained, seems to be situated in the mouth; for if, like an insect, it drew its breath through vent holes, it would not subsist in oil, as by it they would be stopped up.

It is only the first species that is used in medicine; being applied to tender parts upon the vessels in order to draw off the inspissated blood with which they are overcharged, or to phlebotomize young children. If

the leech does not fasten, a drop of milk is put on the spot it is wished to fix on, or a little blood is drawn by means of a slight puncture, after which it immediately settles. Prudence requires it should be held fast with a piece of rush, lest it should find its way into the anus when used for the hemorrhoids, or penetrate into the œsophagus if employed to draw the gums; otherwise it would make the greatest havoc either in the stomach or intestines. In such a case, the best remedy is to drink salt water; which is the method practised to make it loose its hold when it sucks longer than was intended. Oil of tartar, volatile alkali, pepper, and acids, make it also leave the part on which it was applied. If, on the contrary, it is intended it should draw a larger quantity of blood, the end of its tail is cut off. It then sucks continually to make up the loss it sustains. The discharge occasioned by the puncture of a leech is easily stopped with brandy or other styptics.

At Ceylon, travellers who walk bare legged are molested by the great numbers of leeches concealed under the grass.—All leeches vary in their colours at some seasons, but they are generally of a dusky greenish brown or yellow, and often variegated. They are said to be very restless before a change of weather, if confined in glasses.

HIRUNDO, in ornithology, a genus of birds of the order of passerines. There are 37 species, chiefly distinguished by their colour. The most remarkable are,

1. The rustica, common or chimney-swallow, is distinguished from all the other species by the superior forkiness of its tail, and by the red spot on the forehead and under the chin. The crown of the head, the whole upper part of the body, and the coverts of the wings, are black, glossed with a rich purplish blue, most resplendent in the male: the breast and belly white, and in the male tinged with red: the tail is black; the two middle feathers are plain, the others marked transversely near their ends with a white spot: the exterior feathers of the tail are much longer in the male than in the female. The food of this swallow is the same with the others of its kind, viz. insects. For the taking of these, in their swiftest flight, nature has admirably contrived their several parts: their mouths are very wide to take in flies, &c. in their quickest motion; their wings are long, and adapted for distant and continual flight; and their tails are forked, to enable them to turn the readier in pursuit of their prey. This species is the first comer of all the British hirundines; and appears in general on or about the 13th of April, though now and then a straggler is seen much earlier. This hirundo, though called the *chimney-swallow*, by no means builds altogether in chimneys, but often within barns and out-houses against the rafters; and so she did in Virgil's time:

Ante
Garrula quàm tignis nidos suspendat hirundo.

In Sweden she builds in barns, and is called *ladu swala*, the barn swallow. Besides, in the warmer parts of Europe, there are no chimneys to houses except they are English built: in these countries she constructs her nest in porches, and gate-ways, and galleries, and open halls. Here and there a bird may affect some odd peculiar place.

Hirundo.

Hirundo.

place: but in general with us this species breeds in chimneys; and loves to haunt those stacks where there is a constant fire, no doubt for the sake of warmth. Not that it can subsist in the immediate shaft where there is a fire; but prefers one adjoining to that of the kitchen, and disregards the perpetual smoke of that funnel. Five or six or more feet down the chimney does this little bird begin to form her nest about the middle of May, which consists, like that of the house-martin, of a crust or shell composed of dirt or mud, mixed with short pieces of straw to render it tough and permanent; with this difference, that whereas the shell of the martin is nearly hemispheric, that of the swallow is open at the top, and like half a deep dish: this nest is lined with fine grasses, and feathers which are often collected as they float in the air. Wonderful is the address (Mr White observes) which this adroit bird shows all day long in ascending and descending with security through so narrow a pass. When hovering over the mouth of the funnel, the vibrations of her wings acting on the confined air occasion a rumbling like thunder. It is not improbable that the dam submits to this inconvenient situation so low in the shaft, in order to secure her broods from rapacious birds, and particularly from owls, which frequently fall down chimneys, perhaps in attempting to get at these nestlings.

This bird lays from four to six white eggs, dotted with red specks; and brings out her first brood about the last week in June, or the first week in July. The progressive method by which the young are introduced into life is very amusing: First, they emerge from the shaft with difficulty enough, and often fall down into the rooms below: for a day or so they are fed on the chimney-top, and then are conducted to the dead leafless bough of some tree, where, sitting in a row, they are attended with great assiduity, and may then be called *perchers*. In a day or two more they become flyers, but are still unable to take their own food: therefore they play about near the place where the dams are hawking for flies; and, when a mouthful is collected, at a certain signal given, the dam and the nestling advance, rising towards each other, and meeting at an angle; the young one all the while uttering such a little quick note of gratitude and complacency, that a person must have paid very little regard to the wonders of Nature that has not often remarked this feat. The dam betakes herself immediately to the business of a second brood as soon as she is disengaged from her first; which she at once associates with the first broods of house-martins; and with them congregates, clustering on sunny roofs, towers, and trees. This hirundo brings out her second brood towards the middle and end of August. All the summer long is the swallow a most instructive pattern of unwearied industry and affection; for from morning to night, while there is a family to be supported, she spends the whole day in skimming close to the ground, and exerting the most sudden turns and quick evolutions. Avenues, and long walks under hedges, and pasture-fields, and mown meadows where cattle graze, are her delight,

N^o 154.

especially if there are trees interspersed; because in such spots insects most abound. When a fly is taken a smart snap from her bill is heard, resembling the noise at the shutting of a watch-case; but the motion of the mandibles are too quick for the eye.

The swallow, probably the male bird, is the excubitor to house-martins and other little birds, announcing the approach of birds of prey. For as soon as a hawk appears, with a shrill alarming note he calls all the swallows and martins about him; who pursue in a body, and buffet and strike their enemy till they have driven him from the village, darting down from above on his back, and rising in a perpendicular line in perfect security. This bird also will sound the alarm, and strike at cats when they climb on the roofs of houses or otherwise approach the nests. Each species of hirundo drinks as it flies along, sipping the surface of the water; but the swallow alone, in general, washes on the wing, by dropping into a pool for many times together: in very hot weather house-martins and bank-martins dip and wash a little.—The swallow is a delicate songster, and in soft sunny weather sings both perching and flying; on trees in a kind of concert, and on chimney tops: it is also a bold flyer, ranging to distant towns and commons even in windy weather, which the other species seem much to dislike; nay, even frequenting exposed sea-port towns, and making little excursions over the salt-water. Horsemen on wide downs are often closely attended by a little party of swallows for miles together, which plays before and behind them, sweeping around, and collecting all the sculking insects that are roused by the trampling of the horses feet: when the wind blows hard, without this expedient, they are often forced to settle to pick up their lurking prey.

This species feeds much on little coleoptera, as well as on gnats and flies; and often settles on dug ground, or paths, for gravels to grind and digest its food. Mr White informs us, that before they depart, for some weeks, to a bird, they forsake houses and chimneys, and roost in trees; and usually withdraw about the beginning of October; though some few stragglers may be seen at times till the first week in November. Mr Pennant says, that for a few days previous to their departure, they assemble in vast flocks on house-tops, churches, and trees, from whence they take their flight (A). They are supposed to take up their winter-quarters in Senegal and parts adjacent; and seem to possess in turn the whole of the old continent, being known from Norway to the Cape of Good Hope on the one hand, and from Kamtschatka to India and Japan on the other. They are also found in all parts of North America, migrating north and south, as with us. Kalm says, that in America they build in houses and under the outsides of the roofs; also on the mountains, in such parts of them as project beyond the bottom, as well as under the corners of perpendicular rocks.

2. The tahitica, or Otaheite swallow, is five inches in length; its body is of a brown-black colour with a shining

(A) See MIGRATION.—Concerning the annual disappearance of these birds, however, naturalists have entertained different opinions; a detail of which, as the subject is curious, and would form too long a digression in this place, is reserved for a separate article. See SWALLOW.

Hirundo. shining bluish gloss, the breast of a fulvous purple, the abdomen of a sooty brown; the bill, tail, and legs are black. It inhabits the mountainous parts of Otaheite. See Fig. 1.

3. The *esculenta*, or edible swallow, according to Buffon, is less than the wren, and only two inches and a quarter in length. The bill is black; the upper parts of the body are brown, the under whitish; the tail is forked, and each feather of it tipped with white: the legs are brown. See Fig. 2.

Mr Latham thinks, that the size as above described is by much too small, as Mr Marsden says that the bird "appears to be the common martin;"—"and (says Mr Latham) we are much inclined to think that it is at least of that size, from the eggs which accompany the nest now in the British museum, which are as big as those of the martin, and of the same colour. However, we cannot dispute the point." The most curious part of the natural history of this bird consists in the nest, which is composed of such materials as render it not only edible, but one of the greatest dainties of the Asiatic epicures.

These nests (of which a particular account is given under the article *BIRDS-Nests*) are found in vast numbers in certain caverns, in various isles in the Soolo Archipelago, situated between longitude 117 and 120, latitude 5 and 7; particularly in three small isles, or rather rocks; in the caverns of which the nests are found fixed to the sides in astonishing numbers. They are also found in amazing quantities on a small island called *Toc*, in the straits of Sunda; the caverns of which are lined with the nests: but nowhere in greater abundance than about Croee, near the south end of Sumatra, four miles up a river of that name. But they are not peculiar to the above places; for they are likewise common from Java to Cochinchina on the north, and from the point of Sumatra west, to New Guinea on the east; where the sea is said to be covered with a viscous substance like half-melted glue, which the bird is supposed either to take up from the surface with its bill during flight, or to pick it from the rocks when left there by the waves.—Of these nests, it is said the Dutch alone export from Batavia 1000 pickles (B) every year, which are brought from the isles of Cochinchina, and those lying to the east of them. It is much to be wondered, that, among other luxuries imported by us from the east, the use of these nests should not have found a way to our tables; as being yet so scarce in England as to be kept as rarities in the cabinets of collectors. The bird itself at Sumatra is known by the name of Layonglayong.

4. The *borbonica*, or wheat-swallow, is about the size of the swift: the plumage above is blackish brown; beneath grey, marked with longitudinal brown spots: the tail is even at the end: the bill and legs are black. This species inhabits the Isle of France; frequenting places sown with wheat, and glades of woods; affecting elevated situations, and frequently seen perched on trees and stones. It follows herds of cattle for the sake of the flies which surround them; and is frequently seen in the wake of ships in great numbers, in

VOL. VIII. Part II.

the road near the isle, no doubt for the same purpose. *Hirundo*. It is often observed of evenings about the clefts in the mountains, where it is said to pass the night; and where it makes its nest, which is composed of straw and feathers. It lays two eggs, of a grey colour dotted with brown.

5. The *francica*, or grey-rumped swallow, is in length four inches and a quarter; having the upper parts of the body blackish, the rump and under parts whitish or grey. This species also inhabits the Isle of France, but not in great numbers; and is found chiefly in the neighbourhood of fresh waters. It flies swift; and is seldom observed to perch. It is supposed to rest in the woods at night, being seen about the skirts of them towards evening. It is generally very lean, and not good food.

6. The *urbica*, or martin, is inferior in size to the chimney-swallow, and its tail much less forked. The head and upper-part of the body, except the rump, is black glossed with blue: the breast, belly, and rump, are white: the feet are covered with a short white down. This is the second of the swallow-kind that appears in our country; and of its manners and economy we have the following curious account in the Rev. Mr White's Natural History of Selborne. "They begin to appear about the 16th of April; and for some time they in general pay no attention to the business of nidification: they play and sport about, either to recruit from the fatigue of their journey, if they do migrate at all; or else that their blood may recover its true tone and texture after it has been so long benumbed by the severities of winter. About the middle of May, if the weather be fine, the martin begins to think in earnest of providing a mansion for its family. The crust or shell of this nest seems to be formed of such dirt or loam as comes most readily to hand, and is tempered and wrought together with little bits of broken straws to render it tough and tenacious. As this bird often builds against a perpendicular wall without any projecting ledge under, it requires its utmost efforts to get the first foundation firmly fixed, so that it may safely carry the superstructure. On this occasion the bird not only clings with its claws, but partly supports itself by strongly inclining its tail against the wall, making that a fulcrum; and thus steadied, it works and plasters the materials into the face of the brick or stone. But then, that this work may not, while it is soft and green, pull itself down by its own weight, the provident architect has prudence and forbearance enough not to advance her work too fast; but by building only in the morning, and by dedicating the rest of the day to food and amusement, gives it sufficient time to dry and harden. About half an inch seems to be a sufficient layer for a day. Thus careful workmen, when they build mud-walls (informed at first perhaps by this little bird) raise but a moderate layer at a time, and then desist; lest the work should become top-heavy, and so be ruined by its own weight. By this method in about 10 or 12 days is formed an hemispheric nest, with a small aperture towards the top, strong, compact, and warm; and perfectly fitted for all the purposes for which it was intended.

3 Z

ed.

(B) The pickle, or pekul, is about 125 pounds; or, as Dampier says, 300 pickles are equal to 396 pounds English weight.—See Voy. vol. ii. p. 132.

Hirundo.

ed. But then nothing is more common than for the house-sparrow, as soon as the shell is finished, to seize on it as its own, to eject the owner, and to line it after its own manner. After so much labour is bestowed in erecting a mansion, as nature seldom works in vain, martins will breed on for several years together in the same nest, where it happens to be well sheltered and secure from the injuries of the weather. The shell or crust of the nest is a sort of rustic-work, full of knobs and protuberances on the outside: nor is the inside of those that I have examined smoothed with any exactness at all; but is rendered soft and warm, and fit for incubation, by a lining of small straws, grasses, and feathers; and sometimes by a bed of moss interwoven with wool. In this nest they tread or engender, frequently during the time of building; and the hen lays from three to five white eggs. At first, when the young are hatched, and are in a naked and helpless condition, the parent birds, with tender assiduity, carry out what comes away from their young. Was it not for this affectionate cleanliness, the nestlings would soon be burnt up and destroyed in so deep and hollow a nest by their own caustic excrement. In the quadruped creation the same neat precaution is made use of, particularly among dogs and cats, where the dams lick away what proceeds from their young. But in birds there seems to be a particular provision, that the dung of nestlings is enveloped in a tough kind of jelly, and therefore is the easier conveyed off without soiling or daubing. Yet, as nature is cleanly in all her ways, the young perform this office for themselves in a little time, by thrusting their tails out at the aperture of their nest. As the young of small birds presently arrive at their *naixis*, or "full growth," they soon become impatient of confinement, and sit all day with their heads out at the orifice, where the dams, by clinging to the nest, supply them with food from morning to night. For a time the young are fed on the wing by their parents; but the feat is done by so quick and almost imperceptible a flight, that a person must have attended very exactly to their motions, before he would be able to perceive it. As soon as the young are able to shift for themselves, the dams immediately turn their thoughts to the business of a second brood: while the first flight, shaken off and rejected by their nurses, congregate in great flocks, and are the birds that are seen clustering and hovering on sunny mornings and evenings round towers and steeples, and on the roofs of churches and houses. These congregations usually begin to take place about the first week in August; and therefore we may conclude that by that time the first flight is pretty well over. The young of this species do not quit their abodes all together; but the more forward birds get abroad some days before the rest. These approaching the eaves of buildings, and playing about before them, make people think that several old ones attend one nest. They are often capricious in fixing on a nesting-place, beginning many edifices, and leaving them unfinished; but when once a nest is completed in a sheltered place, it serves for several seasons. Those which breed in a ready finished house, get the start in hatching of those that build new by 10 days or a fortnight. These industrious artificers are at their labours in the long days before four in the morning: when they fix their materials, they plaster them on with their chins, moving their heads with a quick vi-

bratory motion.—They dip and wash as they fly sometimes in very hot weather, but not so frequently as swallows. Martins love to frequent towns, especially if there are great lakes and rivers at hand. They are by far the least agile of the British hirundines: their wings and tails are short, and therefore they are not capable of such surprising turns, and quick and glancing evolutions as the swallow. Accordingly, they make use of a placid easy motion, in a middle region of the air, seldom mounting to any great height, and never sweeping long together over the surface of the ground or water. They do not wander far for food; but affect sheltered districts, over some lake, or under some hanging wood, or in some hollow vale, especially in windy weather. They breed the latest of all the swallow kind: in 1772 they had nestlings on to October the 21st, and are never without unfledged young as late as Michaelmas.—As the summer declines, the congregating flocks increase in numbers daily, by the constant accession of the second broods; till at last they swarm in myriads upon myriads round the villages on the Thames, darkening the face of the sky as they frequent the aits of that river, where they roost. They retire, the bulk of them I mean, in vast flocks together about the beginning of October: but have appeared of late years in a considerable flight in this neighbourhood, for one day or two as late as November the 3d and 6th, after they were supposed to have been gone for more than a fortnight. They therefore withdraw with us the latest of any species. Unless these birds are very short-lived indeed, or unless they do not return to the district where they are bred, they must undergo vast devastations some how, and some where; for the birds that return yearly bear no manner of proportion to the birds that retire."

7. The rufa, or rufous-bellied swallow, is of the same size with the former; and has the upper parts of the body of a glossy black; the under rufous, growing paler towards the vent: the forehead is whitish; and the bill and legs are dusky. These are found at Cayenne, and not unfrequently as far north as New-York. They build in houses, without any mixture of mud; fabricating the nest with moss, dried plants, and short bits of sticks, all united with a sort of gum, so as scarce to be broken, and lined with feathers; suspending it from the beams and rafters, sides of walls, and eaves of houses. It is sometimes a foot and a half in length; and is fixed by one of its sides, the opening being made near the bottom. The female lays four or five eggs; and the young go out as soon as their wings will support them.

8. The riparia, sand-martin, or shore-bird, is 4½th inches in length, with the whole upper parts of the body of a mouse-colour, the throat and under parts white, the bill and legs blackish. It is common about the banks of rivers and sand pits, where it terebrates a round and regular hole in the sand or earth, which is serpentine, horizontal, and about two feet deep. At the inner end of this burrow does the bird deposit, in a good degree of safety, her rude nest, consisting of fine grasses and feathers, usually goose-feathers, very inartificially laid together. "Though at first (says Mr White) one would be disinclined to believe that this weak bird, with her soft and tender bill and claws, should ever be able to bore the stubborn

Hirundo.

born

Hirundo. born sand-bank without entirely disabling herself; yet with these feeble instruments have I seen a pair of them make great dispatch; and could remark how much they had scooped that day by the fresh sand which ran down the bank, and was of a different colour from that which lay loose and bleached in the sun. In what space of time these little artists are able to mine and finish these cavities I have never been able to discover: but it would be a matter worthy of observation, where it falls in the way of any naturalist to make his remarks. This I have often taken notice of, that several holes of different depths are left unfinished at the end of summer. To imagine that these beginnings were intentionally made in order to be in the greater forwardness for next spring, is allowing perhaps too much foresight and *rerum prudentia* to a simple bird. May not the cause of these *latebræ* being left unfinished arise from their meeting in those places with strata too harsh, hard, and solid, for their purpose, which they relinquish, and go to a fresh spot that works more freely? Or may they not in other places fall in with a soil as much too loose and mouldering, liable to flounder, and threatening to overwhelm them and their labours? One thing is remarkable—that, after some years, the old holes are forsaken and new ones bored; perhaps because the old habitations grow foul and fetid from long use, or because they may so abound with fleas as to become untenable. This species of swallow moreover is strangely annoyed with fleas: and we have seen fleas, bed-fleas (*pulex irritans*), swarming at the mouths of these holes, like bees on the stools of their hives.

The sand-martin arrives much about the same time with the swallow; and lays, as she does, from four to six white eggs. But as this species is *cryptogame*, carrying on the business of nidification, incubation, and the support of its young in the dark, it would not be easy to ascertain the time of breeding, were it not for the coming forth of the broods, which appear much about the time, or rather somewhat earlier than those of the swallow. The nestlings are supported in common, like those of their congeners, with gnats and other small insects; and sometimes they are fed with *libellula* (dragon flies) almost as long as themselves. This *hirundo* is said to lay only once in a year, and to produce its young more early than the rest of its tribe: though from this last circumstance it would seem probable that they breed at least a second time like the house-martin and swallow. It does not always take pains to make an hole for a nest; frequently laying in cavities of quarries, and in hollows of trees, where it is convenient. When they happen to breed near hedges and enclosures, they are often dispossessed of their breeding holes by the house-sparrow, which is on the same account a fell adversary to house-martins. These *hirundines* are no songsters, but rather mute, making only a little harsh noise when a person approaches their nests. They seem not to be of a sociable turn, never with us congregating with their congeners in the autumn. They have a peculiar manner of flying; sitting about with odd jerks and vacillations, not unlike the motions of a butterfly. Doubtless the flight of all *hirundines* is influenced by and adapted to the peculiar sort of insects which furnish their food. Hence (says Mr White) it would be worth inquiry to examine what particular

genus of insects affords the principal food of each *Hirundo* respective species of swallow.

9. The montana, or crag-swallow, is about the size of the martin, and in its upper plumage like the sand-martin: the under part of the body is rufous; the tail is scarcely forked; the legs are covered with grey down mixed with brown; the bill and the claws are black. These birds inhabit the rocks and crags about Savoy; arriving there the middle of April, and departing the 15th of August, for the most part; now and then some stragglers remain to the 10th of October. This species is also found in the mountains of Auvergne and Dauphine; and specimens have been received from Gibraltar.

10. The *purpurea*, or purple swallow, is in length seven inches, and the whole body is of a deep violet, very glossy: the quills and tail are of the same colour, but still deeper, and the last forked: the legs and claws are blackish; and the bill is black. The colour of the female is dusky brown, with a slight tinge of violet. This species is found in summer in Carolina and Virginia; coming in May, and retiring at the approach of winter. The common people are very fond of them; and make little conveniences of boards on the outsides of their houses for the birds to build in, like as is done for sparrows in England; being desirous to keep them near, as they are of much use in alarming the poultry of the approach of the hawk and other birds of prey; not only shrieking violently on the appearance of these enemies, but attacking them with all the efforts of our martins in Europe. See fig. 4.

11. The *apus*, or swift, is a large species, being near eight inches long, with an extent of wing near eighteen inches, though the weight of the bird is only one ounce. Their feet are so small, that the action of walking and rising from the ground is extremely difficult; so that nature has made it full amends, by furnishing it with ample means for an easy and continual flight. It is more on the wing than any other swallow; its flight is more rapid, and that attended with a shrill scream. It rests by clinging against some wall, or other apt body; from whence Klein styles this species *hirundo muraria*. It breeds under the eaves of houses, in steeples, and other lofty buildings; and makes its nest of grasses and feathers. The feet of this species are of a particular structure, all the toes standing forward: the least consists of only one bone; the others of an equal number, viz. two each; in which they differ from those of all other birds: a construction, however, nicely adapted to the purposes in which their feet are employed.

The swift is a summer inhabitant of these kingdoms. It comes the latest, and departs the soonest, of any of the tribe; not always staying to the middle of August, and often not arriving before the beginning of May. A pair of these birds were found adhering by their claws, and in a torpid state, in Feb. 1766, under the roof of Longnor chapel, Shropshire; on being brought to a fire, they revived, and moved about the room.

The fabulous history of the *manucodiata*, or bird of paradise (says Mr Pennant), is, in the history of this species, in great measure verified. It was believed to have no feet; to live upon the celestial dew; to float perpetually on the atmosphere; and to perform all its functions in that element. The swift actually

Hirundo.

performs what has been in these enlightened times disapproved of the former, except the small time it takes in sleeping, and what it devotes to incubation; every other action is done on wing. The materials of its nest it collects either as they are carried about by the winds, or picks them up from the surface in its sweeping flight. Its food is undeniably the insects that fill the air. Its drink is taken in transient sips from the water's surface. Even its amorous rites are performed on high. Few persons who have attended to them in a fine summer's morning, but must have seen them make their aerial courses at a great height, encircling a certain space with an easy steady motion. On a sudden they fall into each others embraces, then drop precipitate with a loud shriek for numbers of yards. This is the critical conjuncture; and to be no more wondered at, than that insects (a familiar instance) should discharge the same duty in the same element.

The swift is a most alert bird, rising very early, and retiring to roost very late; and is on the wing in the height of summer at least sixteen hours. In the longest days it does not withdraw to rest till a quarter before nine in the evening, being the latest of all day birds. Just before they retire, whole groups of them assemble high in the air, and squeak, and shoot about with wonderful rapidity. But this bird is never so much alive as in sultry thundery weather, when it expresses great alacrity, and calls forth all its powers. In hot mornings several, getting together in little parties, dash round the steeples and churches, squeaking as they go in a very clamorous manner: these, by nice observers, are supposed to be males serenading their fitting hens; and not without reason, since they seldom squeak till they come close to the walls or eaves, and since those within utter at the same time a little inward note of complacency. When the hen has sat hard all day, she rushes forth just as it is almost dark, and stretches and relieves her weary limbs, and snatches a scanty meal for a few minutes, and then returns to her duty of incubation. Swifts, when wantonly and cruelly shot while they have young, discover a little lump of insects in their mouths, which they pouch and hold under their tongue. In general, as already observed, they feed in a much higher district than the other species; they also range to vast distances; since locomotion is no labour to them, who are endowed with such wonderful powers of wing. At some certain times in the summer, however, they have been observed hawking very low for hours together over pools and streams; and upon inquiring into the object of their pursuit that induced them to descend so much below their usual range, it has been found that they were taking *phryganea*, *ephemera*, and *libellula* (cadew-flies, may-flies, and dragon-flies), that were just emerged out of their aurelia state. It appeared then no longer a wonder that they should be so willing to stoop for a prey that afforded them such plentiful and succulent nourishment. —Swifts sometimes pursue and strike at hawks that come in their way; but not with that vehemence and fury that swallows express on the same occasion. They are out all day long in wet days, feeding about and disregarding still rain: from whence two things may be gathered; first, that many insects abide high in the air, even in rain; and next, that the feathers of these birds must be well preened to resist so much wet.

Hirundo.

Windy weather, and particularly with heavy showers, they dislike; and on such days withdraw, and are scarce ever seen. —There is a circumstance respecting the colour of swifts (Mr White remarks), which seems not to be unworthy our attention. When they arrive in the spring, they are all over of a glossy dark foot-colour, except their chins, which are white; but, by being all day long in the sun and air, they become quite weather-beaten and bleached before they depart, and yet they return glossy again in the spring. Now, if they pursue the sun into lower latitudes, as some suppose, in order to enjoy a perpetual summer, why do they not return bleached? Do they not rather perhaps retire to rest for a season, and at that juncture moult and change their feathers, since all other birds are known to moult soon after the season of breeding?

“Swifts (continues our author) are very anomalous in many particulars, dissenting from all their congeners not only in the number of their young, but in breeding once in a summer; whereas all the other British hirundines breed invariably twice. It is past all doubt that swifts can breed but once, since they withdraw in a short time after the flight of their young, and some time before their congeners bring out their second broods. We may here remark, that, as swifts breed but once in a summer, and only two at a time, and the other hirundines twice, the latter, who lay from four to six eggs, increase at an average five times as fast as the former. But in nothing are swifts more singular than in their early retreat. They retire, as to the main body of them, by the tenth of August, and sometimes a few days sooner: and every straggler invariably withdraws by the twentieth, while their congeners, all of them, stay till the beginning of October; many through all that month, and some occasionally to the beginning of November. This early retreat is mysterious and wonderful, since that time is often the sweetest season in the year. But, what is more extraordinary, they begin to retire still earlier in the most southerly parts of Andalusia, where they can be no ways influenced by any defect of heat; or, as one might suppose, defect of food. Are they regulated in their motions with us by a failure of food, or by a propensity to moulting, or by a disposition to rest after so rapid a life, or by what? This is one of those incidents in natural history that not only baffles our searches, but almost eludes our guesses!”

Swifts never perch on trees or roofs, and so never congregate with their congeners. They are fearless while haunting their nesting places; and are not to be scared with a gun; and are often beaten down with poles and cudgels as they stoop to go under the eaves. Mr White informs us, that having untiled part of a roof over the nest of a swift, the dam notwithstanding sat in the nest: so strongly was she affected by natural *σφοδρην* for her brood, which she supposed to be in danger, that, regardless of her own safety, she would not stir, but lay sullenly by them, permitting herself to be taken in hand. Swifts are much infested with those pests to the genus called *bippobosca hirundinis*; and often wriggle and scratch themselves, in their flight, to get rid of that clinging annoyance. And young ones, over-run with these insects, are sometimes found under their nests, fallen to the ground; the number of vermin rendering their abode insupportable.

Swifts

Hirundo.

Swifts are no songsters, and have only one harsh screaming note; yet there are ears to which it is not displeasing, from an agreeable association of ideas, since that note never occurs but in the most lovely summer weather. They never settle on the ground but through accident; neither can they walk, but only crawl; but they have a strong grasp with their feet, by which they cling to walls, as already noticed. Their bodies being flat, they can enter a very narrow crevice; and where they cannot pass on their bellies, they will turn up edgewise.—In London a party of swifts frequents the tower, playing and feeding over the river just below the bridge: others haunt some of the churches of the borough next the fields; but do not venture, like the house-martin, into the close crowded part of the town. The Swedes have bestowed a very pertinent name on this swallow, calling it *ring swala*, from the perpetual rings or circles that it takes round the scene of its nidification.—As these birds are apt to catch at every thing on the wing, many have taken them by a bait of a cockchafer tied to a thread, which they have swallowed as freely as a fish theirs. In the Isle of Zant, the boys are said to get on an elevated place, and merely with a hook baited with a feather, have caught five or six dozen of them in a day. Besides our island, the swift is known to inhabit the whole of the European continent; and has also been noticed at the Cape of Good Hope, and Carolina in North America. Hence, most likely, a general inhabitant of both the old and new continents.

12. The ambrosiaca, or ambergris swallow, is about the size of a wren, with grey plumage and a very forked tail; the bill is blackish, and the legs are brown. It inhabits Senegal, and is said to smell very strong of ambergris.

13. The pelasgia, or aculeated swallow, is somewhat less than our chimney-swallow: its plumage is brown, but at the throat whitish, and all the tail-feathers are terminated by a bare pointed shaft. It inhabits Carolina and Virginia in the summer time, and builds in chimneys. See fig. 3.

14. The melba, or white-bellied swift, is in length $8\frac{1}{2}$ inches, and weighs two ounces five drams: the bill is half an inch, somewhat bent, and black: the upper parts of the body are of a grey brown; the wings and tail deepest, with a gloss of red and green in some lights: the throat, breast, and belly, are white; on the neck is a collar of grey brown, mixed with blackish: the sides are dusky, and white mixed; lower part of the belly, and under tail-coverts, the same as the back: the legs are flesh-coloured, and covered with feathers on the fore part and inside: all the toes are placed forward, as in our swift. This bird inhabits the mountainous parts of Spain; building in the holes of rocks. It is found also on the borders of the Rhone, in Savoy, the isle of Malta, Alps of Switzerland, and rock of Gibraltar. It comes into Savoy the beginning of April, and frequents the ponds and marshes for 15 or 20 days; after which it retires to the mountainous parts to breed. It flies higher than our swift; but feeds on the same food, and its flesh is accounted a delicate morsel. This species is not numerous. Scopoli says it builds on the summit of the mountains of Tyrol.

15. The cayennensis, or white-coloured swallow, is

about the size of the martin: the head and bill are black; the chin and throat white, passing from the last in a narrow collar round the neck: between the bill and eye is a streak of white, which forks off into two; one passing a little above and the other a little way beneath the eye: the rest of the plumage is black, with a gloss of violet; but the greater coverts, nearest the body, are brown, edged with white: the quills and tail are black; the last forked: the legs are black; and all the four toes placed before as in our swift, and covered with feathers to the claws.—This bird makes its nest in the houses at Cayenne. It is of a large size, in shape of a truncated cone; five inches one way by three the other, and nine inches in length. It is composed of the down of dogs-bane, well wove together; the cavity divided obliquely about the middle, lengthways, by a partition, which spreads itself over that part of the nest where the eggs lie, which is pretty near the base: a small parcel of the same soft down, forming a kind of plug, is placed over the top, serving to keep the young brood from the impression of the air; from which we may suppose them to be very tender.

16. The erythrocephala, or red-headed swallow, has a red head, with a short flat dusky bill: the back is dusky, the feathers edged with white: the under parts of the body are white, the tail coverts pale brown: the wings are both dusky; as is also the tail, which is a little forked. It inhabits India; and is only the size of a small humming-bird.

17. The nigra, or black swallow, measures near six inches in length: the colour of the bird is wholly black, and the tail is forked. It inhabits St Domingo and Cayenne; but is not numerous. It is often seen to perch on dead trees; and only inhabits dry savannas inland. It scoops out a hole in the earth, half a foot in length, the mouth of it very small, so as just to permit entrance: in this cavity it constructs the nest and rears the young.

18. The dominicensis, or St Domingo swallow, is 7 inches in length, and wholly black, with the gloss of polished steel, except the belly and under tail coverts, which are white: the tail is very little forked: the legs, bill, and claws are brown. It inhabits St Domingo, and other of the West India islands, in May, June, and July; and is said to imitate a lark in its song.

To this article we may not improperly subjoin the following paper (from the Gentleman's Magazine) on the utility of encouraging the breed of swallows, swifts, and martins. "The advantages that accrue to man, from the docility with which the domesticated animals accommodate themselves to his uses, are obvious. But there are others, who attend on him of their own accord, whose beneficial exertions are little known or observed. Among these I shall at present only notice the family of swallows (*hirundines*); of the four kinds of which bird found in our island three attach themselves to his dwelling, as if peculiarly solicitous for his welfare. This connection seems so reciprocal, that where men do not inhabit, few swallows can find proper conveniences for their summer-residences; and as their food consists wholly of insects, the most diligent inquirer hath not been able to discover that they injure in the slightest degree the productions of the field or garden; a circumstance nearly singular.

Hirundo.

Hirundo, singular to these birds. The charge which Virgil, copying the Grecian writers, brings against them, of killing bees, is in this country groundless, and I apprehend it to be so in every other :

“ Absint ———
 ——— Meropesque aliaque volucres,
 Et manibus Procne pectus signata cruentis;
 Omnia nam late vastant, ipsasque volantes
 Ore ferunt, dulcem nidis immitibus escam.”

Georg. l. 4. v. 23.

For the mouths of the swallow tribe are by no means adapted to catch stinging insects with impunity. The birds who prey on bees have a long extended bill constructed for that purpose, very different from that of the swallow.

“ By the myriads of insects which every single brood of swallows destroys in the course of a summer, they defend us in a great measure from the personal and domestic annoyance of flies and gnats; and, what is of infinitely more consequence, they keep down the numbers of our minute enemies, who, either in the grub or winged state, would otherwise render the labours of the husbandman fruitless. Since then swallows are guardians of our corn, they should every where be protected by the same popular veneration which in Egypt defends the Ibis and the stork in Holland. We more frequently hear of unproductive harvests on the Continent than in this country; and it is well known that swallows are caught and sold as food in the markets of Spain, France, and Italy. When this practice has been very general and successful, I have little doubt that it hath at times contributed to the scarcity of corn. In England we are not driven to such resources to furnish our tables. But what apology can be made for those, and many there are, whose education and rank should have taught them more innocent amusements, who wantonly murder swallows, under the idle pretence of improving their skill in shooting game? Setting aside the cruelty of starving whole nests of young by killing the dam; they who follow this barbarous diversion would do well to reflect, that by every swallow they kill, they assist blights, mildews, and vermin, in causing a scarcity of bread. Every lord of a manor should restrain his game-keeper from this execrable practice; nor should he permit any person to sport on his lands who does not refrain from it. For my part, I am not ashamed to own that I have tempted martins to build around my house, by fixing escallop shells, in places convenient for their pendant beds and procreant cradles; and have been pleased to observe with what caution the little architect raised a buttress under each shell before he ventured to form his nest on it.

“ What has induced me to send you these strictures at this time, are the accounts of the ravages committed on the cultivation of corn in the United States of North America, by an insect called the *Hessian-Fly*. (See the article *HESSIAN-Fly*.) How far there is danger of this desolating scourge being imported into this country by the admission of American wheat, I must leave to abler entomologists to decide. But that this destructive insect should, as hath lately been asserted, totally disappear in one season, after having for a number of years successively laid waste wide extended districts, is a phenomenon hardly to be assented to by

those who have turned their minds to inquiries of this sort.

“ Might I not here enlarge on the importance of researches into the works of the creation, when we see statesmen, as in the present instance, making solemn applications to those who are studious of nature, requesting their direction how to avoid the calamity apprehended from a fly? And may we not then add, that the minutest observations of this kind are only deemed trivial by the indolent and uninformed?

“ I recollect but a single complaint against the swallow, and that is made by Anacreon, Od. 12. who bitterly reproaches this bird for disturbing him by its twittering while he was dozing away the intoxication of the preceding night. Yet, had the poet been temperate, like Milton, he would with pleasure have arisen from his bed at the charm of earliest birds.

“ With what joy the Grecians welcomed the return of the swallow, appears by the very ancient carol preserved by Athenæus; of which the following is a translation:—

The swallow! the swallow! she does with her bring
 Soft seasons and all the delights of the spring:
 The swallow! the swallow! we're sure we are right,
 For her back is all black, and her belly all white.
 From your stores, ye good housewives, produce, if you please,
 Lumps of figs, jugs of wine, and some wheat and some cheese.
 With some hen eggs the swallow will well be content.
 Must we go then, or shall we have any thing sent?
 We will not allow you to do as you choose,
 To give or give not, to comply or refuse;
 But will certainly take from its hinges the door,
 Or bear off the good dame as she sits on the floor;
 She is little and light, we can manage her sure. }
 Open, open the door to the swallow—for we
 Are playful young children, not men—you may see.

HISPA, in zoology; a genus of insects belonging to the coleoptera order, the characters of which are these: The antennæ are fusiform, growing gradually larger from each extremity towards the middle; and are situated between the eyes: the thorax and elytra are covered with protuberances or spines. The larva of this insect seems to be yet wholly unknown. There are but two species of the perfect animal met with in Europe; one of which, the *atra*, is found in Britain, and is all over of a deep unpolished black, and has the upper part of its body entirely covered with long and strong spines, which render it bristly like the shell of a chestnut. There is even a spine at the base of the antennæ; the thorax has a row set transversely, which are forked; and the elytra are furnished with a very great number that are single. Its being thus covered with spines, makes it resemble a hedge-hog in miniature. It is rather hard to catch, letting itself fall down on the ground as soon as approached. It bears its antennæ upright before it.

HISPALIS a town of Bætica, in the Farther Spain; an ancient mart or trading town on the Bætis, navigable quite up to it for ships of burthen, and thence to Corduba for river barges. Called *Colonia Romulensis*. It has also a conventus juridicus, a court of justice, or assizes, (Pliny). Now called *Seville*. W. Long. 6°. N. Lat. 37°.

HISPANIA, called *Hesperia Ultima*, (Horace), because the westmost part of Europe; also *Iberia*, from the river Iberus. Its name *Hispania*, or *Spania*, (Greek),

Hirundo.

||

Hispania.

||

Plate
CCXXXV.

Hispaniola. (Greek), is of Phœnician original, from its great number of rabbits: the Phœnicians, who settled several colonies on the coast calling it *Spanjah* from these animals. It has the sea on every side, except on that next to Gaul, from which it is separated by the Pyrenees. The Romans at first divided it into the Farther and Hither Spain, under two prætors. In that state it continued down to Augustus; who divided the Farther Spain into Bætica, which he left to the people to be governed by a pro consul; and into Lusitania, which he added to his own provinces; calling the Hither Spain *Tarraconensis*. Hispania was a country celebrated for its fertility, of which it has greatly fallen short in modern times. The people were of a warlike turn, (Strabo); and their bodies being formed for hardships and labour, they ever preferred war to peace, and were remarkably prodigal of life (Justin, Sil. Italicus). Spain produced several great men, both in a literary and a political capacity. See SPAIN.

HISPANIOLA, called also **St DOMINGO**, the largest of the Antilles or Caribbee islands, extending about 420 miles from east to west, and 120 in breadth from north to south; lying between $17^{\circ} 37'$ and 20° of N. Lat. and between $67^{\circ} 35'$ and $74^{\circ} 15'$ W. Long. The climate is hot, but not reckoned unwholesome; and some of the inhabitants are said to arrive at the age of 120. It is sometimes refreshed by breezes and rains; and its salubrity is likewise in a great measure owing to the beautiful variety of hills and valleys, woods and rivers, which every where present themselves. It is indeed reckoned by far the finest and most pleasant island of the Antilles, as being the best accommodated to all the purposes of life when duly cultivated.

This island, famous for being the earliest settlement of the Spaniards in the new world, was at first in high estimation for the quantity of gold it supplied: this wealth diminished with the inhabitants of the country, whom they obliged to dig it out of the bowels of the earth; and the source of it was entirely dried up, when they were exterminated, which was quickly done, by a series of the most shocking barbarities that ever disgraced the history of any nation. Benzoni relates, that of two millions of inhabitants, contained in the island when discovered by Columbus in 1492, scarce 153 were alive in 1545. A vehement desire of opening again this source of wealth inspired the thought of getting slaves from Africa; but, besides that these were found unfit for the labours they were destined to, the multitude of mines, which then began to be wrought on the continent, made those of Hispaniola no longer of any importance. An idea now suggested itself, that their negroes, which were healthy, strong, and patient, might be usefully employed in husbandry; and they adopted, through necessity, a wise resolution, which, had they known their own interest, they would have embraced by choice.

The produce of their industry was at first extremely small, because the labourers were few. Charles V. who, like most sovereigns, preferred his favourites to every thing, had granted an exclusive right of the slave-trade to a Flemish nobleman, who made over his privilege to the Genoese. Those avaricious republicans conducted this infamous commerce as all mono-

polies are conducted; they resolved to sell dear, and they sold but few. When time and competition had fixed the natural and necessary price of slaves, the number of them increased. It may easily be imagined, that the Spaniards, who had been accustomed to treat the Indians as beasts, did not entertain a higher opinion of these negro Africans, whom they substituted in their place. Degraded still farther in their eyes by the price they had paid for them, even religion could not restrain them from aggravating the weight of their servitude. It became intolerable, and these wretched slaves made an effort to recover the unalienable rights of mankind. Their attempt proved unsuccessful; but they reaped this benefit from their despair, that they were afterwards treated with less inhumanity.

This moderation (if tyranny cramped by the apprehension of revolt can deserve that name) was attended with good consequences. Cultivation was pursued with some degree of success. Soon after the middle of the 16th century, the mother country drew annually from this colony ten millions weight of sugar, a large quantity of wood for dying, tobacco, cocoa, cassia, ginger, cotton, and peltry in abundance. One might imagine, that such favourable beginnings would give both the desire and the means of carrying them further; but a train of events, more fatal each than the other, ruined these hopes.

The first misfortune arose from the depopulation of the island. The Spanish conquests on the continent should naturally have contributed to promote the success of an island, which nature seemed to have formed to be the centre of that vast dominion arising around it, to be the staple of the different colonies. But it fell out quite otherwise: on a view of the immense fortunes raising in Mexico, and other parts, the richest inhabitants of Hispaniola began to despise their settlements, and quitted the true source of riches, which is on the surface of the earth, to go and ransack the bowels of it for veins of gold, which are quickly exhausted. The government endeavoured in vain to put a stop to this emigration; the laws were always either artfully eluded, or openly violated.

The weakness, which was a necessary consequence of such a conduct, leaving the coasts without defence, encouraged the enemies of Spain to ravage them. Even the capital of this island was taken and pillaged by that celebrated English sailor, Sir Francis Drake. The cruizers of less consequence contented themselves with intercepting vessels in their passage through those latitudes, the best known at that time of any in the new world. To complete these misfortunes, the Castilians themselves commenced pirates. They attacked no ships but those of their own nation; which were more rich, worse provided, and worse defended, than any others. The custom they had of fitting out ships clandestinely, in order to procure slaves, prevented them from being known; and the assistance they purchased from the ships of war, commissioned to protect the trade, insured to them impunity.

The foreign trade of the colony was its only resource in this distress; and that was illicit: but as it continued to be carried on, notwithstanding the vigilance of the governors, or, perhaps, by their connivance,

the

Hispaniola. the policy of an exasperated and short-sighted court exerted itself in demolishing most of the sea-ports, and driving the miserable inhabitants into the inland country. This act of violence threw them into a state of dejection; which the incursions and settlement of the French on the island afterwards carried to the utmost pitch. The latter, after having made some unsuccessful attempts to settle on the island, had part of it yielded to them in 1697, and now enjoy by far the best share.

Spain, totally taken up with that vast empire which she had formed on the continent, used no pains to dissipate this lethargy. She even refused to listen to the solicitations of her Flemish subjects, who earnestly pressed that they might have permission to clear those fertile lands. Rather than run the risk of seeing them carry on a contraband trade on the coasts, she chose to bury in oblivion a settlement which had been of consequence, and was likely to become so again.

This colony, which had no longer any intercourse with the mother country but by a single ship, of no great burthen, that arrived from thence every third year, consisted, in 1717, of 18,410 inhabitants, including Spaniards, Mestees, Negroes, or Mulattoes. The complexion and character of these people differed according to the different proportions of American, European, and African blood they had received from that natural and transient union which restores all races and conditions to the same level. These demi-savages, plunged in the extreme of sloth, lived upon fruits and roots, dwelt in cottages without furniture, and most of them without clothes. The few among them, in whom indolence had not totally suppressed the sense of decency and taste for the conveniences of life, purchased clothes of their neighbours the French in return for their cattle, and the money sent to them for the maintenance of two hundred soldiers, the priests, and the government. It doth not appear that the company, formed

at Barcelona in 1757, with exclusive privileges for the re-establishment of St Domingo, hath as yet made any considerable progress. They send out only two small vessels annually, which are freighted back with six thousand hides, and some other commodities of little value. See *St Domingo*.

HISTER, in zoology; a genus of the coleoptera order of insects. The first articulation of the antennæ is compressed and curved; the last is considerably larger than the others, and appears to be a solid knob: the head is drawn within the body; the mouth is forcipated; the elytra are shorter than the body; and the fore-legs are dentated. The body of these creatures is polished and very shining, and their form almost square; the thorax large, and highly polished: anteriorly it is made with a slope, in the cavity of which is lodged the head, the position of which is often only discovered by the projection of the maxillæ; for the head, for the most part, is so withdrawn under the thorax, that the insect looks as if it had none. The elytra are as if it were cut off towards the extremity, and do not cover the whole of the abdomen. They are extremely smooth, and only have a few striæ, scarce perceptible, situated chiefly towards their outward side. Lastly, the hinder part of the abdomen, which projects beyond the elytra, is round and blunt. These insects are sometimes found in cow-dung, and often on sand. They vary prodigiously in size; but differ very little either in form or colour, they being all very dark. The larvæ, as well as the perfect insects, are frequently met with in the dung of horses, cows, &c.

HISTORIOGRAPHER, a professed historian, or writer of history. See the next article.

The historiographer to his majesty is an officer under the lord chamberlain; his salary 200*l. per annum*. There is an office of the same kind in Scotland, with the same salary.

Hister,
Historiographer,

H I S T O R Y.

HISTORY, in general, signifies an account of some remarkable facts which have happened in the world, arranged in the true order in which they actually took place, together with the causes to which they were owing, and the different effects they have produced, as far as can be discovered.—The word is Greek, *ιστορια*; and literally denotes a search of curious things, or a desire of knowing, or even a rehearsal of things we have seen; being formed from the verb *ιστημι*, which properly signifies to know a thing by having seen it. But the idea is now much more extensive, and is applied to the knowledge of things taken from the report of others. The origin is from the verb *ιστημι*, “I know;” and hence it is, that among the ancients several of their great men were called *polyhistores*, i. e. persons of various and general knowledge.

Sometimes, however, the word history is used to signify a description of things, as well as an account of facts. Thus Theophrastus calls his work, in which he has treated of the nature and properties of plants, an *history of plants*; and we have a treatise of Aristotle,

N^o 154.

intituled an *history of animals*; and to this day the description of plants, animals, and minerals, are called by the general name of *natural history*.

But what chiefly merits the name of history, and what is here considered as such, is an account of the principal transactions of mankind since the beginning of the world; and which naturally divides itself into two parts, namely, *civil* and *ecclesiastical*. The first contains the history of mankind in their various relations to one another, and their behaviour, for their own emolument, or that of others, in common life; the second considers them as acting, or pretending to act, in obedience to what they believe to be the will of the Supreme Being.—Civil history, therefore, includes an account of all the different states that have existed in the world, and likewise of those men who in different ages of the world have most eminently distinguished themselves either for their good or evil actions. This last part of civil history is usually termed *BIOGRAPHY*.

History is now considered as a very considerable branch of polite literature: few accomplishments are more valued than an accurate knowledge of the history

of history.

ries of different nations; and scarce any literary production is more regarded than a well-written history of any nation.

With regard to the study of history, we must consider, that all the revolutions which have happened in the world, have been owing to two causes. 1. The connections between the different states existing together in the world at the same time, or their different situations with regard to one another; and, 2. The different characters of the people who in all ages constituted these states, their different geniuses and dispositions, &c. by which they were either prompted to undertake such and such actions of themselves, or were easily induced to it by others. The person who would study history, therefore, ought in the first place to make himself acquainted with the state of the world in general in all different ages; what nations inhabited the different parts of it; what their extent of territory was; at what particular time they arose, and when they declined. He is then to inform himself of the various events which have happened to each particular nation; and, in so doing, he will discover many of the causes of those revolutions, which before he only knew as facts. Thus, for instance, a person may know the Roman history from the time of Romulus, without knowing in the least why the city of Rome happened to be built at that time. This cannot be understood without a particular knowledge of the former state of Italy, and even of Greece and Asia; seeing the origin of the Romans is commonly traced as high as Æneas, one of the heroes of Troy. But when all this is done, which indeed requires no small labour, the historian hath yet to study the genius and dispositions of the different nations, the characters of those who were the principal directors of their actions, whether kings, ministers, generals, or priests; and when this is accomplished, he will discover the causes of those transactions in the different nations which have given rise to the great revolutions above mentioned: after which, he may assume the character of one who is perfectly versed in history.

The first *outline* of history, as it may be called, is most easily obtained by the inspection of an historical chart; and that subjoined to the present treatise will answer the purpose as well as any. Along with this it will be proper to peruse a short abridgement of general history, from the creation of the world to the present time; but in this way there have been but very few attempts attended with any tolerable success. The following is collected from respectable authorities, and may serve to help the ideas of the reader on this subject.

SECT. I. *Civil History.*

HISTORY, though seemingly incapable of any natural division, will yet be found, on a nearer inspection, to resolve itself into the following periods, at each of which a great revolution took place, either with regard to the whole world, or a very considerable part of it. 1. The creation of man. 2. The flood. 3. The beginning of profane history, *i. e.* when all the fabulous relations of heroes, demi-gods, &c. were expelled from historical narrations, and men began to relate facts with some regard to truth and credibility.

VOL. VIII. Part II.

4. The conquest of Babylon by Cyrus, and the destruction of the Babylonian empire. 5. The reign of Alexander the Great, and the overthrow of the Persian empire. 6. The destruction of Carthage by the Romans, when the latter had no longer any rival capable of opposing their designs. 7. The reign of the emperor Trajan, when the Roman empire was brought to its utmost extent. 8. The division of the empire under Constantine. 9. The destruction of the western empire by the Heruli, and the settlement of the different European nations. 10. The rise of Mahomet, and the conquests of the Saracens and Turks. 11. The crusades, and all the space intervening between that time and the present.

Concerning the number of years which have elapsed since the creation of the world, there have been many disputes. The compilers of the Universal History determine it to have taken place in the year 4305 B. C. so that, according to them, the world is now in the 6096th year of its age. Others think it was created only 4000 years B. C. so that it hath not yet attained its 6000th year. Be this as it will, however, the whole account of the creation rests on the truth of the Mosaic history; and which we must of necessity accept, because we can find no other which does not either abound with the grossest absurdities, or lead us into absolute darkness. The Chinese and Egyptian pretensions to antiquity are so absurd and ridiculous, that the bare reading must be a sufficient confutation of them to every reasonable person. See the articles CHINA and EGYPT. Some historians and philosophers are inclined to discredit the Mosaic accounts, from the appearances of volcanoes, and other natural phenomena: but their objections are by no means sufficient to invalidate the authority of the sacred writings; not to mention that every one of their own systems is liable to insuperable objections. See the article EARTH. It is therefore reasonable for every person to accept of the Mosaic account of the creation as truth: but an historian is under an absolute necessity of doing it, because, without it, he is quite destitute of any standard or scale by which he might reduce the chronology of different nations to any agreement; and, in short, without receiving this account as true, it would be in a manner impossible at this day to write a general history of the world.

1. The transactions during the first period, viz. from the creation to the flood, are very much unknown, nothing indeed being recorded of them but what is to be found in the first six chapters of Genesis. In general, we know, that men were not at that time in a savage state; they had made some progress in the arts, had invented music, and found out the method of working metals. They seem also to have lived in one vast community, without any of those divisions into different nations which have since taken place, and which evidently proceeded from the confusion of languages. The most material part of their history, however, is, that having once begun to transgress the divine commands, they proceeded to greater and greater lengths of wickedness, till at last the Deity thought proper to send a flood on the earth, which destroyed the whole human race except eight persons, viz. Noah and his family. This terrible catastrophe happened, according to the Hebrew copy of the Bible, 1656 years after

the creation; according to the Samaritan copy, 1307. For the different conjectures concerning the natural causes of the flood, see the article DELUGE.

2. For the history of the second period we must again have recourse to the Scriptures, almost as much as for that of the first. We now find the human race reduced to eight persons possessed of nothing but what they had saved in the ark, and the whole world to be stored with animals from those which had been preserved along with these eight persons. In what country their original settlement was, no mention is made. The ark is supposed to have rested on Mount Ararat in Armenia*; but it is impossible to know whether Noah and his sons made any stay in the neighbourhood of this mountain or not. Certain it is, that, some time after, the whole or the greatest part of the human race were assembled in Babylonia, where they engaged in building a tower. This gave offence to the Deity; so that he punished them by confounding their language; whence the division of mankind into different nations.

According to a common opinion, Noah when dying left the whole world to his sons, giving Asia to Shem, Africa to Ham, and Europe to Japhet. But this hath not the least foundation in Scripture. By the most probable accounts, Gomer the son of Japhet was the father of the Gomerians or Celtes; that is, all the barbarous nations who inhabited the northern parts of Europe under the various names of *Gauls*, *Cimbrians*, *Goths*, &c. and who also migrated into Spain, where they were called *Celtiberians*. From Magog, Meshech, and Tubal, three of Gomer's brethren, proceeded the Scythians, Sarmatians, Tartars, and Moguls. The three other sons of Japhet, Madai, Javan, and Tiras, are said to have been the fathers of the Medes, the Ionians, Greeks, and Thracians.

The children of Shem were Elam, Ashur, Arphaxad, Lud, and Aram. The first settled in Persia, where he was the father of that mighty nation: The descendants of Ashur peopled Assyria, (now *Curdestan*): Arphaxad settled in Chaldaea. Lud is supposed by Josephus to have taken up his residence in Lydia; though this is much controverted. Aram, with more certainty, is thought to have settled in Mesopotamia and Syria.

The children of Ham were Cush, Mizraim, Phut, and Canaan. The first is thought to have remained in Babylonia, and to have been king of the south-eastern parts of it afterwards called *Khuzestan*. His descendants are supposed to have removed into the eastern parts of Arabia; from whence they by degrees migrated into the corresponding part of Africa. The second peopled Egypt, Ethiopia, Cyrenaica, Libya, and the rest of the northern parts of the same continent. The place where Phut settled is not known: but Canaan is universally allowed to have settled in Phoenicia; and to have founded those nations who inhabited Judea, and were afterwards exterminated by the Jews.

Almost all the countries of the world, at least of the eastern continent, being thus furnished with inhabitants, it is probable that for many years there would be few or no quarrels between the different nations. The paucity of their numbers, their distance from one

another, and their diversity of language, would contribute to keep them from having much communication with each other. Hence, according to the different circumstances in which the different tribes were placed, some would be more civilized and others more barbarous. In this interval, also, the different nations probably acquired different characters, which afterwards they obstinately retained, and manifested on all occasions; hence the propensity of some nations to monarchy, as the Asiatics, and the enthusiastic desire of the Greeks for liberty and republicanism, &c.

The beginning of monarchical government was very early; Nimrod the son of Cush having found means to make himself king of Babylonia. In a short time Ashur emigrated from the new kingdom; built Nineveh, afterwards capital of the Assyrian empire; and two other cities called *Rezen* and *Reboboth*, concerning the situation of which we are now much in the dark. Whether Ashur at this time set up as a king for himself, or whether he held these cities as vassal to Nimrod, is now unknown. It is probable, however, that about the same time various kingdoms were founded in different parts of the world; and which were great or small according to different circumstances. Thus the scripture mentions the kings of Egypt, Gerar, Sodom, Gomorrah, &c. in the time of Abraham; and we may reasonably suppose, that these kings reigned over nations which had existed for some considerable time before.

The first considerable revolution we read of is the migration of the Israelites out of Egypt, and their establishment in the land of Canaan. For the history of these transactions we must refer to the Old Testament, where the reader will see that it was attended with the most terrible catastrophe to the Egyptians, and with the utter extermination of some nations, the descendants of Ham, who inhabited Judaea. Whether the overthrow of Pharaoh in the Red Sea could affect the Egyptian nation in such a manner as to deprive them of the greatest part of their former learning, and to keep them for some ages after in a barbarous state, is not easily determined; but unless this was the case, it seems exceedingly difficult to account for the total silence of their records concerning such a remarkable event, and indeed for the general confusion and uncertainty in which the early history of Egypt is involved. The settlement of the Jews in the promised land of Canaan is supposed to have happened about 1491 B. C.

For near 200 years after this period we find no accounts of any other nations than those mentioned in scripture. About 1280 B. C. the Greeks began to make other nations feel the effects of that enterprising and martial spirit for which they were so remarkable, and which they had undoubtedly exercised upon one another long before. Their first enterprise was an invasion of Colchis (now *Mingrelia*), for the sake of the golden fleece. Whatever was the nature of this expedition, it is probable they succeeded in it; and it is likewise probable, that it was this specimen of the riches of Asia which inclined them so much to Asiatic expeditions ever after. All this time we are totally in the dark about the state of Asia and Africa, except in so far as can be conjectured from scripture. The ancient empires of Babylon, Assyria, and Persia, probably

the Greeks.

bably still continued in the former continent, and Egypt and Ethiopia seem to have been considerable kingdoms in the latter.

About 1184 years B. C. the Greeks again distinguished themselves by their expedition against Troy, a city of Phrygia Minor; which they plundered and burnt, massacring the inhabitants with the most unrelenting cruelty. Æneas, a Trojan prince, escaped with some followers into Italy, where he became the remote founder of the Roman empire. At this time Greece was divided into a number of small principalities, most of which seem to have been in subjection to Agamemnon king of Mycene. In the reign of Atreus, the father of this Agamemnon, the Heraclidæ, or descendants of Hercules, who had been formerly banished by Eurytheus, were again obliged to leave this country. Under their champion Hyllus they claimed the kingdom of Mycenæ as their right, pretending that it belonged to their great ancestor Hercules, who was unjustly deprived of it by Eurytheus*. The controversy was decided by single combat; but Hyllus being killed, they departed, as had been before agreed, under a promise of not making any attempt to return for 50 years. About the time of the Trojan war, also, we find the Lydians, Mysians, and some other nations of Asia Minor, first mentioned in history. The names of the Greek states mentioned during this uncertain period are, 1. Sicyon. 2. Leleg. 3. Messina. 4. Athens. 5. Crete. 6. Argos. 7. Sparta. 8. Pelasgia. 9. Theffaly. 10. Attica. 11. Phocis. 12. Locris. 13. Ozela. 14. Corinth. 15. Eleusina. 16. Elis. 17. Pilus. 18. Arcadia. 19. Egina. 20. Ithaca. 21. Cephalone. 22. Phthia. 23. Phocidia. 24. Ephyra. 25. Eolia. 26. Thebes. 27. Calista. 28. Etolia. 29. Doloppa. 30. Oechalia. 31. Mycenæ. 32. Eubœa. 33. Mynia. 34. Doris. 35. Phera. 36. Iola. 37. Trachina. 38. Thrasprocia. 39. Myrmidonia. 40. Salamine. 41. Scyros. 42. Hyperia or Melité. 43. The Vulcanian isles. 44. Megara. 45. Epirus. 46. Achaia. 47. The isles of the Egean Sea. Concerning many of these we know nothing besides their names: the most remarkable particulars concerning the rest may be found under their respective articles.

¹³
Of the
Jews.

About 1048 B. C. the kingdom of Judea under king David approached its utmost extent of power. In its most flourishing condition, however, it never was remarkable for the largeness of its territory. In this respect it scarce exceeded the kingdom of Scotland; though, according to the accounts given in scripture, the magnificence of Solomon was superior to that of the most potent monarchs on earth. This extraordinary wealth was owing partly to the spoils amassed by king David in his conquests over his various enemies, and partly to the commerce with the East Indies which Solomon had established. Of this commerce he owed his share to the friendship of Hiram king of Tyre, a city of Phœnicia, whose inhabitants were now the most famed for commerce and skill in maritime affairs of any in the whole world.

After the death of Solomon, which happened about 975 B. C. the Jewish empire began to decline, and soon after many powerful states arose in different parts of the world. The disposition of mankind in general seems now to have taken a new turn, not easily ac-

counted for. In former times, whatever wars might have taken place between neighbouring nations, we have no account of any extensive empire in the whole world, or that any prince undertook to reduce far distant nations to his subjection. The empire of Egypt indeed is said to have been extended immensely to the east, even before the days of Sesostris. Of this country, however, our accounts are so imperfect, that scarce any thing can be concluded from them. But now, as it were all at once, we find almost every nation aiming at universal monarchy, and refusing to set any bounds whatever to its ambition. The first shock given to the Jewish grandeur was the division of the kingdom into two through the imprudence of Rehoboam. This rendered it more easily a prey to Shishak king of Egypt; who five years after came and pillaged Jerusalem, and all the fortified cities of the kingdom of Judah. The commerce to the East Indies was now discontinued, and consequently the sources of wealth in a great measure stopped; and this, added to the perpetual wars between the kings of Israel and Judah, contributed to that remarkable and speedy decline which is now so easily to be observed in the Jewish affairs.

Whether this king Shishak was the Sesostris of profane writers or not, his expedition against Jerusalem as recorded in scripture seems very much to resemble the desultory conquests ascribed to Sesostris. His infantry is said to have been innumerable, composed of different African nations; and his cavalry 60,000, with 1200 chariots; which agrees pretty well with the mighty armament ascribed to Sesostris, and of which an account is given under the article EGYPT, n^o 2. There indeed his cavalry are said to have been only 24,000; but the number of his chariots are increased to 27,000; which last may not unreasonably be reckoned an exaggeration, and these supernumerary chariots may have been only cavalry: but unless we allow Sesostris to be the same with Shishak, it seems impossible to fix on any other king of Egypt that can be supposed to have undertaken this expedition in the days of Solomon.

Though the Jews obtained a temporary deliverance from Shishak, they were quickly after attacked by new enemies. In 941 B. C. one Zerah an Ethiopian invaded Judæa with an army of a million of infantry and 300 chariots; but was defeated with great slaughter by Aza king of Judah, who engaged him with an army of 580,000 men. About this time also we find the Syrians grown a considerable people, and bitter enemies both to the kings of Israel and Judah; aiming in fact at the conquest of both nations. Their kingdom commenced in the days of David, under Hadadezer, whose capital was Zobah, and who probably was at last obliged to become David's tributary, after having been defeated by him in several engagements. Before the death of David, however, one Rezon, who it seems had rebelled against Hadadezer, having found means to make himself master of Damascus, erected there a new kingdom, which soon became very powerful. The Syrian princes being thus in the neighbourhood of the two rival states of Israel and Judah (whose capitals were Samaria and Jerusalem), found it an easy matter to weaken them both, by pretending to assist the one against the other; but a detail of the transactions

Civil
History.Civil
History.15
Of the
Western
nations.

transactions between the Jews and Syrians is only to be found in the Old Testament, to which we refer. In 740 B. C. however, the Syrian empire was totally destroyed by Tiglath Pileser king of Assyria; as was also the kingdom of Samaria by Shalmaneser his successor in 721. The people were either massacred, or carried into captivity into Media, Persia, and the countries about the Caspian Sea.

While the nations of the east were thus destroying each other, the foundations of very formidable empires were laid in the west, which in process of time were to swallow up almost all the eastern ones. In Africa, Carthage was founded by a Tyrian colony, about 869 B. C. according to those who ascribe the highest antiquity to that city; but, according to others, it was founded only in 769 or 770 B. C. In Europe a very considerable revolution took place about 900 B. C. The Heraclidæ, whom we have formerly seen expelled from Greece by Atreus the father of Agamemnon, after several unsuccessful attempts, at last conquered the whole Peloponnesus. From this time the Grecian states became more civilized, and their history becomes less obscure. The institution, or rather the revival and continuance, of the Olympic games, in 776 B. C. also greatly facilitated the writing not only of their history, but that of other nations; for as each Olympiad consisted of four years, the chronology of every important event became indubitably fixed by referring it to such and such an Olympiad. In 748 B. C. or the last year of the seventh Olympiad, the foundations of the city of Rome were laid by Romulus; and, 43 years after, the Spartan state was new modelled, and received from Lycurgus those laws, by observing of which it afterwards arrived at such a pitch of splendor.

16
State of the
world at
the begin-
ning of the
third gen-
eral period.

3. With the beginning of the 28th Olympiad, or 568 B. C. commences the third general period above mentioned, when profane history becomes somewhat more clear, and the relations concerning the different nations may be depended upon with some degree of certainty. The general state of the world was at that time as follows.—The northern parts of Europe were either thinly inhabited, or filled with unknown and barbarous nations, the ancestors of those who afterwards destroyed the Roman empire. France and Spain were inhabited by the Gomerians or Celtes. Italy was divided into a number of petty states, arising partly from Gaulish and partly from Grecian colonies; among which the Romans had already become formidable. They were governed by their king Servius Tullius; had increased their city by the demolition of Alba Longa, and the removal of its inhabitants to Rome; and had enlarged their dominions by several cities taken from their neighbours. Greece was also divided into a number of small states, among which the Athenians and Spartans, being the most remarkable, were rivals to each other. The former had, about 599 B. C. received an excellent legislation from Solon, and were enriching themselves by navigation and commerce: the latter were become formidable by the martial institutions of Lycurgus; and having conquered Messina, and added its territory to their own, were justly esteemed the most powerful people in Greece. The other states of most consideration were Corinth, Thebes, Argos, and Arcadia.—In Asia great revolu-

tions had taken place. The ancient kingdom of Assyria was destroyed by the Medes and Babylonians, its capital city Nineveh utterly ruined, and the greatest part of its inhabitants carried to Babylon. Nay, the very materials of which it was built were carried off, to adorn and give strength to that stately metropolis, which was then undoubtedly the first city in the world. Nebuchadnezzar, a wise and valiant prince, now sat on the throne of Babylon. By him the kingdom of Judæa was totally overthrown in 587 B. C. Three years before this he had taken and razed the city of Tyre, and over-ran all the kingdom of Egypt. He is even said by Josephus to have conquered Spain, and reigned there nine years, after which he abandoned it to the Carthaginians; but this seems by no means probable. The extent of the Babylonian empire is not certainly known: but from what is recorded of it we may conclude, that it was not at all inferior even in this respect to any that ever existed; as the scripture tells us it was superior in wealth to any of the succeeding ones. We know that it comprehended Phœnicia, Palestine, Syria, Babylonia, Media, and Persia, and not improbably India also; and from a consideration of this vast extent of territory, and the riches with which every one of these countries abounded, we may form some idea of the wealth and power of this monarch. When we consider also, that the whole strength of this mighty empire was employed in beautifying the metropolis, we cannot look upon the wonders of that city as related by Herodotus to be at all incredible. See BABYLON; and ARCHITECTURE, n° 13. As to what passed in the republic of Carthage about this time, we are quite in the dark; there being a chasm in its history for no less than 300 years.

4. The fourth general period of history, namely, from the end of the fabulous times to the conquest of Babylon by Cyrus, is very short, including no more than 31 years. This sudden revolution was occasioned by the misconduct of Evil-merodach, Nebuchadnezzar's son, even in his father's life-time. For having, in a great hunting match on occasion of his marriage, entered the country of the Medes, and some of his troops coming up at the same time to relieve the garisons in those places, he joined them to those already with him, and without the least provocation began to plunder and lay waste the neighbouring country. This produced an immediate revolt, which quickly extended over all Media and Persia. The Medes, headed by Astyages and his son Cyaxares, drove back Evil-merodach and his party with great slaughter; nor doth it appear that they were afterwards reduced even by Nebuchadnezzar himself. The new empire continued daily to gather strength; and at last Cyrus, Astyages's grandson, a prince of great prudence and valour, being made generalissimo of the Median and Persian forces, took Babylon itself in the year 538 B. C. as related under the article BABYLON.

During this period the Romans increased in power under the wise administration of their king Servius Tullius, who, though a pacific prince, rendered his people more formidable by a peace of 20 years than his predecessors had done by all their victories. The Greeks, even at this early period, began to interfere with the Persians, on account of the Ionians or Grecian colonies in Asia Minor. These had been sub-

sians.

dued by Cræsus king of Lydia about the year 562, the time of Nebuchadnezzar's death. Whether the Lydians had been subdued by the Babylonish monarch or not, is not now to be ascertained; though it is very probable that they were either in subjection to him, or greatly awed by his power, as before his death nothing considerable was undertaken by them. It is indeed probable, that during the insanity of Nebuchadnezzar, spoken of by Daniel, the affairs of his kingdom would fall into confusion; and many of those princes whom he formerly retained in subjection would set up for themselves. Certain it is, however, that if the Babylonians did not regard Cræsus as their subject, they looked upon him to be a very faithful ally; inasmuch that they celebrated an annual feast in commemoration of a victory obtained by him over the Scythians. After the death of Nebuchadnezzar, Cræsus subdued many nations in Asia Minor, and among the rest the Ionians, as already related. They were, however, greatly attached to his government; for though they paid him tribute, and were obliged to furnish him with some forces in time of war, they were yet free from all kind of oppression. When Cyrus therefore was proceeding in his conquests of different parts of the Babylonish empire, before he proceeded to attack the capital, the Ionians refused to submit to him, though he offered them very advantageous terms. But soon after, Cræsus himself being defeated and taken prisoner, the Ionians sent ambassadors to Cyrus, offering to submit on the terms which had formerly been proposed. These terms were now refused; and the Ionians, being determined to resist, applied to the Spartans for aid. Though the Spartans at that time could not be prevailed upon to give their countrymen any assistance, they sent ambassadors to Cyrus with a threatening message; to which he returned a contemptuous answer, and then forced the Ionians to submit at discretion, five years before the taking of Babylon. Thus commenced the hatred between the Greeks and Persians; and thus we see, that in the two first great monarchies the seeds of their destruction were sown even before the monarchies themselves were established. For while Nebuchadnezzar was raising the Babylonish empire to its utmost height, his son was destroying what his father built up; and at the very time when Cyrus was establishing the Persian monarchy, by his ill-timed severity to the Greeks he made that warlike people his enemies, whom his successors were by no means able to resist, and who would probably have overcome Cyrus himself, had they united in order to attack him. The transactions of Africa during this period are almost entirely unknown; though we cannot doubt that the Carthaginians enriched themselves by means of their commerce, which enabled them afterwards to attain such a considerable share of power.

5. Cyrus having now become master of all the east, the Asiatic affairs continued for some time in a state of tranquillity. The Jews obtained leave to return to their own country, rebuild their temple, and again establish their worship, of all which an account is given in the sacred writings, though undoubtedly they must have been in a state of dependence on the Persians from that time forward. Cambyfes the successor of Cyrus added Egypt to his empire, which had either not submitted to Cyrus, or revolted soon after his death.

He intended also to have subdued the Carthaginians; but as the Phœnicians refused to supply him with ships to fight against their own countrymen, he was obliged to lay this design aside.

In 517 B. C. the Babylonians finding themselves grievously oppressed by their Persian masters, resolved to shake off the yoke, and set up for themselves. For this purpose, they took care to store their city with all manner of provisions; and when Darius Hystaspes, then king of Persia, advanced against them, they took the most barbarous method that can be imagined of preventing an unnecessary consumption of those provisions, which they had so carefully amassed. Having collected all the women, old men, and children, into one place, they strangled them without distinction, whether wives, fathers, mothers, brothers, or sisters; every one being allowed to save only the wife he liked best, and a maid servant to do the work of the house. This cruel policy did not avail them: their city was taken by treachery (for it was impossible to take it by force); after which the king caused the walls of it to be beat down from 200 to 50 cubits height, that their strength might no longer give encouragement to the inhabitants to revolt. Darius then turned his arms against the Scythians; but finding that expedition turn out both tedious and unprofitable, he directed his course eastward, and reduced all the country as far as the river Indus. In the mean time, the Ionians revolted; and being assisted by the Greeks, a war commenced between the two nations, which was not thoroughly extinguished but by the destruction of the Persian empire in 330 B. C. The Ionians, however, were for this time obliged to submit, after a war of six years; and were treated with great severity by the Persians. The conquest of Greece itself was then projected: but the expeditions for that purpose ended most unfortunately for the Persians, and encouraged the Greeks to make reprisals on them, in which they succeeded according to their utmost wishes; and had it only been possible for them to have agreed among themselves, the downfall of the Persian empire would have happened much sooner than it did. See ATHENS, SPARTA, MACEDON, and PERSIA.

In 459 B. C. the Egyptians made an attempt to recover their liberty, but were reduced after a war of six years. In 413 B. C. they revolted a second time: and being assisted by the Sidonians, drew upon the latter that terrible destruction foretold by the prophets; while they themselves were so thoroughly humbled, that they never after made any attempt to recover their liberty.

The year 403 B. C. proved remarkable for the revolt of Cyrus against his brother Artaxerxes Mnemon; in which, through his own rashness, he miscarried, and lost his life at the battle of Cunaxa in the province of Babylon. Ten thousand Greek mercenaries, who served in his army, made their way back into Greece, though surrounded on all sides by the enemy, and in the heart of a hostile country. In this retreat they were commanded by Xenophon, who has received the highest praises on account of his conduct and military skill in bringing it to a happy conclusion. Two years after, the invasions of Agesilaus king of Sparta threatened the Persian empire with total destruction; from which, however, it was relieved by his being recalled in order

21
History of the Greeks.

to defend his own country against the other Grecian states; and after this the Persian affairs continued in a more prosperous way till the time of Alexander.

During all this time, the volatile and giddy temper of the Greeks, together with their enthusiastic desire of romantic exploits, were preparing fetters for themselves, which indeed seemed to be absolutely necessary to prevent them from destroying one another. A zeal for liberty was what they all pretended; but on every occasion it appeared, that this love of liberty was only a desire of dominion. No state in Greece could bear to see another equal to itself; and hence their perpetual contests for pre-eminence, which could not but weaken the whole body, and render them an easy prey to an ambitious and politic prince, who was capable of taking advantage of those divisions. Being all equally impatient of restraint, they never could bear to submit to any regular government; and hence their determinations were nothing but the decisions of a mere mob, of which they had afterwards almost constantly reason to repent. Hence also their base treatment of those eminent men whom they ought most to have honoured; as Miltiades, Aristides, Themistocles, Alcibiades, Socrates, Phocion, &c. The various transactions between the Grecian states, though they make a very considerable figure in particular history, make none at all in a general sketch of the history of the world. We shall therefore only observe, that in 404 B. C. the Athenian power was in a manner totally broken by the taking of their city by the Spartans. In 370, that of the Spartans received a severe check from the Thebans at the battle of Leuctra; and eight years after was still further reduced by the battle of Mantinea. Epaminondas the great enemy of the Spartans was killed; but this only proved a more speedy means of subjugating all the states to a foreign, and at that time despicable, power. The Macedonians, a barbarous nation, lying to the north of the states of Greece, were two years after the death of Epaminondas reduced to the lowest ebb by the Illyrians, another nation of barbarians in the neighbourhood. The king of Macedon being killed in an engagement, Philip his brother departed from Thebes, where he had studied the art of war under Epaminondas, in order to take possession of his kingdom. Being a man of great prudence and policy, he quickly settled his own affairs; vanquished the Illyrians; and, being no stranger to the weakened situation of Greece, began almost immediately to meditate the conquest of it. The particulars of this enterprize are related under the article **MACEDON**: here it is sufficient to take notice, that by first attacking those he was sure he could overcome, by corrupting those whom he thought it dangerous to attack, by sometimes pretending to assist one state and sometimes another, and by imposing upon all as best served his turn, he at last put it out of the power of the Greeks to make any resistance, at least such as could keep him from gaining his end. In 338 B. C. he procured himself to be elected general of the Amphictyons, or council of the Grecian states, under pretence of settling some troubles at that time in Greece; but having once obtained liberty to enter that country with an army, he quickly convinced the states that they must all submit to his will. He was opposed by the Athenians and Thebans; but the intestine wars of Greece had cut off

all her great men, and no general was now to be found capable of opposing Philip with success.

The king of Macedon, being now master of all Greece, projected the conquest of Asia. To this he was encouraged by the ill success which had attended the Persians in their expeditions against Greece, the successes of the Greeks in their invasions, and the retreat of the ten thousand under Xenophon. All these events showed the weakness of the Persians, their vast inferiority to the Greeks in military skill, and how easily their empire might be overthrown by a proper union among the states.

Philip was preparing to enter upon his grand design, when he was murdered by some assassins. His son Alexander was possessed of every quality necessary for the execution of so great a plan; and his impetuosity of temper made him execute it with a rapidity unheard of either before or since. It must be confessed, indeed, that the Persian empire was now ripe for destruction, and could not in all probability have withstood an enemy much less powerful than Alexander. The Asiatics have in all ages been much inferior to the European nations in valour and military skill. They were now sunk in luxury and effeminacy; and what was worse, they seem at this period to have been seized with that infatuation and distraction of counsels which scarce ever fails to be a forerunner of the destruction of any nation. The Persian ministers persuaded their sovereign to reject the prudent advice that was given him, of distressing Alexander by laying waste the country, and thus forcing him to return for want of provisions. Nay, they even prevented him from engaging the enemy in the most proper manner, by dividing his forces; and persuaded him to put Charidemus the Athenian to death, who had promised, with 100,000 men, of whom one third were mercenaries, to drive the Greeks out of Asia. In short, Alexander met with only two checks in his Persian expedition. The one was from the city of Tyre, which for seven months resisted his utmost efforts; the other was from Memnon the Rhodian, who had undertaken to invade Macedonia. The first of these obstacles Alexander at last got over, and treated the governor and inhabitants with the utmost cruelty. The other was scarce felt; for Memnon died after reducing some of the Grecian islands, and Darius had no other general capable of conducting the undertaking. The power of the Persian empire was totally broke by the victory gained over Darius at Arbela in 331 B. C. and next year a total end was put to it by the murder of the king by Bessus one of his subjects.

The ambition of Alexander was not to be satisfied with the possession of the kingdom of Persia, or indeed of any other on earth. Nothing less than the total subjection of the world itself seemed sufficient to him; and therefore he was now prompted to invade every country of which he could only learn the name, whether it had belonged to the Persians or not. In consequence of this disposition, he invaded and reduced Hyrcania, Bactria, Sogdiana, and all that vast tract of country now called *Bukharia*. At last, having entered India, he reduced all the nations to the river Hyphasis, one of the branches of the Indus. But when he would have proceeded farther, and extended his conquests quite to the eastern extremities of Asia, his troops

troops positively refused to follow him farther, and he was constrained to return. In 323, this mighty conqueror died of a fever; without having time to settle the affairs of his vast extended empire, or even to name his successor.

While the Grecian empire thus suddenly sprung up in the east, the rival states of Rome and Carthage were making considerable advances in the west. The Romans were establishing their empire on the most solid foundations; to which their particular situation naturally contributed. Being originally little better than a parcel of lawless banditti, they were despised and hated by the neighbouring states. This soon produced wars; in which, at first from accidental circumstances, and afterwards from their superior valour and conduct, the Romans proved almost constantly victorious. The jealousies which prevailed among the Italian states, and their ignorance of their true interest, prevented them from combining against that aspiring nation, and crushing it in its infancy, which they might easily have done; while in the mean time the Romans, being kept in a state of continual warfare, became at last such expert soldiers, that no other state on earth could resist them. During the time of their kings they had made a very considerable figure among the Italian nations; but after their expulsion, and the commencement of the republic, their conquests became much more rapid and extensive. In 501 B. C. they subdued the Sabines; eight years after, the Latins; and in 399 the city of Veii, the strongest in Italy excepting Rome itself, was taken after a siege of ten years. But in the midst of their successes a sudden irruption of the Gauls had almost put an end to their power and nation at once. The city was burnt to the ground in 383 B. C. and the capitol on the point of being surprised, when the Gauls, who were climbing up the walls in the night, were accidentally discovered and repulsed*. In a short time Rome was rebuilt with much greater splendor than before, but now a general revolt and combination of the nations formerly subdued took place. The Romans, however, still got the better of their enemies; but, even at the time of the celebrated Camillus's death, which happened about 352 B. C. their territories scarce extended six or seven leagues from the capital. The republic from the beginning was agitated by those dissensions which at last proved its ruin. The people had been divided by Romulus into two classes, namely *Patricians* and *Plebeians*, answering to our nobility and commonalty. Between these two bodies were perpetual jealousies and contentions; which retarded the progress of the Roman conquests, and revived the hopes of the nations they had conquered. The tribunes of the people were perpetually opposing the consuls and military tribunes. The senate had often recourse to a dictator endowed with absolute power; and then the valour and experience of the Roman troops made them victorious: but the return of domestic seditions gave the subjugated nations an opportunity of shaking off the yoke. Thus had the Romans continued for near 400 years, running the same round of wars with the same enemies, and reaping very little advantage from their conquests, till at last matters were compounded by choosing one of the consuls from among the plebeians; and from this time chiefly we may date the prosperity of Rome, so that

Rome.* See Athens
and Sparta.

by the time that Alexander the Great died they were held in considerable estimation among foreign nations.

The Carthaginians in the mean time continued to enrich themselves by commerce; but, being less conversant in military affairs, were by no means equal to the Romans in power, though they excelled them in wealth. A new state, however, makes its appearance during this period, which may be said to have taught the Carthaginians the art of war, and by bringing them into the neighbourhood of the Romans, proved the first source of contention between these two powerful nations. This was the island of Sicily. At what time people were first settled on it, is not now to be ascertained. The first inhabitants we read of were called *Sicani*, *Siculi*, *Lastrigones*, &c. but of these we know little or nothing. In the second year of the 17th Olympiad, or 710 B. C. some Greek colonies are said to have arrived on the island, and in a short time founded several cities, of which Syracuse was the chief. The Syracusans at last subdued the original inhabitants; though it doth not appear that the latter were ever well affected to their government, and therefore were on all occasions ready to revolt. The first considerable prince, or (as he is called by the Greeks) *tyrant* of Syracuse, was Gelon, who obtained the sovereignty about the year 483 B. C. At what time the Carthaginians first carried their arms into Sicily is not certainly known; only we are assured, that they possessed some part of the island as early as 505 B. C. For in the time of the first consuls, the Romans and Carthaginians entered into a treaty chiefly in regard to matters of navigation and commerce; by which it was stipulated, that the Romans who should touch at Sardinia, or that part of Sicily which belonged to Carthage, should be received there in the same manner as the Carthaginians themselves. Whence it appears, that the dominion of Carthage already extended over Sardinia and part of Sicily: but in 28 years after, they had been totally driven out by Gelon; which probably was the first exploit performed by him. This appears from his speech to the Athenian and Spartan ambassadors who desired his assistance against the forces of Xerxes king of Persia. The Carthaginians made many attempts to regain their possessions in this island, which occasioned long and bloody wars between them and the Greeks, as related under the articles *CARTHAGE* and *SICILY*. This island also proved the scene of much slaughter and bloodshed in the wars of the Greeks with one another*. Before the year 323 B. C. however, the Carthaginians had made themselves masters of a very considerable part of the island; from whence all the power of the Greeks could not dislodge them. It is proper also to observe, that after the destruction of Tyre by Alexander the Great, almost all the commerce in the western part of the world fell to the share of the Carthaginians. Whether they had at this time made any settlements in Spain, is not known. It is certain, that they traded to that country for the sake of the silver, in which it was very rich; as they probably also did to Britain for the tin with which it abounded.

6. The beginning of the sixth period presents us with a state of the world entirely different from the foregoing. We now behold all the eastern part of the world, from the confines of Italy to the river Indus, and

6
Sixth pe-
riod. Hi-
story of the
Macedo-
nian em-
pire,
and

and beyond it, newly united into one vast empire, and at the same time ready to fall to pieces for want of a proper head; the western world filled with fierce and savage nations, whom the rival republics of Carthage and Rome were preparing to enslave as fast as they could. The first remarkable events took place in the Macedonian empire.—Alexander, as already observed, had not distinctly named any successor; but he had left behind him a victorious, and, we may say, invincible army, commanded by most expert officers, all of them ambitious of supreme authority. It is not to be supposed that peace could long be preserved in such a situation. For a number of years, indeed, nothing was to be seen or heard of but the most horrid slaughters, and wickedness of every kind; until at last the mother, wives, children, brothers, and even sisters, of Alexander were cut off; not one of the family of that great conqueror being left alive. When matters were a little settled, four new empires, each of them of no small extent, had arisen out of the empire of Alexander. Cassander, the son of Antipater, had Macedonia, and all Greece; Antigonus, Asia Minor; Seleucus had Babylon, and the eastern provinces; and Ptolemy Lagus, Egypt, and the western ones. One of these empires, however, quickly fell; Antigonus being defeated and killed by Seleucus and Lyfimachus at the battle of Ipsus, in 301 B. C. The greatest part of his dominions then fell to Seleucus: but several provinces took the opportunity of these confusions to shake off the Macedonian yoke altogether: and thus were formed the kingdoms of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia. The two most powerful and permanent empires, however, were those of Syria founded by Seleucus, and Egypt by Ptolemy Lagus. The kings of Macedon, though they did not preserve the same authority over the Grecian states that Alexander, Antipater, and Cassander, had done, yet effectually prevented them from those outrages upon one another, for which they had formerly been so remarkable. Indeed, it is somewhat difficult to determine, whether their condition was better or worse than before they were conquered by Philip; since, though they were now prevented from destroying one another, they were most grievously oppressed by the Macedonian tyrants.

27
Of the Ro-
mans and
Carthagi-
nians.

While the eastern parts of the world were thus deluged with blood, and the successors of Alexander were pulling to pieces the empire which he had established; the Romans and Carthaginians proceeded in their attempts to enslave the nations of the west. The Romans, ever engaged in war, conquered one city and state after another, till about the year 253 B. C. they had made themselves masters of almost the whole of Italy. During all this time they had met only with a single check in their conquests; and that was the invasion of Pyrrhus, king of Epirus. That ambitious and fickle prince had projected the conquest of Italy, which he fancied would be an easy matter. Accordingly, in 271 B. C. he entered that country, and maintained a war with the Romans for six years; till at last, being utterly defeated by Curius Dentatus, he was obliged to return.

The Romans had no sooner made themselves masters of Italy, than they wanted only a pretence to carry
N^o 155.

their arms out of it; and this pretence was soon found out. Being invited into Sicily to assist the Mamertines against Hiero king of Syracuse and the Carthaginians, they immediately commenced a war with the latter, which continued with the utmost fury for 23 years. The war ended greatly to the disadvantage of the Carthaginians, chiefly owing to the bad conduct of their generals; none of whom, Hamilcar Barcas alone excepted, seem to have been possessed of any degree of military skill; and the state had suffered too many misfortunes before he entered upon the command, for him or any other to retrieve it at that time. The consequence of this war was the entire loss of Sicily to the Carthaginians; and soon after, the Romans seized on the island of Sardinia.

Hamilcar perceiving that there was now no alternative, but that in a short time either Carthage must conquer Rome, or Rome would conquer Carthage, bethought himself of a method by which his country might become equal to that haughty republic. This was by reducing all Spain, in which the Carthaginians had already considerable possessions, and from the mines of which they drew great advantages. He had, therefore, no sooner finished the war with the mercenaries, which succeeded that with the Romans, than he set about the conquest of Spain. This, however, he did not live to accomplish, though he made great progress in it. His son Asdrubal continued the war with success; till at last, the Romans, jealous of his progress, persuaded him to enter into a treaty with them, by which he engaged himself to make the river Iberus the boundary of his conquests. This treaty probably was never ratified by the senate of Carthage; nor, though it had, would it have been regarded by Hannibal, who succeeded Asdrubal in the command, and had sworn perpetual enmity with the Romans. The transactions of the second Punic war are perhaps the most remarkable which the history of the world can afford. Certain it is, that nothing can show more clearly the slight foundations upon which the greatest empires are built. We now see the Romans, the nation most remarkable for their military skill in the whole world, and who, for more than 500 years, had been constantly victorious, unable to resist the efforts of one single man. At the same time we see this man, though evidently the first general in the world, lost solely for want of a slight support. In former times, the republic of Carthage supplied her generals in Sicily with hundreds of thousands, though their enterprises were almost constantly unsuccessful; but now Hannibal, the conqueror of Italy, was obliged to abandon his design, merely for want of 20 or 30,000 men. That degeneracy and infatuation, which never fails to overwhelm a falling nation, or rather which is the cause of its fall, had now infected the counsels of Carthage, and the supplies were denied. Neither was Carthage the only infatuated nation at this time. Hannibal, whose prudence never forsook him either in prosperity or adversity, in the height of his good fortune had concluded an alliance with Philip king of Macedon. Had that prince sent an army to the assistance of the Carthaginians in Italy immediately after the battle of Cannæ, there can be no doubt but the Romans would have been forced to accept of that peace

Civil
History.† See Car-
thage, n^o
125.

peace which they so haughtily refused†; and indeed, this offer of peace, in the midst of so much success, is an instance of moderation which perhaps does more honour to the Carthaginian general than all the military exploits he performed. Philip, however, could not be roused from his indolence, nor see that his own ruin was connected with that of Carthage. The Romans had now made themselves masters of Sicily: after which they recalled Marcellus, with his victorious army, to be employed against Hannibal; and the consequence at last was, that the Carthaginian armies, unsupported in Italy, could not conquer it, but were recalled into Africa, which the Romans had invaded. The southern nations seem to have been as blind to their own interest as the northern ones. They ought to have seen, that it was necessary for them to preserve Carthage from being destroyed; but, instead of this, Masinissa king of Numidia allied with the Romans, and by his means Hannibal was overcome at the battle of Zama*, which finished the second Punic war, in 188 B. C.

* See Zama.

28
Of Egypt
and Syria.

The event of the second Punic war determined the fate of almost all the other nations in the world. All this time, indeed, the empires of Egypt, Syria, and Greece, had been promoting their own ruin by mutual wars and intestine divisions. The Syrian empire was now governed by Antiochus the Great, who seems to have had little right to such a title. His empire, though diminished by the defection of the Parthians, was still very powerful; and to him Hannibal applied, after he was obliged to leave his country, as related under CARTHAGE, n^o 152. Antiochus, however, had not sufficient judgment to see the necessity of following that great man's advice; nor would the Carthaginians be prevailed upon to contribute their assistance against the nation which was soon to destroy them without any provocation. The pretence for war on the part of the Romans was, that Antiochus would not declare his Greek subjects in Asia to be free and independent states; a requisition which neither the Romans nor any other nation had a right to make. The event of all was, that Antiochus was every-where defeated, and forced to conclude a peace upon very disadvantageous terms.

29
Of Greece.

See Greece.

In Europe, matters went on in the same way; the states of Greece, weary of the tyranny of the Macedonians, entered into a resolution of recovering their liberties. For this purpose was framed the Achæan League†; but, as they could not agree among themselves, they at last came to the imprudent determination of calling in the Romans to defend them against Philip king of Macedon. This produced a war, in which the Romans were victorious. The Macedonians, however, were still formidable; and, as the intention of the Romans to enslave the whole world could no longer be doubted, Perseus, the successor of Philip, renewed the war. Through his own cowardice he lost a decisive engagement, and with it his kingdom, which submitted to the Romans in 167 B. C.

30
Destruction
of Carthage
and Co-
rinth.

Macedon being thus conquered, the next step was utterly to exterminate the Carthaginians; whose republic, notwithstanding the many disasters that had befallen it, was still formidable. It is true, the Carthaginians were giving no offence; nay, they even

made the most abject submissions to the republic of Rome: but all was not sufficient. War was declared a third time against that unfortunate state; there was now no Hannibal to command their armies, and the city was utterly destroyed 146 B. C. The same year the Romans put an end to the liberties they had pretended to grant the cities of Greece, by the entire destruction of CORINTH. See that article.

After the death of Antiochus the Great, the affairs of Syria and Egypt went on from bad to worse. The degenerate princes which filled the thrones of those empires, regarding only their own pleasures, either spent their time in oppressing their subjects, or in attempting to deprive each other of their dominions, by which means they became a more easy prey to the Romans. So far indeed were they from taking any means to secure themselves against the overgrown power of that republic, that the kings both of Syria and Egypt sometimes applied to the Romans as protectors. Their downfall, however, did not happen within the period of which we now treat.—The only other transaction which makes any considerable figure in the Syrian empire is the oppression of the Jews by Antiochus Epiphanes. After their return from the Babylonish captivity, they continued in subjection to the Persians till the time of Alexander. From that time they were subject to the kings of Egypt or Syria, as the fortune of either happened to prevail. Egypt being reduced to a low ebb by Antiochus Epiphanes, the Jews fell under his dominion; and being severely treated by him, imprudently showed some signs of joy on a report of his death. This brought him against them with a powerful army; and in 170 B. C. he took Jerusalem by storm, committing the most horrid cruelties on the inhabitants, in so much that they were obliged to hide themselves in caverns and in holes of rocks to avoid his fury. Their religion was totally abolished, their temple profaned, and an image of Jupiter Olympius set up on the altar of burnt-offerings: which profanation is thought to be the *abomination of desolation* mentioned by the prophet Daniel. This revolution, however, was of no long continuance. In 167 B. C. Mattathias restored the true worship in most of the cities of Judea; and in 165 the temple was purified, and the worship there restored by Judas Maccabæus. This was followed by a long series of wars between the Syrians and Jews, in which the latter were almost always victorious; and before these wars were finished, the destruction of Carthage happened, which puts an end to the sixth general period formerly mentioned.

7. The beginning of the seventh period presents us with a view of the ruins of the Greek empire in the declining states of Syria and Egypt; both of them much circumscribed in bounds. The empire of Syria at first comprehended all Asia to the river Indus, and beyond it; but in 312 B. C. most of the Indian provinces were by Seleucus ceded to one *Sandrocottus*, or *Androcottus*, a native, who in return gave him 500 elephants. Of the empire of Sandrocottus we know nothing farther than that he subdued all the countries between the Indus and the Ganges; so that from this time we may reckon the greatest part of India independent on the Syro-Macedonian princes. In 250 B. C. however, the empire sustained a much greater

riod. Ge-
neral state
of the
world.

loss by the revolt of the Parthians and Bactrians from Antiochus Theus. The former could not be subdued; and as they held in subjection to them the vast tract which now goes under the name of *Persia*, we must look upon their defection as an irreparable loss. Whether any part of their country was afterwards recovered by the kings of Egypt or Syria, is not very certain; nor is it of much consequence, since we are assured that in the beginning of the seventh period, i. e. 146 B. C. the Greek empires of Syria and Egypt were reduced by the loss of India, Persia, Armenia, Pontus, Bithynia, Cappadocia, Pergamus, &c. The general state of the world in 146 B. C. therefore was as follows. In Asia were the empires of India, Parthia, and Syria, with the lesser states of Armenia, Pontus, &c. above mentioned; to which we must add that of Arabia, which during the sixth period had grown into some consequence, and had maintained its independency from the days of Ishmael the son of Abraham. In Africa were the kingdoms of Egypt and Ethiopia; the Carthaginian territories, now subject to the Romans; and the kingdoms of Numidia, Mauritania, and Getulia, ready to be swallowed up by the same ambitious and insatiable power, now that Carthage was destroyed, which served as a barrier against it. To the south lay some unknown and barbarous nations, secure by reason of their situation and insignificance, rather than their strength, or distance from Rome. In Europe we find none to oppose the progress of the Roman arms, except the Gauls, Germans, and some Spanish nations. These were brave indeed; but through want of military skill, incapable of contending with such masters in the art of war as the Romans then were.

33
Conquests
of the Ro-
mans.

The Spaniards had indeed been subdued by Scipio Africanus in the time of the second Punic war: but, in 155 B. C. they revolted; and, under the conduct of one Viriathus, formerly a robber, held out for a long time against all the armies the Romans could send into Spain. Him the Consul Cæpio caused to be murdered about 138 B. C. because he found it impossible to reduce him by force. The city of Numantia defied the whole Roman power for six years longer; till at last, by dint of treachery, numbers, and perseverance, it was not taken, but the inhabitants, reduced to extremity by famine, set fire to their houses, and perished in the flames, or killed one another, so that not one remained to grace the triumph of the conqueror: and this for the present quieted the rest of the Spaniards. About the same time Attalus, king of Pergamus, left by will the Roman people heirs to all his goods; upon which they immediately seized on his kingdom as part of those goods, and reduced it to a Roman province, under the name of *Asia Proper*. Thus they continued to enlarge their dominions on every side, without the least regard to justice, to the means they employed, or to the miseries they brought upon the conquered people. In 122 B. C. the Balearic islands, now called *Majorca*, *Minorca*, and *Ivica*, were subdued, and the inhabitants exterminated; and, soon after, several of the nations beyond the Alps were obliged to submit.

In Africa the crimes of Jugurtha soon gave this ambitious republic an opportunity of conquering the kingdoms of Numidia and Mauritania: and indeed

this is almost the only war in which we find the Romans engaged where their pretensions had the least colour of justice; though in no case whatever could a nation show more degeneracy than the Romans did on this occasion. The particulars of this war are related under the articles NUMIDIA and ROME. The event of it was the total reduction of the former about the year 105 B. C. but Mauritania and Getulia preserved their liberty for some time longer.

In the east, the empire of Syria continued daily to decline; by which means the Jews not only had an opportunity of recovering their liberty, but even of becoming as powerful, or at least of extending their dominions as far, as in the days of David and Solomon. This declining empire was still farther reduced by the civil dissensions between the two brothers Antiochus Grypus and Antiochus Cyzicenus; during which the cities of Tyre, Sidon, Ptolemais, and Gaza, declared themselves independent, and in other cities tyrants started up who refused allegiance to any foreign power. This happened about 100 B. C.; and 17 years after, the whole was reduced by Tigranes king of Armenia. On his defeat by the Romans, the latter reduced Syria to a province of their empire. The kingdom of Armenia itself, with those of Pontus, Cappadocia, and Bithynia, soon shared the same fate; Pontus, the most powerful of them all, being subdued about 64 B. C. The kingdom of Judea also was reduced under the same power much about this time. This state owed the loss of its liberty to the same cause that had ruined several others, namely, calling in the Romans as arbitrators between two contending parties. The two sons of Alexander Jannæus (Hyrcaus and Aristobulus) contended for the kingdom. Aristobulus, being defeated by the party of Hyrcanus, applied to the Romans. Pompey the Great, who acted as ultimate judge in this affair, decided it against Aristobulus, but at the same time deprived Hyrcanus of all power as a king; not allowing him even to assume the regal title, or to extend his territory beyond the ancient borders of Judea. To such a length did Pompey carry this last article, that he obliged him to give up all those cities in Cœlosyria and Phœnicia which had been gained by his predecessors, and added them to the newly acquired Roman province of Syria.

Thus the Romans became masters of all the eastern parts of the world, from the Mediterranean sea to the borders of Parthia. In the west, however, the Gauls were still at liberty, and the Spanish nations bore the Roman yoke with great impatience. The Gauls infested the territories of the republic by their frequent incursions, which were sometimes very terrible; and though several attempts had been made to subdue them, they always proved insufficient till the time of Julius Cæsar. By him they were totally reduced, from the river Rhine to the Pyrenean mountains, and many of their nations almost exterminated. He carried his arms also into Germany and the southern parts of Britain; but in neither of these parts did he make any permanent conquests. The civil wars between him and Pompey gave him an opportunity of seizing on the kingdom of Mauritania and those parts of Numidia which had been allowed to retain their liberty. The kingdom of Egypt alone remained, and to this

Civil
History.Civil
History.

nothing belonged except the country properly so called. Cyrenaica was bequeathed by will to the Romans about 58 B. C.; and about the same time the island of Cyprus was seized by them without any pretence, except a desire of possessing the treasure of the king.—The kingdom of Egypt continued for some time longer at liberty; which in some measure must be ascribed to the internal dissensions of the republic, but more especially to the amours of Pompey, Julius Cæsar, and Marc Antony, with the famous Cleopatra queen of Egypt. The battle of Actium, however, determined the fate of Antony, Cleopatra, and Egypt itself; which last was reduced to a Roman province about 9 B. C.

34
Origin and
progress of
the civil
wars in
Rome.

While the Romans thus employed all means to reduce the world to their obedience, they were making one another feel the same miseries at home which they inflicted upon other nations abroad. The first civil dissensions took their rise at the siege of Numantia in Spain. We have already observed, that this small city resisted the whole power of the Romans for six years. Once they gave them a most terrible and shameful defeat, wherein 30,000 Romans fled before 4000 Numantines. Twenty thousand were killed in the battle, and the remaining ten thousand so shut up, that there was no possibility of escaping. In this extremity they were obliged to negotiate with the enemy, and a peace was concluded upon the following terms: 1. That the Numantines should suffer the Romans to retire unmolested; and, 2. That Numantia should maintain its independence, and be reckoned among the Roman allies.—The Roman senate, with an injustice and ingratitude hardly to be matched, broke this treaty, and in return ordered the commander of their army to be delivered up to the Numantines: but they refused to accept of him, unless his army was delivered along with him; upon which the war was renewed, and ended as already related. The fate of Numantia, however, was soon revenged. Tiberius Sempronius Gracchus, brother-in-law to Scipio Africanus the second, had been a chief promoter of the peace with the Numantines already mentioned, and of consequence had been in danger of being delivered up to them along with the commander in chief. This disgrace he never forgot; and, in order to revenge himself, undertook the cause of the Plebeians against the Patricians, by whom the former were greatly oppressed. He began with reviving an old law, which had enacted that no Roman citizen should possess more than 500 acres of land. The overplus he designed to distribute among those who had no lands, and to reimburse the rich out of the public treasury. This law met with great opposition, bred many tumults, and at last ended in the death of Gracchus and the persecution of his friends, several hundreds of whom were put to cruel deaths without any form of law.

The disturbances did not cease with the death of Gracchus. New contests ensued on account of the Sempronian law, and the giving to the Italian allies the privilege of Roman citizens. This last not only produced great commotions in the city, but occasioned a general revolt of the states of Italy against the republic of Rome. This rebellion was not quelled without the utmost difficulty: and in the mean time, the city was deluged with blood by the contending

factions of Sylla and Marius; the former of whom sided with the patricians, and the latter with the plebeians. These disturbances ended in the perpetual dictatorship of Sylla, about 80 B. C.

From this time we may date the loss of the Roman liberty; for though Sylla resigned his dictatorship two years after, the succeeding contests between Cæsar and Pompey proved equally fatal to the republic. These contests were decided by the battle of Pharsalia, by which Cæsar became in effect master of the empire in 43 B. C. Without loss of time he then crossed over into Africa; totally defeated the republican army in that continent; and, by reducing the country of Mauritania to a Roman province, completed the Roman conquests in these parts. His victory over the sons of Pompey at Munda 40 B. C. secured him from any further apprehensions of a rival. Being therefore sole master of the Roman empire, and having all the power of it at his command, he projected the greatest schemes; tending, according to some, not less to the happiness than to the glory of his country: when he was assassinated in the senate-house, in the 56th year of his age, and 39 B. C.

Without investigating the political justice of this action, or the motives of the perpetrators, it is impossible not to regret the death of this great man, when we contemplate his virtues, and the designs which he is said to have formed: (See ROME). Nor is it possible to justify, from ingratitude at least, even the most virtuous of the conspirators, when we consider the obligations under which they lay to him. And as to the measure itself, even in the view of expediency, it seems to be generally condemned. In fact, from the transactions which had long preceded, as well as those which immediately followed, the murder of Cæsar, it is evident, that Rome was incapable of preserving its liberty any longer, and that the people had become unfit for being free. The efforts of Brutus and Cassius were therefore unsuccessful, and ended in their own destruction and that of great numbers of their followers in the battle of Philippi. The defeat of the republicans was followed by numberless disturbances, murders, proscriptions, &c. till at last Octavianus, having cut off all who had the courage to oppose him, and finally got the better of his rivals by the victory at Actium, put an end to the republic in the year 27 B. C.

35
Octavianus
puts an end
to the re-
public.

The destruction of the Roman commonwealth proved advantageous to the few nations of the world who still retained their liberty. That outrageous desire of conquest, which had so long marked the Roman character, now in a great measure ceased; because there was now another way of satisfying the desires of ambitious men, namely, by courting the favour of the emperor. After the final reduction of the Spaniards, therefore, and the conquest of the countries of Mæsia, Pannonia, and some others adjacent to the Roman territories, and which in a manner seemed naturally to belong to them, the empire enjoyed for some time a profound peace.

The only remarkable transactions which took place during the remainder of the period of which we treat, were the conquest of Britain by Claudius and Agricola, and the destruction of Jerusalem by Vespasian and Titus. The war with the Jews began A. D. 67; and

was occasioned by their obstinately claiming the city of Cæsarea, which the Romans had added to the province of Syria. It ended in 73, with the most terrible destruction of their city and nation; since which time they have never been able to assemble as a distinct people. The southern parts of Britain were totally subdued by Agricola about ten years after.

In the 98th year of the Christian era, Trajan was created emperor of Rome; and being a man of great valour and experience in war, carried the Roman conquests to their utmost extent. Having conquered the Dacians, a German nation beyond the Danube, and who had of late been very troublesome, he turned his arms eastward; reduced all Mesopotamia, Chaldaea, Assyria; and having taken Ctesiphon, the capital of the Parthian empire, appointed them a king, which he thought would be a proper method of keeping that warlike people in subjection. After this, he proposed to return to Italy, but died by the way; and with his reign the seventh general period abovementioned is concluded.

36
Eighth period. General state of the world.

8. The beginning of the eighth period presents us with a view of one vast empire, in which almost all the nations of the world were swallowed up. This empire comprehended the best part of Britain, all Spain, France, the Netherlands, Italy, part of Germany, Egypt, Barbary, Bildulgerid, Turkey in Europe, Turkey in Asia, and Persia. The state of India at this time is unknown. The Chinese lived in a remote part of the world, unheard of and unmolested by the western nations who struggled for the empire of the world. The northern parts of Europe and Asia were filled with barbarous nations, already formidable to the Romans, and who were soon to become more so. The vast empire of the Romans, however, had no sooner attained its utmost degree of power, than, like others before it, it began to decline. The provinces of Babylonia, Mesopotamia, and Assyria, almost instantly revolted, and were abandoned by Adrian the successor of Trajan in the empire. The Parthians having recovered their liberty, continued to be very formidable enemies, and the barbarians of the northern parts of Europe continued to increase in strength; while the Romans, weakened by intestine divisions, became daily less able to resist them. At different times, however, some warlike emperors arose, who put a stop to the incursions of these barbarians; and about the year 215, the Parthian empire was totally overthrown by the Persians, who had long been subject to them. This revolution proved of little advantage to the Romans. The Persians were enemies still more troublesome than the Parthians had been; and though often defeated, they still continued to infest the empire on the east, as the barbarous nations of Europe did on the north. In 260, the defeat and captivity of the emperor Valerian by the Persians, with the disturbances which followed, threatened the empire with utter destruction. Thirty tyrants seized the government at once, and the barbarians pouring in on all sides in prodigious numbers ravaged almost all the provinces of the empire. By the vigorous conduct of Claudius, Aurelian, Tacitus, Probus, and Carus, the empire was restored to its former lustre; but as the barbarians were only repulsed, and never thoroughly subdued, this proved only a temporary relief. What was worse, the Roman soldiers, grown impatient of restraint, commonly murdered those

emperors who attempted to revive among them the ancient military discipline which alone could ensure the victory over their enemies. Under Dioclesian, the disorders were so great, that though the government was held by two persons, they found themselves unable to bear the weight of it, and therefore took other two partners in the empire. Thus was the Roman empire divided into four parts; which by all historians is said to have been productive of the greatest mischiefs. As each of the four sovereigns would have as many officers both civil and military, and the same number of forces that had been maintained by the state when governed only by one emperor, the people were not able to pay the sums necessary for supporting them. Hence the taxes and imposts were increased beyond measure, the inhabitants in several provinces reduced to beggary, the land left untilld for want of hands, &c. An end was put to these evils when the empire was again united under Constantine the Great; but in 330 a mortal blow was given to it, by removing the imperial seat to Byzantium, now Constantinople, and making it equal to Rome. The introduction and establishment of Christianity, already corrupted with the grossest superstitions, proved also a most grievous detriment to the empire. Instead of that ferocious and obstinate valour in which the Romans had so long been accustomed to put their trust, they now imagined themselves secured by signs of the cross, and other external symbols of the Christian religion. These they used as a kind of magical incantations, which undoubtedly proved at all times ineffectual; and hence also in some measure proceeded the great revolution which took place in the next period.

9. The ninth general period shows us the decline and miserable end of the western part of the Roman empire. We see that mighty empire, which formerly occupied almost the whole world, now weakened by division, and surrounded by enemies. On the east, the Persians; on the north, the Scythians, Sarmatians, Goths, and a multitude of other barbarous nations, watched all occasions to break into it; and miscarried in their attempts, rather through their own barbarity, than the strength of their enemies. The devastations committed by those barbarians when they made their incursions are incredible, and the relation shocking to human nature. Some authors seem much inclined to favour them; and even insinuate, that barbarity and ignorant ferocity were their chief if not their only faults: but from their history it plainly appears, that not only barbarity and the most shocking cruelty, but the highest degrees of avarice, perfidy, and disregard to the most solemn promises, were to be numbered among their vices. It was ever a sufficient reason for them to make an attack, that they thought their enemies could not resist them. Their only reason for making peace, or for keeping it, was because their enemies were too strong; and their only reason for committing the most horrid massacres, rapes, and all manner of crimes, was because they had gained a victory. The Romans, degenerate as they were, are yet to be esteemed much better than these savages; and therefore we find not a single province of the empire that would submit to the barbarians while the Romans could possibly defend them.

Some of the Roman emperors indeed withstood this inundation of savages; but as the latter grew daily more

37
Ninth period. Destruction of the western empire.

Civil
History.Civil
History.38
General
state of the
world.

more numerous, and the Romans continued to weaken themselves by their intestine divisions, they were at last obliged to take large bodies of barbarians into their pay, and teach them their military discipline, in order to drive away their countrymen, or others who invaded the empire. This at last proved its total destruction; for, in 476, the barbarians who served in the Roman armies, and were dignified with the title of *allies*, demanded the third part of the lands of Italy as a reward for their services: but meeting with a refusal, they revolted, and made themselves masters of the whole country, and of Rome itself, which from that time ceased to be the head of an empire of any consequence.

This period exhibits a most unfavourable view of the western parts of the world: The Romans, from the height of grandeur, sunk to the lowest slavery, nay, in all probability, almost exterminated; the provinces they formerly governed, inhabited by human beings scarce a degree above the brutes; every art and science lost; and the savage conquerors even in danger of starving for want of a sufficient knowledge of agriculture, having now no means of supplying themselves by plunder and robbery as before. Britain had long been abandoned to the mercy of the Scots and Picts; and in 450 the inhabitants had called in the Saxons to their assistance, whom they soon found worse enemies than those against whom they had implored their aid. Spain was held by the Goths and Suevians; Africa (that is, Barbary and Bildulgerid), by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected several small states in Gaul; and Italy was subjected to the Heruli under Odoacer, who had taken upon him the title of *king of Italy*. In the east, indeed, matters wore an aspect somewhat more agreeable. The Roman empire continued to live in that of Constantinople, which was still very extensive. It comprehended all Asia Minor and Syria, as far as Persia; in Africa, the kingdom of Egypt; and Greece in Europe. The Persians were powerful, and rivalled the emperors of Constantinople; and beyond them lay the Indians, Chinese, and other nations, who, unheard of by the inhabitants of the more western parts, enjoyed peace and liberty.

The Constantinopolitan empire continued to decline by reason of its continual wars with the Persians, Bulgarians, and other barbarous nations; to which also superstition and relaxation of military discipline largely contributed. The Persian empire also declined from the same causes, together with the intestine broils from which it was seldom free more than that of Constantinople. The history of the eastern part of the world during this period, therefore, consists only of the wars between these two great empires, of which an account is given under the articles CONSTANTINOPLE and PERSIA; and which were productive of no other consequence than that of weakening them both, and making them a more easy prey to those enemies who were now as it were in embryo, but shortly about to erect an empire almost as extensive as that of the Greeks or Romans.

39
History of
Italy.

Among the western nations, the revolutions, as might naturally be expected from the character of the people, succeeded one another with rapidity. The Heruli un-

der Odoacer were driven out by the Goths under Theodoric. The Goths were expelled by the Romans; and, while the two parties were contending, both were attacked by the Franks, who carried off an immense booty. The Romans were in their turn expelled by the Goths: the Franks again invaded Italy, and made themselves masters of the province of Venetia; but at last the superior fortune of the emperor of Constantinople prevailed, and the Goths were finally subdued in 553. Narses, the conqueror of the Goths, governed Italy as a province of the eastern empire till the year 568, when Longinus his successor made considerable alterations. The Italian provinces had ever since the time of Constantine the Great been governed by *consulares*, *correctores*, and *praesides*; no alteration having been made either by the Roman emperors or the Gothic kings. But Longinus, being invested with absolute power by Justinian, suppressed those magistrates; and, instead of them, placed in each city of note a governor, whom he distinguished with the title of *duke*. The city of Rome was not more honoured than any other; for Longinus, having abolished the very name of *senate* and *consuls*, appointed a *duke* of Rome as well as of other cities. To himself he assumed the title of *exarch*; and, residing at Ravenna, his government was styled the *exarchate of Ravenna*. But while he was establishing this new empire, the greatest part of Italy was conquered by the Lombards.

In France a considerable revolution also took place. In 487, Clovis, the founder of the present French monarchy, possessed himself of all the countries lying between the Rhine and the Loire. By force or treachery, he conquered all the petty kingdoms which had been erected in that country. His dominions had been divided, reunited, and divided again; and were on the point of being united a second time, when the great impostor Mahomet began to make a figure in the world.

In Spain, the Visigoths erected a kingdom ten years before the conquest of Rome by the Heruli. This kingdom they had extended eastward, about the same time that Clovis was extending his conquests to the west; so that the two kingdoms met at the river Loire. The consequence of this approach of such barbarous conquerors towards each other was an immediate war. Clovis proved victorious, and subdued great part of the country of the Visigoths, which put a final stop to their conquests on that side.

Another kingdom had been founded in the western parts of Spain by the Suevi, a considerable time before the Romans were finally expelled from that country. In 409 this kingdom was entirely subverted by Theodoric king of the Goths; and the Suevi were pent up in a small district of Lusitania and Galicia, that it seemed impossible for them to recover themselves. During the abovementioned period, however, while the attention of the Goths was turned another way, they had found means again to erect themselves into an independent state, and to become masters of considerably extended territories. But this success proved of short duration. In 584 the Goths attacked them; totally destroyed their empire a second time; and thus became masters of all Spain, except some small part which still owned subjection to the emperors.

42
Of Africa.

rors of Constantinople. Of this part, however, the Goths became masters also in the year 623; which concludes the 9th general period.

Africa, properly so called, had changed its masters three times during this period. The Vandals had expelled the Romans, and erected an independent kingdom, which was at last overturned by the emperors of Constantinople; and from them the greatest part of it was taken by the Goths in 620.

43
Tenth general period. Conquests of the Saracens.

10. At the commencement of the tenth general period (which begins with the flight of Mahomet in the year 622, from whence his followers date their era called the *Hegira*), we see every thing prepared for the great revolution which was now to take place: the Roman empire in the west annihilated; the Persian empire and that of Constantinople weakened by their mutual wars and intestine divisions; the Indians and other eastern nations unaccustomed to war, and ready to fall a prey to the first invader; the southern parts of Europe in a distracted and barbarous state; while the inhabitants of Arabia, from their earliest origin, accustomed to war and plunder, and now united by the most violent superstition and enthusiastic desire of conquest, were like a flood pent up, and ready to overwhelm the rest of the world.—The northern nations of Europe and Asia, however formidable in after-times, were at present unknown, and peaceable, at least with respect to their southern neighbours; so that there was in no quarter of the globe any power capable of opposing the conquests of the Arabs. With amazing celerity, therefore, they over-ran all Syria, Palestine, Persia, Bukharia, and India, extending their conquests farther to the eastward than ever Alexander had done. On the west side, their empire extended over Egypt, Barbary, and Spain, together with the islands of Sicily, Sardinia, Majorca, Minorca, &c. and many of the Archipelago islands: nor were the coasts of Italy itself free from their incursions; nay, they are even said to have reached the distant and barren country of Iceland. At last this great empire, as well as others, began to decline. Its ruin was very sudden, and owing to its internal divisions. Mahomet had not taken care to establish the apostleship in his family, or to give any particular directions about a successor. The consequence of this was, that the caliphate, or succession to the apostleship, was seized by many usurpers in different parts of the empire; while the true caliphs, who resided at Bagdad, gradually lost all power, and were regarded only as a kind of high-priests. Of these divisions the Turks took advantage to establish their authority in many provinces of the Mohammedan empire: but as they embraced the same religion with the Arabs, and were filled with the same enthusiastic desire of conquest, it is of little consequence to distinguish between them; as indeed it signified little to the world in general whether the Turks or Saracens were the conquerors, since both were cruel, barbarous, ignorant, and superstitious.

44
Of the Pope's temporal power.

While the barbarians of the east were thus grasping at the empire of the whole world, great disturbances happened among the no less barbarous nations of the west. Superstition seems to have been the ruling motive in both cases. The Saracens and Turks conquered for the glory of God, or of his apostle Mahomet and his successors; the western nations professed an e-

qual regard for the divine glory, but which was only to be perceived in the respect they paid to the pope and clergy. Ever since the establishment of Christianity by Constantine, the bishops of Rome had been gradually extending their power; and attempting not only to render themselves independent, but even to assume an authority over the emperors themselves. The destruction of the empire was so far from weakening their power, that it afforded them opportunities of greatly extending it, and becoming judges of the sovereigns of Italy themselves, whose barbarity and ignorance prompted them to submit to their decisions. All this time, however, they themselves had been in subjection to the emperors of Constantinople; but on the decline of that empire, they found means to get themselves exempted from this subjection. The principal authority in the city of Rome was then engrossed by the bishop; though of right it belonged to the duke appointed by the exarch of Ravenna. But tho' they had now little to fear from the eastern emperors, they were in great danger from the ambition of the Lombards, who aimed at the conquest of all Italy. This aspiring people the bishops of Rome determined to check; and therefore, in 726, when Luitprand king of the Lombards had taken Ravenna and expelled the exarch, the pope undertook to restore him. For this purpose he applied to the Venetians, who are now first mentioned in history as a state of any consequence; and by their means the exarch was restored. Some time before, a quarrel had happened between the pope (Gregory II.) and Leo emperor of the east, about the worship of images. Leo, who it seems, in the midst of so much barbarism, had still preserved some share of common sense and reason, reprobated the worship of images in the strongest terms, and commanded them to be destroyed throughout his dominions. The pope, whose cause was favoured by the most absurd superstitions, and by these only, refused to obey the emperor's commands. The exarch of Ravenna, as a subject of the emperor, was ordered to force the pope to a compliance, and even to seize or assassinate him in case of a refusal. This excited the pious zeal of Luitprand to assist the pope, whom he had formerly designed to subdue: the exarch was first excommunicated, and then torn in pieces by the enraged multitude: the duke of Naples shared the same fate; and a vast number of the *Iconoclasts*, or Image-breakers, as they were called, were slaughtered without mercy: and to complete all, the subjects of the exarchate, at the instigation of the pope, renounced their allegiance to the emperor.

Leo was no sooner informed of this revolt than he ordered a powerful army to be raised, in order to reduce the rebels, and take vengeance on the pope. Alarmed at these warlike preparations, Gregory looked round for some power on which he might depend for protection. The Lombards were possessed of sufficient force, but they were too near and too dangerous neighbours to be trusted; the Venetians, though zealous Catholics, were as yet unable to withstand the force of the empire; Spain was over-run by the Saracens: the French seemed, therefore, the only people to whom it was adviseable to apply for aid; as they were able to oppose the emperor, and were likewise enemies to his edict. Charles Martel, who at that time

Civil
History.Civil
History.

time governed France as mayor of the palace, was therefore applied to; but before a treaty could be concluded, all the parties concerned were removed by death. Constantine Copronymus, who succeeded Leo at Constantinople, not only persisted in the opposition to image-worship, begun by his predecessor, but prohibited also the invocation of saints. Zachary, who succeeded Gregory III. in the pontificate, proved as zealous an adversary as his predecessors. Pepin, who succeeded Charles Martel in the sovereignty of France, proved as powerful a friend to the pope as his father had been. The people of Rome had nothing to fear from Constantinople; and therefore drove out all the emperor's officers. The Lombards, awed by the power of France, for some time allowed the pope to govern in peace the dominions of the exarchate; but in 752, Astolphus king of Lombardy not only reduced the greatest part of the pope's territories, but threatened the city of Rome itself. Upon this an application was made to Pepin, who obliged Astolphus to restore the places he had taken, and gave them to the pope, or, as he said, to St Peter. The Greek emperor, to whom they of right belonged, remonstrated to no purpose. The pope from that time became possessed of considerable territories in Italy; which, from the manner of their donation, go under the name of *St Peter's Patrimony*. It was not, however, before the year 774 that the pope was fully secured in these new dominions. This was accomplished when the kingdom of the Lombards was totally destroyed by Charlemagne, who was thereupon crowned king of Italy. Soon after, this monarch made himself master of all the Low Countries, Germany, and part of Hungary; and in the year 800, was solemnly crowned emperor of the west by the pope.

45
General
state of the
world.

Thus was the world once more shared among three great empires. The empire of the Arabs or Saracens extended from the river Ganges to Spain; comprehending almost all of Asia and Africa which has ever been known to Europeans, the kingdoms of China and Japan excepted. The eastern Roman empire was reduced to Greece, Asia Minor, and the provinces adjoining to Italy. The empire of the west under Charlemagne, comprehended France, Germany, and the greatest part of Italy. The Saxons, however, as yet possessed Britain unmolested by external enemies, tho' the seven kingdoms erected by them were engaged in perpetual contests. The Venetians also enjoyed a nominal liberty; though it is probable that their situation would render them very much dependent on the great powers which surrounded them. Of all nations on earth, the Scots and Picts, and the remote ones of China and Japan seem to have enjoyed, from their situation, the greatest share of liberty; unless, perhaps, we except the Scandinavians, who, under the names of *Danes* and *Normans*, were soon to infest their southern neighbours. But of all the European potentates, the popes certainly exercised the greatest authority; since even Charlemagne himself submitted to accept the crown from their hands, and his successors made them the arbiters of their differences.

Matters, however, did not long continue in this state. The empire of Charlemagne was on the death of his son Lewis divided among his three children. Endless disputes and wars ensued among them, till at

last the sovereign power was seized by Hugh Capet in 987. The Saxon heptarchy was dissolved in 827, and the whole kingdom of England reduced under one head. The Danes and Normans began to make depredations, and infest the neighbouring states. The former conquered the English Saxons, and seized the government, but were in their turn expelled by the Normans in 1066. In Germany and Italy the greatest disturbances arose from the contests between the popes and the emperors. To all this if we add the internal contests which happened through the ambition of the powerful barons of every kingdom, we can scarce form an idea of times more calamitous than those of which we now treat. All Europe, nay, all the world, was one great field of battle; for the empire of the Mahometans was not in a more settled state than that of the Europeans. Caliphs, sultans, emirs, &c. waged continual war with each other in every quarter; new sovereignties every day sprung up, and were as quickly destroyed. In short, thro' the ignorance and barbarity with which the whole world was overspread, it seemed in a manner impossible that the human race could long continue to exist; when happily the crusades, by directing the attention of the Europeans to one particular object, made them in some measure suspend their slaughters of one another.

11. The crusades originated from the superstition of the two grand parties into which the world was at that time divided, namely, the Christians and Mahometans. Both looked upon the small territory of Palestine, which they called the *Holy Land*, to be an invaluable acquisition, for which no sum of money could be an equivalent; and both took the most unjustifiable methods to accomplish their desires. The superstition of Omar the second caliph had prompted him to invade this country, part of the territories of the Greek emperor, who was doing him no hurt; and now when it had been so long under the subjection of the Mahometans, a similar superstition prompted the pope to send an army for the recovery of it. The crusaders accordingly poured forth in multitudes, like those with which the kings of Persia formerly invaded Greece; and their fate was pretty similar. Their impetuous valour at first, indeed, carried every thing before them: they recovered all Palestine, Phœnicia, and part of Syria, from the infidels; but their want of conduct soon lost what their valour had obtained, and very few of that vast multitude which had left Europe ever returned to their native countries. A second, a third, and several other crusades, were preached, and were attended with a like success in both respects: vast numbers took the cross, and repaired to the Holy Land; which they polluted by the most abominable massacres and treacheries, and from which very few of them returned. In the third crusade Richard I. of England was embarked, who seems to have been the best general that ever went into the east: but even his valour and skill were not sufficient to repair the faults of his companions; and he was obliged to return even after he had entirely defeated his antagonists, and was within sight of Jerusalem.

sades.

But while the Christians and Mahometans were thus superstitiously contending for a small territory in the western parts of Asia, the nations in the more easterly parts were threatened with total extermination. Jen-
ghiz

47
Conquests
of the Mo-
guls.

Jenghiz Khan, the greatest as well as the most bloody conqueror that ever existed, now makes his appearance. The rapidity of his conquests seemed to emulate those of Alexander the Great; and the cruelties he committed were altogether unparalleled. It is worth observing, that Jenghiz Khan and all his followers were neither Christians nor Mahometans, but strict deists. For a long time even the sovereign had not heard of a temple, or any particular place on earth appropriated by the deity to himself, and treated the notion with ridicule when it was first mentioned to him.

The Moguls, over whom Jenghiz Khan assumed the sovereignty, were a people of East Tartary, divided into a great number of petty governments as they are at this day, but who owned a subjection to one sovereign, whom they called *Vang-khan*, or the Great Khan. Temujin, afterwards *Jenghiz-Khan*, was one of these petty princes; but unjustly deprived of the greatest part of his inheritance at the age of 13, which he could not recover till he arrived at that of 40. This corresponds with the year 1201, when he totally reduced the rebels; and as a specimen of his lenity caused 70 of their chiefs to be thrown into as many caldrons of boiling water. In 1202, he defeated and killed Vang-khan himself (known to the Europeans by the name of *Prefter John of Asia*); and possessing himself of his vast dominions, became from thenceforward altogether irresistible. In 1206, having still continued to enlarge his dominions, he was declared khan of the Moguls and Tartars; and took upon him the title of *Jenghiz Khan*, or *The most Great Khan of khans*. This was followed by the reduction of the kingdom of Hya in China, Tangut, Kitay, Turkestan, Karazm (the kingdom of *GAZNA* founded by Mahmud Gazni), Great Bukharia, Persia, and part of India; and all these vast regions were reduced in 26 years. The devastations and slaughters with which they were accompanied are unparalleled, no fewer than 14,470,000 persons being computed to have been massacred by Jenghiz Khan during the last 22 years of his reign. In the beginning of 1227 he died, thereby freeing the world from a most bloody tyrant. His successors completed the conquest of China and Korea; but were foiled in their attempts on Cochin-china, Tong-king, and Japan. On the western side the Tartar dominions were not much enlarged till the time of Hulaku, who conquered Media, Babylonia, Mesopotamia, Assyria, Syria, Georgia, Armenia, and almost all Asia Minor; putting an end to the empire of the Saracens by the taking of Bagdad in 1258.

The empire of Jenghiz Khan had the fate of all others. Being far too extensive to be governed by one head, it split into a multitude of small kingdoms, as it had been before his time. All these princes, however, owned allegiance to the family of Jenghiz Khan till the time of Timur Bek, or Tamerlane. The Turks, in the mean time, urged forward by the inundation of Tartars who poured in from the east, were forced upon the remains of the Greek empire; and at the time of Tamerlane above-mentioned, they had almost confined this once mighty empire within the walls of Constantinople.

lane.

In the year 1335, the family of Jenghiz Khan becoming extinct in Persia, a long civil war ensued; du-
N° 155.

ring which Timur Bek, one of the petty princes among which the Tartar dominions were divided, found means to aggrandize himself in a manner similar to what Jenghiz Khan had done about 150 years before. Jenghiz Khan, indeed, was the model whom he proposed to imitate; but it must be allowed that Timur was more merciful than Jenghiz Khan, if indeed the word can be applied to such inhuman tyrants. The plan on which Jenghiz Khan conducted his expeditions was that of total extermination. For some time he utterly extirpated the inhabitants of those places which he conquered, designing to people them anew with his Moguls; and in consequence of this resolution, he would employ his army in beheading 100,000 prisoners at once. Timur's cruelty, on the other hand, seldom went farther than the pounding of 3000 or 4000 people in large mortars, or building them among bricks and mortar into a wall. We must observe, however, that Timur was not a deist, but a Mahometan, and conquered expressly for the purpose of spreading the Mahometan religion; for the Moguls had now adopted all the superstitions and absurdities of Mahomet. Thus was all the eastern quarter of the world threatened anew with the most dreadful devastations, while the western nations were exhausting themselves in fruitless attempts to regain the Holy Land. The Turks were the only people who seem at this period to have been gathering strength, and by their perpetual encroachments threatened to swallow up the western nations as the Tartars had done the eastern ones.

In 1362, Timur invaded Bukharia, which he reduced in five years. He proceeded in his conquests, though not with the same celerity as Jenghiz Khan, till the year 1387, when he had subdued all Persia, Armenia, Georgia, Karazm, and great part of Tartary. After this he proceeded westward, subduing all the countries to the Euphrates; made himself master of Bagdad; and even entered Russia, where he pillaged the city of Moscow. From thence he turned his arms to the east, and totally subdued India. In 1393, he invaded and reduced Syria; and having turned his arms against the Turks, forced their sultan Bajazet to raise the siege of Constantinople. This brought on an engagement, in which Bajazet was entirely defeated and taken prisoner; which broke the power of the Turks to such a degree, that they were not for some time able to recover themselves. At last this great conqueror died in the year 1405, while on his way to conquer China, as Jenghiz Khan had done before him.

The death of Timur was followed almost immediately by the dissolution of his empire. Most of the nations he had conquered recovered their liberty. The Turks had now no further obstacle to their conquest of Constantinople. The western nations having exhausted themselves in the *holy wars*, as they were called, had lost that insatiable thirst after conquest which for so long time possessed the minds of men. They had already made considerable advances in civilization, and began to study the arts of peace. Gunpowder was invented, and its application to the purposes of war already known; and, though no invention threatened to be more destructive, perhaps none was ever more beneficial to the human race. By the use
of

49
State of the
world since
that time.

of fire-arms, nations are put more on a level with each other than formerly they were; war is reduced to a regular system, which may be studied with as much success as any other science. Conquests are not now to be made with the same ease as formerly; and hence the last ages of the world have been much more quiet and peaceable than the former ones. In 1453, the conquest of Constantinople by the Turks fixed that wandering people to one place; and though now they possess very large regions both in Europe, Asia, and Africa, an effectual stop hath long been put to their further progress.

About this time, also, learning began to revive in Europe, where it had been long lost; and the invention of PRINTING, which happened about the same time, rendered it in a manner impossible for barbarism ever to take place in such a degree as formerly. All nations of the world, indeed, seem now at once to have laid aside much of their former ferocity; and, though wars have by no means been uncommon, they have not been carried on with such circumstances of fury and savage cruelty as before. Instead of attempting to enrich themselves by plunder, and the spoils of their neighbours, mankind in general have applied themselves to commerce, the only true and durable source of riches. This soon produced improvements in navigation; and these improvements led to the discovery of many regions formerly unknown. At the same time, the European powers, being at last thoroughly sensible that extensive conquests could never be permanent, applied themselves more to provide for the security of those dominions which they already possessed, than to attempt the conquest of one another: and this produced the policy to which so much attention was lately paid, namely, the *preserving of the balance of Europe*; that is, preventing any one of the nations from acquiring sufficient strength to overpower another.

In the end of the 15th century, the vast continent of America was discovered; and, almost at the same time, the passage to the East-Indies by the Cape of Good-Hope. The discovery of these rich countries gave a new turn to the ambition of the Europeans. To enrich themselves, either by the gold and silver produced in these countries, or by traffic with the natives, now became the object. The Portuguese had the advantage of being the first discoverers of the eastern, and the Spaniards of the western countries. The former did not neglect so favourable an opportunity of enriching themselves by commerce. Many settlements were formed by them in the East-India islands, and on the continent; but their avarice and perfidious behaviour towards the natives proved at last the cause of their total expulsion. The Spaniards enriched themselves by the vast quantities of the precious metals imported from America, which were not obtained but by the most horrid massacres committed on the natives, and of which an account is given under the different names of the American countries. These possessions of the Spaniards and Portuguese soon excited other European nations to make attempts to share with them in their treasures, by planting colonies in different parts of America, and making settlements in the East-Indies: and thus has the rage of war in some measure been transferred from Europe to these distant regions; and, after various contests, the British at last

VOL. VIII. Part II.

obtained a great superiority both in America and the East-Indies.

In Europe the only considerable revolutions which happened during this period, were, The total expulsion of the Moors and Saracens from Spain, by the taking of Grenada in 1491; the union of the kingdoms of Arragon and Castile, by the marriage of Ferdinand and Isabella; and the revolt of the states of Holland from the Spaniards. After much contention and bloodshed, these last obtained their liberty, and were declared a free people in 1609; since which time they have continued an independent and very considerable nation of Europe.

In Asia nothing of importance hath happened since the taking of Constantinople by the Turks. That continent is now divided among the following nations. The most northerly part, called *Siberia*, extending to the very extremity of the continent, is under the power of Russia. To the southward, from Asia Minor to China and Korea, are the Tartars, formidable indeed from their numbers, but, by reason of their barbarity and want of union, incapable of attempting any thing. The Turks possess the western part of the continent called *Asia Minor*, to the river Euphrates. The Arabs are again confined within their own peninsula; which they possess, as they have ever done, without owning subjection to any foreign power. To the east of Turkey in Asia lies Persia, now more confined in its limits than before; and to the eastward of Persia lies India, or the kingdom late of the Mogul, comprehending all the country from the Indus to the Ganges, and beyond that river. Still farther to the east lie the kingdoms of Siam, Pegu, Thibet, and Cochin-China, little known to the Europeans. The vast empire of China occupies the most easterly part of the continent; while that of Japan comprehends the islands which go by that name, and which are supposed to lie at no great distance from the western coasts of America.

In Africa the Turks possess Egypt, which they conquered in 1517, and have a nominal jurisdiction over the states of Barbary. The interior parts are filled with barbarous and unknown nations, as they have always been. On the western coasts are many settlements of the European nations, particularly the British and Portuguese; and the southern extremity is possessed by the Dutch. The eastern coasts are almost totally unknown. The Asiatic and African islands are either possessed by the Europeans, or inhabited by savage nations.

The European nations at the beginning of the 17th century were, Sweden, Muscovy, Denmark, Poland, Britain, Germany, Holland, France, Spain, Portugal, Italy, and Turkey in Europe. Of these the Russians, though the most barbarous, were by far the most considerable, both in regard to numbers and the extent of their empire; but their situation made them little feared by the others, who lay at a distance from them. The kingdom of Poland, which was first set up in the year 1000, proved a barrier betwixt Russia and Germany; and at the same time the policy above mentioned, of keeping up the balance of power in Europe, rendered it probable that no one European nation, whatever wars it might be engaged in, would have been totally destroyed, or ceased to exist

as a distinct kingdom. The late dismemberment of Poland, however, or its partition between the three powers Russia, Hungary, and Prussia, was a step very inconsistent with the above political system; and it is surprising with what tameness it was acquiesced in by the other powers. Subsequent circumstances, particularly the passiveness with which the ambitious designs of Russia against the Porte have been so long beheld, seem to indicate a total dereliction of that scheme of equilibrium, formerly so wisely, though perhaps sometimes too anxiously, attended to.

The revolt of the British colonies in America, it was hoped by the enemies of Britain, would have given a fatal shock to her strength and wonted superiority. The consequences, however, have been very different. Those colonies, it is true, have been disjoined from the mother-country, and have attained an independent rank among the nations. But Britain has had no cause to repine at the separation. Divested only of a splendid encumbrance, an expensive and invidious appanage, she has been left to enjoy the undivided benefits of her native vigour, and to display new energies, which promise her mild empire a long and prosperous duration. On the other hand, the flame which was to have blazed only to her prejudice, has brought confusion on her chief foe; and the ambition and tyranny of that branch of the house of Bourbon which has been long the pest of Europe, now lie humbled in the dust. The French, indeed, have thus become a nation of freemen as well as ourselves, and as well as the Americans; who, by the way, were never otherwise, nor ever knew what oppression was except in inflicting it upon their African brethren. But neither is the French revolution an event which Britons, as lovers of liberty and friends to the rights of mankind, should regret; or which, even in a political view, if duly considered, ought to excite either their jealousy or apprehension. In fine, we seem to be advancing to a great era in the history of human affairs. The emancipation of France, it is not to be doubted, will in time be followed by that of Spain and other countries of Europe. The papal power, too, that scourge of nations, is declining; and the period seems to be approaching when the Roman pontiff will be reduced to his original and simple title of *bishop of Rome*. More liberal ideas both in politics and religion are every where gaining ground. The regulation, and perhaps in time the abolition, of the slave-trade, with the endeavours of the societies for discovering Africa, may lead to the civilization of some parts of that immense continent, and open new markets for our manufactures. Finally, the Americans approach fast to a settled government; and will probably then become a great commercial people.

SECT. II. Ecclesiastical History.

50
Revolutions in religion seldom happen.

THE history of religion, among all the different nations that have existed in the world, is a subject no less important and interesting than that of civil history. It is, however, less fertile of great events, affords an account of fewer revolutions, and is much more uniform, than civil history. The reason of this is plain. Religion is conversant about things which cannot be seen; and which of consequence cannot suddenly and strongly affect the senses of mankind, as

natural things are apt to do. The expectation of worldly riches can easily induce one nation to attack another; but it is not easy to find any thing which will induce a nation to change its religion. The invisible nature of spiritual things, the prejudice of habit and of early education, all stand in the way of changes of this kind. Hence the revolutions in religion have been but few, and the duration of almost any religion of longer standing than the most celebrated empires; the changes which have happened, in general have acquired a long time to bring them about, and history scarce affords an instance of the religion of any nation being essentially and suddenly changed for another.

With regard to the origin of religion, we must have recourse to the Scriptures; and are as necessarily constrained to adopt the account there given, as we are to adopt that of the creation given in the same book; namely, because no other hath made its appearance which seems in any degree rational, or consistent with itself.—In what manner the true religion given to Adam was falsified or corrupted by his descendants before the flood, doth not clearly appear from Scripture. Idolatry is not mentioned: nevertheless we are assured that the inhabitants of the world were then exceedingly wicked; and as their wickedness did not consist in worshipping false gods, it may be concluded that they worshipped none at all; i. e. that the crime of the antediluvians was deism or atheism.

After the flood, idolatry quickly made its appearance; but what gave rise to it is not certainly known. This superstition indeed seems to be natural to man, especially when placed in such a situation that he hath little opportunity of instruction, or of improving his rational faculties. This seems also probable from a caution given to the Jews, lest, when they looked up to the sun, moon, and stars, and the rest of the host of heaven, they should be *driven to worship them*. The origin of idolatry among the Syrians and Arabians, and also in Greece, is therefore accounted for with great probability in the following manner by the author of *The Ruins of Balbeck*. “In those uncomfortable deserts, where the day presents nothing to the view but the uniform, tedious, and melancholy prospect of barren sands, the night discloses a most delightful and magnificent spectacle, and appears arrayed with charms of the most attractive kind. For the most part unclouded and serene, it exhibits to the wondering eye the host of heaven in all their variety and glory. In the view of this stupendous scene, the transition from admiration to idolatry was too easy to un instructed minds; and a people whose climate offered no beauties to contemplate but those of the firmament, would naturally look thither for the objects of their worship. The form of idolatry in Greece was different from that of the Syrians; which perhaps may be attributed to that smiling and variegated scene of mountains, valleys, rivers, woods, groves, and fountains, which the transported imagination, in the midst of its pleasing astonishment, supposed to be the seats of invisible deities.”

A difficulty, however, arises on this supposition; for if idolatry is naturally produced in the mind of un instructed and savage man from a view of the creation, why hath not idolatry of some kind or other taken

51
Origin of idolatry.

taken place among all the different nations of the world? This certainly hath not been the case; of which the most striking examples are the Persians of old, and the Moguls in more modern times. Both these nations were strict deists: so that we must allow some other causes to concur in producing idolatry besides these already mentioned; and of these causes an imperfect and obscure notion of the true religion seems to be the most probable.

Though idolatry, therefore, was formerly very prevalent, it neither extended over the whole earth, nor were the superstitions of the idolaters all of one kind. Every nation had its respective gods, over which one more excellent than the rest was said to preside; yet in such a manner, that this supreme deity himself was controuled by the rigid empire of the fates, or by what philosophers called *eternal necessity*. The gods of the east were different from those of the Gauls, the Germans, and the other northern nations. The Grecian divinities differed widely from those of the Egyptians, who deified plants, animals, and a great variety of the productions both of nature and art. Each people also had their own particular manner of worshipping and appeasing their respective deities, entirely different from the sacred rites of other countries. All this variety of religions, however, produced neither wars nor dissensions among the different nations; each nation suffered its neighbours to follow their own method of worship, without discovering any displeasure on that account. There is nothing surprising in this mutual toleration, when we consider, that they all looked upon the world as one great empire, divided into various provinces, over each of which a certain order of divinities presided; for which reason they imagined that none could behold with contempt the gods of other nations, or force strangers to pay homage to theirs.---The Romans exercised this toleration in the most ample manner; for though they would not allow any change to be made in the religions that were publicly professed in the empire, nor any new form of worship to be openly introduced, yet they granted to their citizens a full liberty of observing in private the sacred rites of other nations, and of honouring foreign deities as they thought proper.

The heathen deities were honoured with rites and sacrifices of various kinds, according to their respective natures and offices. Their rites were absurd and ridiculous; while the priests, appointed to preside over this strange worship, abused their authority, by deceiving and imposing upon the people in the grossest manner.

From the time of the flood to the coming of Christ, idolatry prevailed among almost all the nations of the world, the Jews alone excepted; and even they were on all occasions ready to run into it, as is evident from their history in the Old Testament. At the time of Christ's appearance, the religion of the Romans, as well as their empire, extended over a great part of the world. Some people there were among the heathens who perceived the absurdities of that system; but being destitute of means, as well as of abilities, to effect a reformation, matters went on in their old way. Though there were at that time various sects of philosophers, yet all of them proceeded upon false principles, and consequently could be of

no service to the advancement or reformation of religion. Nay, some, among whom were the Epicureans and Academics, declared openly against every kind of religion whatever.

Two religions at this time flourished in Palestine, viz. The Jewish and Samaritan; between whose respective followers reigned the most violent hatred and contempt. The difference between them seems to have been chiefly about the place of worship; which the Jews would have to be in Jerusalem, and the Samaritans on mount Gerizzim. But though the Jews were certainly right as to this point, they had greatly corrupted their religion in other respects. They expected a Saviour indeed, but they mistook his character; imagining that he was to be a powerful and warlike prince, who should set them free from the Roman yoke, which they bore with the utmost impatience. They also imagined that the whole of religion consisted in observing the rites of Moses, and some others which they had added to them, without the least regard to what is commonly called *morality* or *virtue*; as is evident from the many charges our Saviour brings against the Pharisees, who had the greatest reputation for sanctity among the whole nation. To these corrupt and vicious principles they added several absurd and superstitious notions concerning the divine nature, invisible powers, magic, &c. which they had partly imbibed during the Babylonian captivity, and partly derived from their neighbours in Arabia, Syria, and Egypt. The principal sects among them were the ESSENEs or Essenians, PHARISEES, and SADUCEES. The Samaritans, according to the most general opinion, had corrupted their religion still more than the Jews.

When the true religion was preached by the Saviour of mankind, it is not to be wondered at if he became on that account obnoxious to a people so deeply sunk in corruption and ignorance as the Jews then were. It is not here requisite to enter into the particulars of the doctrine advanced by him, or of the opposition he met with from the Jews; as a full account of these things, and likewise of the preaching of the gospel by the Apostles, may be found in the New Testament.—The rapid progress of the Christian religion, under these faithful and inspired ministers, soon alarmed the Jews, and raised various persecutions against its followers. The Jews, indeed, seem at first to have been every where the chief promoters of persecution; for we find that they officiously went from place to place, wherever they heard of the increase of the gospel, and by their calumnies and false suggestions endeavoured to excite the people against the Apostles. The Heathens, however, though at first they showed no very violent spirit of persecution against the Christians, soon came to hate them as much as the Jews themselves. Tacitus acquaints us with the causes of this hatred, when speaking of the first general persecution under Nero. That inhuman emperor having, as was supposed, set fire to the city of Rome, to avoid the imputation of this wickedness, transferred it on the Christians. Our author informs us that they were already

pestilent superstition was for a while suppressed: but it revived again, and spread, not only over Judæa, where this evil was first broached, but reached Rome, whither from every quarter of the earth is constantly flowing whatever is hideous and abominable amongst men, and is there readily embraced and practised. First, therefore, were apprehended such as openly avowed themselves to be of that sect; then by them were discovered an immense multitude; and all were convicted, not of the crime of burning Rome, but of hatred and enmity to mankind. Their death and tortures were aggravated by cruel derision and sport; for they were either covered with the skins of wild beasts and torn in pieces by devouring dogs, or fastened to crosses, or wrapped up in combustible garments, that, when the day-light failed, they might, like torches, serve to dispel the darkness of the night. Hence, towards the miserable sufferers, however guilty and deserving the most exemplary punishment, compassion arose; seeing they were doomed to perish, not with a view to the public good, but to gratify the cruelty of one man."

That this account of Tacitus is downright misrepresentation and calumny, must be evident to every one who reads it. It is impossible that any person can be convicted of hatred and enmity to mankind, without specifying a number of facts by which this hatred shewed itself. The burning of Rome would indeed have been a very plain indication of enmity to mankind; but of this Tacitus himself clears them, and mentions no other crime of which they were guilty. It is probable, therefore, that the only reason of this charge against the Christians, was their absolute refusal to have any share in the Roman worship, or to countenance the absurd superstitions of Paganism in any degree.

55
Second per-
secution.

The persecution under Nero was succeeded by another under Domitian; during which the Apostle John was banished to Patmos, where he saw the visions, and wrote the book called his *Revelations*, which completes the canon of Scripture. This persecution commenced in the 95th year of the Christian era; and John is supposed to have written his Revelation the year after, or in the following one.

During the first century, the Christian religion spread over a great number of different countries; but as we have now no authentic records concerning the travels of the Apostles, or the success which attended them in their ministry, it was impossible to determine how far the gospel was carried during this period. We are, however, assured, that even during this early period many corruptions were creeping in, the progress of which was with difficulty prevented even by the apostles themselves. Some corrupted their profession by a mixture of Judaism, others by mixing it with the oriental philosophy; while others were already attempting to deprive their brethren of liberty, setting themselves up as eminent pastors, in opposition even to the apostles, as we learn from the epistles of St Paul, and the third epistle of St John. Hence arose the sects of the Gnostics, Cerinthians, Nicolaitans, Nazarenes, Ebionites, &c. with which the church was troubled during this century.

Concerning the ceremonies and method of worship used by the Christians of the first century, it is impos-

sible to say any thing with certainty. Neither is the church order, government, and discipline, during this period, ascertained with any degree of exactness. Each of those parties, therefore, which exist at this day, contends with the greatest earnestness for that particular mode of worship which they themselves have adopted; and some of the most bigoted would willingly monopolize the word *church* in such a manner as to exclude from all hope of salvation every one who is not attached to their particular party. It doth not however appear that, excepting baptism, the Lord's supper, and anointing the sick with oil, any external ceremonies or symbols were properly of divine appointment. According to Dr Mosheim, "there are several circumstances which incline us to think, that the friends and apostles of our blessed Lord either tolerated through necessity, or appointed for wise reasons, many other external rites in various places. At the same time, we are not to imagine, that they ever conferred upon any person a perpetual, indelible, pontifical authority, or that they enjoined the same rites in all churches. We learn, on the contrary, from authentic records, that the Christian worship was from the beginning celebrated in a different manner in different places; and that, no doubt, by the orders, or at least with the approbation, of the apostles and their disciples. In those early times, it was both wise and necessary to shew, in the establishment of outward forms of worship, some indulgence to the ancient opinions, manners, and laws, of the respective nations to whom the gospel was preached."

The second century commences with the third year of the emperor Trajan. The Christians were still persecuted; but as the Roman emperors were for the most part of this century princes of a mild and moderate turn, they persecuted less violently than formerly. Marcus Aurelius, notwithstanding the clemency and philosophy for which he is so much celebrated, treated the Christians worse than Trajan, Adrian, or even Severus himself did, who was noted for his cruelty. This respite from rigorous persecution proved a very favourable circumstance for the spreading of the Christian religion; yet it is by no means easy to point out the particular countries through which it was diffused. We are, however, assured, that in the second century, Christ was worshipped as God almost through the whole east; as also among the Germans, Spaniards, Celtes, and many other nations: but which of them received the gospel in the first century, and which in the second, is a question unanswerable at this distance of time. The writers of this century attribute the rapid progress of Christianity chiefly to the extraordinary gifts that were imparted to the first Christians, and the miracles which were wrought at their command; without supposing that any part of the success ought to be ascribed to the intervention of human means, or secondary causes. Many of the moderns, however, are so far from being of this opinion, that they are willing either to deny the authenticity of all miracles said to have been wrought since the days of the apostles, or to ascribe them to the power of the devil. To enter into the particulars of this controversy is foreign to our present purpose; for which reason we must refer to the writers of polemic divinity, who have largely treated of this and other points of a similar nature.

56
History of
the second
century.

The

Ecclesi-
astical
History.Ecclesi-
astical
History.57
Ceremonies
multiplied.

The corruptions which had been introduced in the first century, and which were almost coeval with Christianity itself, continued to gain ground in the second. Ceremonies, in themselves futile and useless, but which must be considered as highly pernicious when joined to a religion incapable of any other ornament than the upright and virtuous conduct of its professors, were multiplied for no other purpose than to please the ignorant multitude. The immediate consequence of this was, that the attention of Christians was drawn aside from the important duties of morality; and they were led to imagine, that a careful observance of the ceremonies might make amends for the neglect of moral duties. This was the most pernicious opinion that could possibly be entertained; and was indeed the very foundation of that enormous system of ecclesiastical power which afterwards took place, and held the whole world in slavery and barbarism for many ages.

58
Mysteries
introduced.

Another mischief was the introduction of *mysteries*, as they were called, into the Christian religion; that is, insinuating that some parts of the worship in common use had a hidden efficacy and power far superior to the plain and obvious meaning assigned to them by the vulgar: and by paying peculiar respect to these mysteries, the pretended teachers of the religion of Jesus accommodated their doctrines to the taste of their heathen neighbours, whose religion consisted in a heap of mysteries, of which nobody knew the meaning.

59
The teachers
assume
a power
over the
people.

By these, and other means of a similar kind, the Christian pastors greatly abridged the liberty of their flock. Being masters of the ceremonies and mysteries of the Christian religion, they had it in their power to make their followers worship and believe whatever they thought proper; and this they did not fail to make use of for their own advantage. They persuaded the people, that the ministers of the Christian church succeeded to the character, rights, and privileges, of the Jewish priesthood; and accordingly the bishops considered themselves as invested with a rank and character similar to those of the high-priest among the Jews, while the presbyters represented the priests, and the deacons the Levites. This notion, which was first introduced in the reign of Adrian, proved a source of very considerable honour and profit to the clergy.

60
Form of
church go-
vernment.

The form of ecclesiastical government was in this century rendered permanent and uniform. One inspector or bishop presided over each Christian assembly, to which office he was elected by the voices of the whole people. To assist him in his office, he formed a council of presbyters, which was not confined to any stated number. To the bishops and presbyters the ministers or *deacons* were subject; and the latter were divided into a variety of classes, as the different exigencies of the church required. During a great part of this century, the churches were independent of each other; nor were they joined together by association, confederacy, or any other bonds but those of charity. Each assembly was a little state governed by its own laws; which were either enacted, or at least approved of, by the society. But in process of time all the Christian churches of a province were formed into one large ecclesiastical body, which, like confederate states, assembled at certain times, in order to deliberate about the common interests of the whole. This institution had its origin among the Greeks; but in a short time

it became universal, and similar assemblies were formed in all places where the gospel had been planted. These assemblies, which consisted of the deputies or commissioners from several churches, were called *synods* by the Greeks, and *councils* by the Latins; and the laws enacted in these general meetings were called *canons*, i. e. *rules*.

These councils, of which we find not the smallest trace before the middle of this century, changed the whole face of the church, and gave it a new form; for by them the ancient privileges of the people were considerably diminished, and the power and authority of the bishops greatly augmented. The humility, indeed, and prudence, of these pious prelates hindered them from assuming all at once the power with which they were afterwards invested. At their first appearance in these general councils, they acknowledged that they were no more than the delegates of their respective churches, and that they acted in the name and by the appointment of their people. But they soon changed this humble tone; imperceptibly extended the limits of their authority; turned their influence into dominion, their counsels into laws; and at length openly asserted, that Christ had empowered them to prescribe to his people *authoritative rules of faith and manners*. Another effect of these councils was the gradual abolition of that perfect equality which reigned among all bishops in the primitive times: for the order and decency of these assemblies required, that some one of the provincial bishops met in council should be invested with a superior degree of power and authority; and hence the rights of Metropolitans derive their origin. In the mean time, the bounds of the church were enlarged; the custom of holding councils was followed wherever the sound of the gospel had reached; and the universal church had now the appearance of one vast republic formed by a combination of a great number of little states. This occasioned the creation of a new order of ecclesiastics, who were appointed in different parts of the world as heads of the church, and whose office it was to preserve the consistence and union of that immense body, whose members were so widely dispersed throughout the nations. Such was the nature and office of the *Patriarchs*; among whom, at length, ambition, being arrived at its most insolent period, formed a new dignity, investing the bishop of Rome with the title and authority of the *Prince of the Patriarchs*.

During the second century, all the sects continued which had sprung up in the first, with the addition of several others; the most remarkable of which were the *Ascetics*. These owed their rise to an error propagated by some doctors of the church, who asserted that Christ had established a *double rule of sanctity and virtue* for two different orders of Christians. Of these rules, one was ordinary, the other extraordinary; the one of a lower dignity, the other more sublime: the first for persons in the active scenes of life; the other for those who, in a sacred retreat, aspired after the glory of a celestial state. In consequence of this system, they divided into two parts all those moral doctrines and instructions which they had received either by writing or tradition. One of these divisions they called *precepts*, and the other *counsels*. They gave the name of *precepts* to those laws that were universally obligato-

tory

tory upon all orders of men; and that of *counsels* to those which related to Christians of a more sublime rank, who proposed to themselves great and glorious ends, and breathed after an intimate communion with the Supreme Being.—Thus were produced all at once a new set of men, who made pretensions to uncommon sanctity and virtue, and declared their resolution of obeying all the *precepts* and *counsels* of Christ, in order to their enjoyment of communion with God here, and also that, after the dissolution of their mortal bodies, they might ascend to him with the greater facility, and find nothing to retard their approach to the centre of happiness and perfection. They looked upon themselves as prohibited from the use of things which it was lawful for other Christians to enjoy; such as wine, flesh, matrimony, and commerce. They thought it their indispensable duty to extenuate their body by watchings, abstinence, labour, and hunger. They looked for felicity in solitary retreats, and desert places; where, by severe and assiduous efforts of sublime meditation, they raised the soul above all external objects, and all sensual pleasures. They were distinguished from other Christians, not only by their title of *Ascetics*, *Σπυδαῖοι*, *Εκλεκτοί*, and philosophers, but also by their garb. In this century, indeed, those who embraced such an austere kind of life, submitted themselves to all these mortifications in private, without breaking asunder their social bands, or withdrawing themselves from mankind; but in process of time they retired into deserts, and, after the example of the *Essenes* and *Therapeutæ*, they formed themselves into certain companies.

This austere sect arose from an opinion which has been more or less prevalent in all ages and in all countries, namely, that religion consists more in prayers, meditations, and a kind of secret intercourse with God, than in fulfilling the social duties of life in acts of benevolence and humanity to mankind. Nothing can be more evident than that the Scripture reckons the fulfilling of these infinitely superior to the observance of all the ceremonies that can be imagined: yet it somehow or other happens, that almost every body is more inclined to observe the ceremonial part of devotion than the moral; and hence, according to the different humours or constitutions of different persons, there have been numberless forms of Christianity, and the most virulent contentions among those who professed themselves followers of the Prince of Peace. It is obvious, that if the moral conduct of Christians was to be made the standard of faith, instead of speculative opinions, all these divisions must cease in a moment; but while Christianity, or any part of it, is made to consist in speculation, or the observance of ceremonies, it is impossible there can be any end of sects or heresies. No opinion whatever is so absurd, but some people have pretended to argue in its defence; and no ceremony so insignificant, but it hath been explained and sanctified by hot-headed enthusiasts: and hence ceremonies, sects, and absurdities, have been multiplied without number, to the prejudice of society and of the Christian religion. This short relation of the rise of the Ascetic sect will also serve to account for the rise of any other; so that we apprehend it is needless to enter into particulars concerning the rest, as they all took their origin from the same

general principle variously modified, according to the different dispositions of mankind.

The Ascetic sect began first in Egypt, from whence it passed into Syria and the neighbouring countries. At length it reached the European nations: and hence that train of austere and superstitious vows and rites which totally obscured, or rather annihilated, Christianity; the celibacy of the clergy, and many other absurdities of the like kind. The errors of the Ascetics, however, did not stop here: In compliance with the doctrines of some Pagan philosophers, they affirmed, that it was not only lawful, but even praiseworthy, to deceive, and to use the expedient of a lie, in order to advance the cause of piety and truth; and hence the *pious frauds* for which the church of Rome hath been so notorious, and with which she hath been so often and justly reproached.

As Christians thus deviated more and more from the true practice of their religion, they became more zealous in the external profession of it. Anniversary festivals were celebrated in commemoration of the death and resurrection of Christ, and of the effusion of the Holy Ghost on the apostles. Concerning the days on which these festivals were to be kept, there arose violent contests. The Asiatic churches in general differed in this point from those of Europe; and towards the conclusion of the second century, Victor bishop of Rome took it in his head to force the eastern churches to follow the rules laid down by the western ones. This they absolutely refused to comply with: upon which Victor cut them off from communion with the church of Rome; though, by means of the intercession of some prudent people, the difference was made up for the present.

During most of the third century, the Christians were allowed to enjoy their religion, such as it was, without molestation. The emperors Maximinus and Decius, indeed, made them feel all the rigours of a severe persecution; but their reigns were short, and from the death of Decius to the time of Dioclesian the church enjoyed tranquillity. Thus vast multitudes were converted; but at the same time, the doctrine grew daily more corrupt, and the lives of professed Christians more wicked and scandalous. New ceremonies were invented in great numbers, and an unaccountable passion now prevailed for the oriental superstitions concerning demons; whence proceeded the whole train of exorcisms, spells, and fears for the apparition of evil spirits, which to this day are nowhere eradicated. Hence also the custom of avoiding all connections with those who were not baptised, or who lay under the penalty of excommunication, as persons supposed to be under the dominion of some evil spirit. And hence the rigour and severity of that discipline and penance imposed upon those who had incurred, by their immoralities, the censures of the church.—Several alterations were now made in the manner of celebrating the Lord's supper. The prayers used on this occasion were lengthened, and the solemnity and pomp with which it was attended were considerably increased. Gold and silver vessels were used in the celebration; it was thought essential to salvation, and for that reason administered even to infants.—Baptism was celebrated twice a-year to such as, after a long course of trial and preparation, offered themselves candidates.

Christianity established by Constantine.

67 Increase of its corruptions.

The remission of sins was thought to be its immediate consequence; while the bishop, by prayer and imposition of hands, was supposed to confer those sanctifying gifts of the Holy Ghost that are necessary to a life of righteousness and virtue. An evil demon was supposed naturally to reside in every person, who was the author and source of all the corrupt dispositions and unrighteous actions of that person. The driving out of this demon was therefore an essential requisite for baptism; and, in consequence of this opinion, the baptized persons returned home clothed in white garments, and adorned with crowns, as sacred emblems, the former of their inward purity and innocence, and the latter of their victory over sin and the world.—Fasting began now to be held in more esteem than formerly. A high degree of sanctity was attributed to this practice; it was even looked upon as indispensably necessary, from a notion that the demons directed their force chiefly against those who pampered themselves with delicious fare, and were less troublesome to the lean and hungry who lived under the severities of a rigorous abstinence.—The sign of the cross also was supposed to administer a victorious power over all sorts of trials and calamities; and was more especially considered as the surest defence against the snares and stratagems of malignant spirits: for which reason, no Christian undertook any thing of moment, without arming himself, as he imagined, with the power of this triumphant sign. The heresies which troubled the church during this century, were the Gnostics, (whose doctrines were new-modelled and improved by Manes, from whom they were afterwards chiefly called *Manicheans*), the Hieracites, Noetians, Sabellians, and Novatians; for a particular account of which, see those articles.

65 Fourth century.

The fourth century is remarkable for the establishment of Christianity by law in the Roman empire; which, however, did not take place till the year 324. In the beginning of the century, the empire was governed by four chiefs, viz. Dioclesian, Maximian, Constantius Chlorus, and Galerius, under whom the church enjoyed a perfect toleration. Dioclesian, tho' much addicted to superstition, had no ill-will against the Christians; and Constantius Chlorus, having abandoned polytheism, treated them with condescension and benevolence. This alarmed the Pagan priests, whose interests were so closely connected with the continuance of the ancient superstitions; and who apprehended, not without reason, that the Christian religion would at length prevail throughout the empire. To prevent the downfall of the Pagan superstition, therefore, they applied to Dioclesian and Galerius Cæsar; by whom a most bloody persecution was commenced in the year 303, and continued till 311. An asylum, however, was opened for the Christians in the year 304. Galerius having dethroned Dioclesian and Maximian, declared himself emperor in the east; leaving all the western provinces, to which great numbers of Christians resorted to avoid the cruelty of the former, to Constantius Chlorus. At length Galerius, being overtaken with an incurable and dreadful disease, published an edict ordering the persecution to cease, and restoring freedom to the Christians, whom he had most inhumanly oppressed for eight years. Galerius died the same year: and in a short time af-

ter, when Constantine the Great ascended the throne, the Christians were freed from any farther uneasiness, by his abrogating all the penal laws against them; and afterwards issuing edicts, by which no other religion than the Christian was tolerated throughout the empire.

This event, however, so favourable to the outward peace of the church, was far from promoting its internal harmony, or the reformation of its leaders. The clergy, who had all this time been augmenting their power at the expence of the liberty of the people, now set no bounds to their ambition. The bishop of Rome was the first in rank, and distinguished by a sort of pre-eminency above the rest of the prelates. He surpassed all his brethren in the magnificence and splendor of the church over which he presided, in the riches of his revenues and possessions, in the number and variety of his ministers, in his credit with the people, and in his sumptuous and splendid manner of living. Hence it happened, that when a new pontiff was to be chosen by the presbyters and people, the city of Rome was generally agitated with dissensions, tumults, and cabals, which often produced fatal consequences. The intrigues and disturbances which prevailed in that city in the year 366, when, upon the death of Liberius, another pontiff was to be chosen in his place, are a sufficient proof of what we have advanced. Upon this occasion, one faction elected Damasus to that high dignity; while the opposite party chose Ursicinus, a deacon of the vacant church, to succeed Liberius. This double election gave rise to a dangerous schism, and to a sort of civil war within the city of Rome; which was carried on with the utmost barbarity and fury, and produced the most cruel massacres and desolations. The inhuman contest ended in the victory of Damasus; but whether his cause was more just than that of Ursicinus, is not so easily determined.

Notwithstanding the pomp and splendor which surrounded the Roman see, it is certain that the bishops of Rome had not yet acquired that pre-eminence of power and jurisdiction which they afterwards enjoyed. In the ecclesiastical commonwealth, indeed, they were the most eminent order of citizens; but still they were citizens as well as their brethren, and subject, like them, to the laws and edicts of the emperors. All religious causes of extraordinary importance were examined and determined, either by judges appointed by the emperors, or in councils assembled for that purpose; while those of inferior moment were decided in each district by its respective bishop. The ecclesiastical laws were enacted either by the emperor or councils. None of the bishops acknowledged that they derived their authority from the permission and appointment of the bishop of Rome, or that they were created bishops by the favour of the *apostolic see*. On the contrary, they all maintained that they were the ambassadors and ministers of Jesus Christ, and that their authority was derived from above. It must, however, be observed, that even in this century several of those steps were laid by which the bishops of Rome mounted afterwards to the summit of ecclesiastical power and despotism. This happened partly by the imprudence of the emperors, partly by the dexterity of the Roman prelates themselves, and partly by the inconsiderate.

rate zeal and precipitate judgment of certain bishops. The imprudence of the emperor, and precipitation of the bishops, were remarkably discovered in the following event, which favoured extremely the ambition of the Roman pontiff. About the year 372, Valentinian enacted a law, empowering the bishop of Rome to examine and judge other bishops, that religious disputes might not be decided by any profane or secular judges. The bishops assembled in council at Rome in 378, not considering the fatal consequences that must arise from this imprudent law both to themselves and to the church, declared their approbation in the strongest terms, and recommended the execution of it in their address to the emperor Gratian. Some think, indeed, that this law empowered the Roman bishop to judge only the bishops within the limits of his jurisdiction; others, that his power was given only for a certain time, and for a particular purpose. This last notion seems the most probable; but still this privilege must have been an excellent instrument in the hands of sacerdotal ambition.

68
Bishops of Rome and Constantinople rival each other.

By the removal of the seat of empire to Constantinople, the emperor raised up, in the bishop of this new metropolis, a formidable opponent to the bishop of Rome, and a bulwark which threatened a vigorous opposition to his growing authority. For as the emperor, in order to render Constantinople a second Rome, enriched it with all the rights and privileges, honours and ornaments, of the ancient capital of the world; so its bishop, measuring his own dignity and rank by the magnificence of the new city, and its eminence as the residence of the emperor, assumed an equal degree of dignity with the bishop of Rome, and claimed a superiority over the rest of the episcopal order. Nor did the emperors disapprove of these high pretensions, since they considered their own dignity as connected in a certain measure with that of the bishop of their imperial city. Accordingly, in a council held at Constantinople in the year 381, by the authority of Theodosius the Great, the bishop of that city was, during the absence of the bishop of Alexandria, and against the consent of the Roman prelate, placed by the third canon of that council in the first rank after the bishop of Rome, and consequently above those of Alexandria and Antioch. Nestarius was the first bishop who enjoyed these new honours accumulated upon the see of Constantinople. His successor, the celebrated John Chrysostom, extended still farther the privileges of that see, and submitted to its jurisdiction all Thrace, Asia, and Pontus; nor were the succeeding bishops of that imperial city destitute of a fervent zeal to augment their privileges and extend their dominion. By this unexpected promotion, the most disagreeable effects were produced. The bishops of Alexandria were not only filled with the most inveterate hatred against those of Constantinople, but a contention was excited between the bishops of Rome and Constantinople; which, after being carried on for many ages, concluded at last in the separation of the Greek and Latin churches.

69
Form of church government established by Constantine.

Constantine the Great, in order to prevent civil commotions, and to fix his authority on a stable and solid foundation, made several changes not only in the laws of the empire, but also in the form of the Roman government. And as there were many important reasons

N^o 155.

which induced him to suit the administration of the church to these changes in the civil constitution, this necessarily introduced among the bishops new degrees of eminence and rank. The four bishops, of Rome, Constantinople, Antioch, and Alexandria, were distinguished by a certain degree of pre-eminence over the rest. These four prelates answered to the four prætorian prefects created by Constantine; and it is possible, that even in this century they were distinguished by the Jewish title of *patriarchs*. After these followed the *exarchs*, who had the inspection of several provinces, and answered to the appointment of certain civil officers who bore the same title. In a lower class were the *metropolitans*, who had only the government of one province; under whom were the *archbishops*, whose inspection was confined to certain districts. In this gradation the *bishops* brought up the rear; but the sphere of their authority was not in all places equally extensive; being in some considerably ample, and in others confined within narrow limits. To these various ecclesiastical orders we might add that of the *chorepiscopi*, or superintendents of the country-churches; but this last order was in most places suppressed by the bishops, with a design to extend their own authority, and enlarge the sphere of their power and jurisdiction. The administration of the church itself was divided by Constantine into an *external* and *internal* inspection. The latter, which was committed to bishops and councils, related to religious controversies, the forms of divine worship, the offices of priests, the vices of the ecclesiastical orders, &c. The external administration of the church the emperor assumed to himself. This comprehended all those things which related to the outward state and discipline of the church; it likewise extended to all contests that should arise between the ministers of the church, superior as well as inferior, concerning their possessions, their reputation, their rights and privileges, their offences against the laws, &c. but no controversies that related to matters purely spiritual were cognizable by this external inspection. In consequence of this artful division of the ecclesiastical government, Constantine and his successors called councils, presided in them, appointed the judges of religious controversies, terminated the differences which arose between the bishops and the people, fixed the limits of the ecclesiastical provinces, took cognizance of the civil causes that subsisted between the ministers of the church, and punished the crimes committed against the laws by the ordinary judges appointed for that purpose; giving over all causes purely ecclesiastical to the bishops and councils. But this famous division of the administration of the church was never explained with sufficient accuracy; so that both in the fourth and fifth centuries, there are frequent instances of the emperors determining matters purely ecclesiastical, and likewise of bishops and councils determining matters which related merely to the external form and government of the church.

After the time of Constantine many additions were made by the emperors and others to the wealth and honours of the clergy; and these additions were followed by a proportionable increase of their vices and luxury, particularly among those who lived in great and opulent cities. The bishops, on the one hand, contended with each other in the most scandalous manner

70

Scandalous lives of the clergy.

concerning the extent of their respective jurisdictions; while, on the other, they trampled on the rights of the people, violated the privileges of the inferior ministers, and imitated in their conduct and in their manner of living the arrogance, voluptuousness, and luxury of magistrates and princes. This pernicious example was soon followed by the several ecclesiastical orders. The presbyters, in many places, assumed an equality with the bishops in point of rank and authority. Many complaints are also made by the authors of this century about the vanity and effeminacy of the deacons. Those more particularly of the presbyters and deacons who filled the first stations of these orders, carried their pretensions to an extravagant length, and were offended at the notion of being placed on an equality with the colleagues. For this reason they not only assumed the titles of *arch-presbyters* and *arch-deacons*, but also claimed a degree of authority and power much superior to that which was vested in the other members of their respective orders.

71
Contests
between
the bishops
of Rome
and Con-
stantinople.

In the fifth century, the bishops of Constantinople having already reduced under their jurisdiction all the Asiatic provinces, began to grasp at still further accessions of power. By the 28th canon of the council held at Chalcedon in 451, it was resolved, that the same rights and honours which had been conferred on the bishop of Rome were due to the bishop of Constantinople, on account of the equal dignity and lustre of the two cities in which these prelates exercised their authority. The same council confirmed also, by a solemn act, the bishop of Constantinople in the spiritual government of those provinces over which he had usurped the jurisdiction. Leo the Great, bishop of Rome, opposed with vehemence the passing of these laws; and his opposition was seconded by that of several other prelates. But their efforts were vain, as the emperors threw in their weight into the balance, and thus supported the decisions of the Grecian bishops. In consequence, then, of the decisions of this famous council, the bishop of Constantinople began to contend obstinately for the supremacy with the Roman pontiff, and to crush the bishops of Antioch and Alexandria. About the same time, Juvenal, bishop of Jerusalem, attempted to withdraw himself and his church from the jurisdiction of the bishop of Cæsarea, and aspired after a place among the first prelates of the Christian world. The high degree of veneration and esteem in which the church of Jerusalem was held among all other Christian societies (on account of its rank among the apostolical churches, and its title to the appellation of *mother-church*, as having succeeded the first Christian assembly formed by the Apostles), was extremely favourable to the ambition of Juvenal, and rendered his project much more practicable than it would otherwise have been. Encouraged by this, and likewise by the protection of Theodosius the younger, this aspiring prelate not only assumed the dignity of patriarch of all Palestine, a rank which rendered him independent of all spiritual authority; but also invaded the rights of the bishop of Antioch, and usurped his jurisdiction over the provinces of Phœnicia and Arabia. Hence arose a warm contest between Juvenal and Maximus bishop of Antioch; which the council of Chalcedon decided, by restoring to the latter the provinces of Phœnicia and Arabia, and confirming the former

VOL. VIII. Part II.

in the spiritual possession of all Palestine and in the high rank which he had assumed in the church.

In 588, John, bishop of Constantinople, surnamed the *Pasler*, either by his own authority or that of the emperor Mauritius, summoned a council at Constantinople to inquire into an accusation brought against Gregory, bishop of Antioch; and upon this occasion assumed the title of *œcumenical* or *universal bishop*. This title had been formerly enjoyed by the bishops of Constantinople without any offence; but now, Gregory the Great, at that time bishop of Rome, suspecting that John was aiming at the supremacy over all the churches, opposed his claim with the greatest vigour. For this purpose he applied by letters to the emperor, and others, whom he thought capable of assisting him in his opposition: but all his efforts were without effect; and the bishops of Constantinople were allowed to enjoy the disputed title, though not in the sense which had alarmed the Roman pontiff.

Gregory, however, adhered tenaciously to his purpose, raised new tumults and dissensions among the clergy, and aimed at nothing less than an unlimited supremacy over the Christian church. This ambitious design succeeded in the west; while, in the eastern provinces, his arrogant pretensions were scarcely respected by any but those who were at enmity with the bishop of Constantinople. How much the people were at this time deluded by the Roman pontiffs, appears from the expression of Ennodius, one of the flatterers of Symmachus (who was a prelate of but ambiguous fame), that the Roman pontiff was constituted judge in the place of God, which he filled as the vicerent of the Most High. On the other hand, it is certain, from a variety of the most authentic records, that both the emperors and the nations in general were far from being disposed to bear with patience the yoke of servitude which the see of Rome was arrogantly imposing on the whole church.

In the beginning of the seventh century, according to the most learned historians, Boniface III. engaged Phocas, emperor of Constantinople, to take from the bishop of that metropolis the title of *œcumenical* or *universal bishop*, and to confer it upon the Roman pontiff; and thus was first introduced the supremacy of the pope. The Roman pontiffs used all methods to maintain and enlarge this authority and pre-eminence which they had acquired from one of the most odious tyrants that ever disgraced the annals of history.

In the eighth century, the power of the bishop of Rome, and of the clergy in general, increased prodigiously. The chief cause of this, besides the superstition of the people, was the method at that time used by the European princes to secure themselves on their thrones. All these princes being then employed either in usurpation or in self-defence, and the whole continent being in the most unsettled and barbarous condition, they endeavoured to attach warmly to their interests those whom they considered as their friends and clients. For this purpose they distributed among them extensive territories, cities, and fortresses, with the various rights and privileges belonging to them; reserving only to themselves the supreme dominion, and the military service of these powerful vassals. For this reason it was by the European princes reckoned a high instance of political prudence to distribute among the bishops

72
Origin of
the supre-
macy of the
pope.

bishops and other Christian doctors the same sort of donations which had formerly been given to their generals and clients. By means of the clergy, they hoped to check the seditious and turbulent spirits of their vassals; and to maintain them in their obedience by the influence and authority of their bishops, whose commands were highly respected, and whose spiritual thunderbolts, rendered formidable by ignorance, struck terror into the boldest and most resolute hearts.

This prodigious accession to the opulence and authority of the clergy in the west, began at their head, viz. the Roman pontiff; from whence it spread gradually among the inferior sacerdotal orders. The barbarous nations who had received the gospel, looked upon the bishop of Rome as the successor of their chief druid or high priest: and as this tremendous druid had enjoyed, under the darkness of Paganism, a kind of boundless authority; so these barbarous nations thought proper to confer upon the chief bishop the same authority which had belonged to the chief druid. The pope received these august privileges with great pleasure; and lest, upon any change of affairs, attempts should be made to deprive him of them, he strengthened his title to these extraordinary honours by a variety of passages drawn from ancient history, and, what is still more astonishing, by arguments of a religious nature. This swelled the Roman druid to an enormous size; and gave to the see of Rome that high pre-eminence and despotic authority in civil and political matters, that were unknown to former ages. Hence, among other unhappy circumstances, arose that monstrous and pernicious opinion, that such persons as were excluded from the communion of the church by the pontiff himself, or any of the bishops, forfeited thereby, not only their civil rights and advantages as citizens, but even the common claims and privileges of humanity. This horrid opinion, which was a fatal source of wars, massacres, and rebellions, without number, and which contributed more than any thing else to confirm and augment the papal authority, was borrowed by the clergy from the Pagan superstitions.—Though excommunication, from the time of Constantine the Great, was in every part of the Christian world attended with many disagreeable effects; yet its highest terrors were confined to Europe, where its aspect was truly formidable and hideous. It acquired also, in the eighth century, new accessions of terror; so that from that period the excommunication practised in Europe differed entirely from that which was in use in other parts of Christendom. Excommunicated persons were indeed considered in all places as objects of hatred both to God and man: but they were not, on that account, robbed of the privileges of citizens, nor of the rights of humanity; much less were those kings and princes, whom an insolent bishop had thought proper to exclude from the communion of the church, supposed to forfeit on that account their crowns or their territories. But from this century it was quite otherwise in Europe. Excommunication received that infernal power which dissolved all connections; so that those whom the bishops, or their chief, excluded from church communion, were degraded to a level with the beasts. The origin of this unnatural and horrid power was as follows. On the conversion of the barbarous nations to Christian-

ity, these ignorant proselytes confounded the excommunication in use among Christians with that which had been practised in the times of Paganism, and which was attended with all the dreadful effects above mentioned. The Roman pontiffs, on the other hand, were too artful not to encourage this error; and therefore employed all sorts of means to gain credit to an opinion so well calculated to gratify their ambition, and to aggrandize in general the episcopal order.

The annals of the French nation furnish us with the following instance of the enormous power which was at this time vested in the Roman pontiff. Pepin, who was mayor of the palace to Childeric III. king of France, and who in the exercise of that high office was possessed in reality of the royal power and authority, aspired to the titles and honours of majesty also, and formed a scheme of dethroning his sovereign. For this purpose he assembled the states in 751; and though they were devoted to the interests of this ambitious usurper, they gave it as their opinion that the bishop of Rome was previously to be consulted whether the execution of such a scheme was lawful or not. In consequence of this, ambassadors were sent by Pepin to Zachary, the reigning pontiff, with the following question, "Whether the divine law did not permit a valiant and warlike people to dethrone a pusillanimous and indolent prince who was incapable of discharging any of the functions of royalty; and to substitute in his place one more worthy to rule, and who had already rendered most important services to the state?" The situation of Zachary, who stood much in need of the succours of Pepin against the Greeks and Lombards, rendered his answer such as the usurper desired: and when this favourable decision of the Roman oracle was published in France, the unhappy Childeric was stripped of his royalty without the least opposition; and Pepin, without the smallest resistance, stepped into the throne of his master and his sovereign. This decision was solemnly confirmed by Stephen II. the successor of Zachary; who undertook a journey into France in the year 754, in order to solicit assistance against the Lombards. The pontiff at the same time dissolved the obligation of the oath of fidelity and allegiance which Pepin had sworn to Childeric, and violated by his usurpation in the year 751; and to render his title to the crown as sacred as possible, Stephen anointed and crowned him, with his wife and two sons, for the second time. This complaisance of the pope was rewarded with the exarchate of Ravenna and all its dependencies, as we have already related. See *Civil History*, n° 44. *supra*; and *History of ITALY*.

In the succeeding centuries, the Roman pontiffs continued to increase their power by every kind of artifice and fraud which can dishonour the heart of man; and, by continually taking advantage of the civil dissensions which prevailed throughout Italy, France, and Germany, their influence in civil affairs arose to an enormous height. The increase of their authority in religious matters was not less rapid. The wisest and most impartial among the Roman Catholic writers acknowledge, that from the time of Louis the Meek the ancient rules of ecclesiastical government were gradually changed in Europe by the counsels and instigation of the

73
He becomes a temporal prince.

74
His power still increases.

the church of Rome, and new laws substituted in their place. The European princes suffered themselves to be divested of the supreme authority in religious matters, which they had derived from Charlemagne; the power of the bishops was greatly diminished, and even the authority of both provincial and general councils began to decline. The popes, elated with their overgrown prosperity, and become arrogant beyond measure by the daily accessions that were made to their authority, were eagerly bent upon establishing the maxim, That the bishop of Rome was constituted and appointed by Jesus Christ supreme legislator and judge of the church universal; and that therefore the bishops derived all their authority from him. This opinion, which they inculcated with the utmost zeal and ardour, was opposed in vain by such as were acquainted with the ancient ecclesiastical constitutions, and the government of the church in the earlier ages. In order to gain credit to this new ecclesiastical code, and to support the pretensions of the popes to supremacy, it was necessary to produce the authority of ancient deeds, in order to stop the mouths of such as were disposed to set bounds to their usurpations. The bishops of Rome were aware of this; and as those means were looked upon as the most lawful that tended best to the accomplishment of their purposes, they employed some of their most ingenious and zealous partisans in forging conventions, acts of councils, epistles, and such-like records, by which it might appear, that in the first ages of the church the Roman pontiffs were clothed with the same spiritual majesty and supreme authority which they now assumed. There were not, however, wanting among the bishops some men of prudence and sagacity, who saw through these impious frauds, and perceived the chains that were forging both for them and the church. The French bishops distinguished themselves eminently in this respect: but their opposition was soon quashed; and as all Europe was sunk in the grossest ignorance and darkness, none remained who were capable of detecting these odious impostures, or disposed to support the expiring liberty of the church.

75
Extreme
insolence
of the
popes.

This may serve as a general specimen of the character and behaviour of the pretended vicegerents of Jesus Christ to the 16th century. In the 11th century, indeed, their power seems to have risen to its utmost height. They now received the pompous titles of *Masters of the World*, and *Popes*, i. e. *universal fathers*. They presided every where in the councils by their legates, assumed the authority of supreme arbiters in all controversies that arose concerning religion or church-discipline, and maintained the pretended rights of the church against the encroachments and usurpations of kings and princes. Their authority, however, was confined within certain limits: for, on the one hand, it was restrained by sovereign princes, that it might not arrogantly aim at civil dominion; and, on the other, it was opposed by the bishops themselves, that it might not arise to a spiritual despotism, and utterly destroy the privileges and liberty of synods and councils. From the time of Leo IX. the popes employed every method which the most artful ambition could suggest to remove those limits, and to render their dominion both despotic and universal. They not only aspired to the character of supreme legislators in the church, to an unlimited jurisdiction over all synods and councils whe-

ther general or provincial, to the sole distribution of all ecclesiastical honours and benefices, as divinely authorised and appointed for that purpose; but they carried their insolent pretensions so far, as to give themselves out for lords of the universe, arbiters of the fate of kingdoms and empires, and supreme rulers over the kings and princes of the earth. Hence we find instances of their giving away kingdoms, and loosing subjects from their allegiance to their sovereigns; among which the history of John king of England is very remarkable. At last they plainly assumed the whole earth as their property, as well where Christianity was preached as where it was not; and therefore, on the discovery of America and the East Indies, the pope, by virtue of this spiritual property, granted to the Portuguese a right to all the countries lying eastward, and to the Spaniards all those lying to the westward, of Cape Non in Africa which they were able to conquer by force of arms; and that nothing might be wanting to complete their character, they pretended to be lords of the future world also, and to have a power of restraining even the divine justice itself, and remitting that punishment which the Deity hath denounced against the workers of iniquity.

All this time the powers of superstition reigned triumphant over those remains of Christianity which had escaped the corruptions of the first four centuries. In the fifth century began the invocation of the happy souls of departed saints. Their assistance was invoked by many fervent prayers, while none stood up to oppose this preposterous kind of worship. The images of those who during their lives had acquired the reputation of uncommon sanctity, were now honoured with a particular worship in several places; and many imagined that this drew into the images the propitious presence of the saints or celestial beings which they were supposed to represent. A singular and irresistible efficacy was attributed to the bones of martyrs, and to the figure of the cross, in defeating all the attempts of Satan, removing all sorts of calamities, and in healing not only the diseases of the body, but also those of the mind. The famous Pagan doctrine concerning the *purification of departed souls* by means of a certain kind of fire, i. e. purgatory, was also confirmed and explained more fully than it had formerly been; and every one knows of how much consequence this absurd doctrine hath been to the wealth and power of the Romish clergy.

In the sixth century, Gregory the Great advanced an opinion, That all the *words* of the sacred writings were *images* of invisible and spiritual things; for which reason he loaded the churches with a multitude of ceremonies the most insignificant and futile that can be imagined; and hence arose a new and most difficult science, namely, the explication of these ceremonies, and the investigation of the causes and circumstances whence they derived their origin. A new method was contrived of administering the Lord's supper, with a magnificent assemblage of pompous ceremonies. This was called the *canon of the mass*. Baptism, except in cases of necessity, was administered only on the great festivals. An incredible number of temples were erected in honour of the saints. The places set apart for public worship were also very numerous; but now they were considered as the means of purchasing the protec-

tion of the
mass.

tion and favour of the saints; and the ignorant and barbarous multitude were persuaded, that these departed spirits defended and guarded against evils and calamities of every kind, the provinces, lands, cities, and villages in which they were honoured with temples. The number of these temples was almost equalled by that of the festivals, which seem to have been invented in order to bring the Christian religion as near the model of Paganism as possible.

In the seventh century, religion seemed to be altogether buried under a heap of superstitious ceremonies; the worship of the true God and Saviour of the world was exchanged for the worship of bones, bits of wood (said to be of the cross), and the images of saints. The eternal state of misery threatened in Scripture to the wicked was exchanged for the temporary punishment of purgatory; and the expressions of faith in Christ by an upright and virtuous conduct, for the augmentation of the riches of the clergy by donations to the church, and the observance of a heap of idle ceremonies. New festivals were still added; one in particular was instituted in honour of the *true cross* on which our Saviour suffered: and churches were declared to be sanctuaries to all such as fled to them, whatever their crimes might have been.

Superstition, it would seem, had now attained its highest pitch; nor is it easy to conceive a degree of ignorance and degeneracy beyond what we have already mentioned. If any thing can possibly be imagined more contrary to true religion, it is an opinion which prevailed in the eighth century, namely, That Christians might appease an offended Deity by voluntary acts of mortification, or by gifts and oblations lavished on the church; and that people ought to place their confidence in the works and merits of the saints. The piety in this and some succeeding ages consisted in building and embellishing churches and chapels; in endowing monasteries and basilics; hunting after the relics of saints and martyrs, and treating them with an absurd and excessive veneration; in procuring the intercession of the saints by rich oblations, or superstitious rites; in worshipping images; in pilgrimages to those places which were esteemed holy, particularly to Palestine, &c. The genuine religion of Jesus was now utterly unknown both to clergy and people, if we except a few of its general doctrines contained in the creed. In this century also, the superstitious custom of *solitary masses* had its origin. These were celebrated by the priest alone in behalf of souls detained in purgatory, as well as upon some other occasions. They were prohibited by the laws of the church, but proved a source of immense wealth to the clergy. Under Charlemagne they were condemned by a synod assembled at Mentz, as criminal effects of avarice and sloth. A new superstition, however, still sprung up in the tenth century. It was imagined, from Rev. xx. 1 that Antichrist was to make his appearance on the earth, and that soon after the world itself would be destroyed. An universal panic ensued; vast numbers of people, abandoning all their connections in society, and giving over to the churches and monasteries all their worldly effects, repaired to Palestine, where they imagined that Christ would descend from heaven to judge the world. Others devoted themselves by a solemn and voluntary oath to the service of the churches,

convents, and priesthood, whose slaves they became, in the most rigorous sense of that word, performing daily their heavy tasks; and all this from a notion that the supreme judge would diminish the severity of their sentence, and look upon them with a more favourable and propitious eye, on account of their having made themselves the slaves of his ministers. When the eclipse of the sun or moon happened to be visible, the cities were deserted, and their miserable inhabitants fled for refuge to hollow caverns, and hid themselves among the craggy rocks, and under the bending summits of steep mountains. The opulent attempted to bribe the saints and the Deity himself by rich donations conferred upon the sacerdotal tribe, who were looked upon as the immediate vicegerents of heaven. In many places, temples, palaces, and noble edifices both public and private, were suffered to decay, nay, were deliberately pulled down, from a notion that they were no longer of any use, as the final dissolution of all things was at hand. In a word, no language is sufficient to express the confusion and despair that tormented the minds of miserable mortals upon this occasion. The general delusion was indeed opposed and combated by the discerning few, who endeavoured to dispel these terrors, and to efface the notion from which they arose in the minds of the people. But their attempts were ineffectual; nor could the dreadful apprehensions of the superstitious multitude be removed before the end of the century, and this terror became one of the accidental causes of the *CROISADES*.

That nothing might now be wanting to complete that antichristian system of religion which had overspread all Europe, it was in the 11th century determined that divine worship should be celebrated in the Latin tongue, though now unknown throughout the whole continent. During the whole of this century, also, Christians were employed in the rebuilding and ornamenting their churches, which they had destroyed through the superstitious fear already taken notice of.

In much the same way with what is above related, or worse if possible, matters went on till the time of the reformation. The clergy were immersed in crimes of the deepest dye; and the laity, imagining themselves able to purchase pardon of their sins for money, followed the examples of their pastors without remorse. The absurd principle formerly mentioned, namely, that religion consists in acts of austerity, and an unknown mental correspondence with God, produced the most extravagant and ridiculous behaviour in the devotees and reputed saints. They not only lived among the wild beasts, but also after the manner of these savage animals: they ran naked through the lonely deserts with a furious aspect, and all the agitations of madness and frenzy; they prolonged their wretched life by grass and wild herbs, avoided the sight and conversation of men, remained almost motionless in certain places for several years exposed to the rigour and inclemency of the seasons, and towards the conclusion of their lives shut themselves up in narrow and miserable huts; and all this was considered as true piety, the only acceptable method of worshipping the Deity and attaining a share in his favour.—But of all the instances of superstitious frenzy which disgraced the times we now speak of, none was held in higher veneration, or excited more the wonder of the multitude,

tude, than that of a certain order of men who were called *Stilites* by the Greeks, and *Sancti Columnares*, or Pillar Saints, by the Latins. These were persons of a most singular and extravagant turn of mind, who stood motionless on the tops of *pillars* expressly raised for this exercise of their patience, and remained there for several years amidst the admiration and applause of the stupid populace. The inventor of this strange discipline was one *Simeon* a Syrian, who began his follies by changing the agreeable employment of a shepherd for the austerities of a monkish life. He began his devotion on the top of a pillar six cubits high; but as he increased in sanctity, he also increased the height of his pillar, till, towards the conclusion of his life, he had got up on the top of a pillar 40 cubits in height. Many of the inhabitants of Syria and Palestine, seduced by a false ambition and an utter ignorance of true religion, followed the example of this fanatic, though not with the same degree of austerity. This superstitious practice began in the fifth century, and continued in the east for 600 years. The Latins, however, had too much wisdom and prudence to imitate the Syrians and Orientals in this whimsical superstition; and when a certain fanatic, or impostor, named *Wulfilaicus*, erected one of these pillars in the country of Treves, and proposed to live on it after the manner of *Simeon*, the neighbouring bishops ordered it to be pulled down.

The practices of austere worship and discipline in other respects, however, gained ground throughout all parts of Christendom. Monks of various kinds were to be found in every country in prodigious numbers. But though their discipline was at first exceedingly severe, it became gradually relaxed, and the monks gave into all the prevailing vices of the times. Other orders succeeded, who pretended to still greater degrees of sanctity, and to reform the abuses of the preceding ones; but these in their turn became corrupted, and fell into the same vices they had blamed in others. The most violent animosities, disputes, and hatred, also reigned among the different orders of monks; and, indeed, between the clergy of all ranks and degrees, whether we consider them as classed in different bodies, or as individuals of the same body. To enter into a detail of their wranglings and disputes, the methods which each of them took to aggrandise themselves at the expence of their neighbours, and to keep the rest of mankind in subjection, would require many volumes. We shall only observe, therefore, that even the external profession of the austere and absurd piety which took place in the fourth and fifth centuries, continued gradually to decline. Some there were, indeed, who boldly opposed the torrent of superstition and wickedness which threatened to overflow the whole world: but their opposition proved fruitless, and all of these towards the era of the reformation had been either silenced or destroyed: so that, at that time, the pope and clergy reigned over mankind without controul, had made themselves masters of almost all the wealth in every country of Europe, and may truly be said to have been the only *sovereigns*; the rest of the human race, even kings and princes, being only their vassals and slaves.

While the Popish superstition reigned thus violently in the west, the absurd doctrines of Mahomet over-

spread all the east. The rise of this impostor is related under the article ARABIA. His successors conquered in order to establish the religion of their apostle; and thus the very name of Christianity was extinguished in many places where it had formerly flourished. The conquests of the Tartars having intermingled them with the Mahometans, they greedily embraced the superstitions of that religion, which thus almost entirely overspread the whole continents of Asia and Africa; and, by the conquest of Constantinople by the Turks in 1453, was likewise established throughout a considerable part of Europe.

About the beginning of the 16th century, the Roman pontiffs lived in the utmost tranquillity; nor had they, according to the appearance of things at that time, any reason to fear an opposition to their authority in any respect, since the commotions which had been raised by the Waldenses, Albigenes, &c. were now entirely suppressed. We must not, however, conclude, from this apparent tranquillity and security of the pontiffs and their adherents, that their measures were universally applauded. Not only private persons, but also the most powerful princes and sovereign states, exclaimed loudly against the tyranny of the popes, and the unbridled licentiousness of the clergy of all denominations. They demanded, therefore, a reformation of the church in its head and members, and a general council to accomplish that necessary purpose. But these complaints and demands were not carried to such a length as to produce any good effect; since they came from persons who never entertained the least doubt about the supreme authority of the pope in religious matters, and who of consequence, instead of attempting themselves to bring about that reformation which was so ardently desired, remained entirely inactive, or looked for redress to the court of Rome, or to a general council. But while the so much desired reformation seemed to be at such a great distance, it suddenly arose from a quarter whence it was not at all expected. A single person, Martin Luther, a monk of the order of St Augustine, ventured to oppose himself to the whole torrent of papal power and despotism. This bold attempt was first made public on the 30th of September 1517; and, notwithstanding all the efforts of the pope and his adherents, the doctrines of Luther continued daily to gain ground. Others, encouraged by his success, lent their assistance in the work of reformation; which at last produced new churches, founded upon principles quite different from that of Rome, and which still continue. But for a particular account of the transactions of the first reformers, the opposition they met with, and the final settlement of the reformed churches in different nations in Europe, see the articles LUTHER and REFORMATION.

The state of religion in other parts of the world seems as yet to be but little altered. Asia and Africa are sunk in the grossest superstitions either of the Mahomedan or Pagan kinds. The southern continent of America, belonging to the Spaniards, continues immersed in the most absurd superstitions of Popery. The northern continent, being mostly peopled with colonies from Great Britain, professes the reformed religion. At the same time it must be owned, that some kind of reformation hath taken place even in Popery and Mahomedanism themselves. The popes have no longer

81
State of religion in the beginning of the 16th century and since that time.

Composi-
tion of
History.

longer that authority over states and princes, even those most bigoted to Popery, which they formerly had. Neither are the lives either of the clergy or laity so corrupt as they were before. The increase of learning in all parts of the world has contributed to cause men open their eyes to the light of reason, and this hath been attended with a proportional decrease of superstition. Even in Mahomedan countries, that furious enthusiasm which formerly emboldened the inhabitants to face the greatest dangers, hath now almost vanished; so that the credit of Mahomet himself seems to have sunk much in the estimation of his followers. This is to be understood even of the most ignorant and bigoted multitude; and the sensible part of the Turks are said to incline much towards deism. With regard to those nations which still profess Paganism, the intercourse of Europeans with them is so small, that it is impossible to say any thing concerning them. As none of them are in a state of civilization, however, it may be conjectured, that their religion is of the same unpolished cast with their manners; and that it consists of a heap of barbarous superstitions which have been handed down among them from time immemorial, and which they continue to observe without knowing why or wherefore.

SECT. III. *Of the Composition of History.*

CICERO has given us the whole art of composing history, in a very short and comprehensive manner. We shall first transcribe what he says, and then consider the several parts of it in their proper order. "No one is ignorant (says he), that the first law in writing history is, Not to dare to say any thing that is false; and the next, Not to be afraid to speak the truth: that on the one hand there be no suspicion of affection, nor of prejudice on the other. These foundations are what all are acquainted with. But the superstructure consists partly in things, and partly in the style or language. The former require an order of times, and descriptions of places. And because in great and memorable events, we are desirous to know first their causes, then the actions themselves, and lastly their consequences; the historian should take notice of the springs or motives that occasioned them; and, in mentioning the facts themselves, should not only relate what was done or said, but likewise in what manner; and, in treating upon their consequences, shew if they were the effects of chance, wisdom, or imprudence. Nor should he only recite the actions of great and eminent persons, but likewise describe their characters. The style ought to be fluent, smooth, and even, free from that harshness and pugnancy which is usual at the bar." Thus far Cicero. An history written in this manner, and furnished with all these properties, must needs be very entertaining, as well as instructive. And perhaps few have come nearer this plan than Tacitus; though his subject is attended with this unhappy circumstance, or at least unpleasant one, that it affords us examples rather of what we ought to avoid than what to imitate. But it is the business of the historian, as well as of the philosopher, to represent both virtues and vices in their proper colours; the latter doing it by precepts, and the former by examples. Their manner is different; but the end and design of both is, or should

be, the same: And therefore history has not improperly been said by some to be moral philosophy exemplified in the lives and actions of mankind.

We shall reduce these several things mentioned by Cicero to three heads, Matter, Order, and Style; and treat upon each of them separately. But as Truth is the basis and foundation of all history, it will be necessary to consider that in the first place.

ART. I. *Of Truth in History.*

TRUTH is, as it were, the very life and soul of history, by which it is distinguished from fable or romance. An historian therefore ought not only to be a man of probity, but void of all passion or bias. He must have the steadiness of a philosopher, joined with the vivacity of a poet or orator. Without the former, he will be insensibly swayed by some passion to give a false colouring to the actions or characters he describes, as favour or dislike to parties or persons affect his mind. Whereas he ought to be of no party, nor to have either friend or foe while writing; but to preserve himself in a state of the greatest indifferency to all, that he may judge of things as they really are in their own nature, and not as connected with this or that person or party. And with this firm and sedate temper, a lively imagination is requisite; without which his descriptions will be flat and cold, nor will he be able to convey to his readers a just and adequate idea of great and generous actions. Nor is the assistance of a good judgment less necessary than any of the former qualities, to direct him what is proper to be said and what to be omitted, and to treat every thing in a manner suitable to its importance. And since these are the qualifications necessary for an historian, it may perhaps seem the less strange that we have so few good histories.

But historical truth consists of two parts; one is, Not to say any thing we know to be false: Though it is not sufficient to excuse an historian in relating a falsehood that he did not know it was so when he wrote it, unless he first used all the means in his power to inform himself of the truth; for then, undoubtedly, an invincible error is as unpardonable in history as in morality. But the generality of writers in this kind content themselves with taking their accounts from hearsays, or transcribing them from others; without duly weighing the evidence on which they are founded, or giving themselves the trouble of a strict inquiry. Few will use the diligence necessary to inform themselves of the certainty of what they undertake to relate. And as the want of this greatly abates the pleasure of reading such writers, while persons read with diffidence; so nothing more recommends an historian than such industry. Thus we are informed of Thucydides, that when he wrote his history of the Peloponnesian war, he did not satisfy himself with the best accounts he could get from his countrymen the Athenians, fearing they might be partial in their own cause; but spared no expence to inform himself how the same facts were related by their enemies the Lacedaemonians; that, by comparing the relations of both parties, he might better judge of the truth. And Polybius took greater pains than he, in order to write his history of the Roman affairs; for he travelled into Africa, Spain, Gaul, and other parts of the world, that

that by viewing the several scenes of action, and informing himself from the inhabitants, he might come at a greater certainty of the facts, and represent them in a juster light. But as an historian ought not to assert what he knows to be false; so he should likewise be cautious in relating things which are doubtful, and acquaint his readers with the evidence he goes upon in such facts, from whence they may be able to judge how far it is proper to credit them. So Herodotus tells us what things he saw himself in his travels, and what he heard from the information of the Egyptian priests and others with whom he conversed. And Curtius, in the life of Alexander, speaking of the affairs of India, ingenuously confesses, that he wrote more than he fully believed. "For (says he) I neither dare to affirm positively what I doubt of, nor can I think it proper to omit what I have been told." By such a conduct the author secures his credit, whether the things prove really true or false; and gives room for further inquiry, without imposing on his readers.

The other branch of historical truth is, Not to omit any thing that is true, and necessary to set the matter treated of in a clear and full light. In the actions of past ages or distant countries, wherein the writer has no personal concern, he can have no great inducement to break in upon this rule. But where interest or party is engaged, it requires no small candour, as well as firmness of mind, constantly to adhere to it. Affection to some, aversion too thers, fear of disobliging friends or those in power, will often interpose and try his integrity. Besides, an omission is less obvious to censure, than a false assertion: for the one may be easily ascribed to ignorance or forgetfulness; whereas the other will, if discovered, be commonly looked upon as design. He therefore, who in such circumstances, from a generous love to truth, is superior to all motives to betray or stifle it, justly deserves the character of a brave as well as honest man. What Polybius says upon this head is very well worth remarking: "A good man ought to love his friends and his country, and to have a like disposition with them, both towards their friends and enemies. But when he takes upon him the character of an historian, they must all be forgot. He must often speak well of his enemies, and commend them when their actions deserve it; and sometimes blame, and even upbraid his greatest friends, when their conduct makes it necessary. Nor must he forbear sometimes to reprove, and at other times to commend, the same persons; since all are liable to mistake in their management, and there are scarce any persons who are always in the wrong. Therefore, in history, all personal considerations should be laid aside, and regard had only to their actions."

What a different view of mankind and their actions should we have were these rules observed by all historians? Integrity is undoubtedly the principal qualification of an historian; when we can depend upon this, other imperfections are more easily passed over. Suetonius is said to have written the lives of the first twelve Roman emperors with the same freedom wherewith they themselves lived. What better character can be given of a writer? The same ingenuous temper appears in the two Grecian historians above mentioned, Thucydides and Polybius: The former of whom, though banished by his countrymen the Athe-

nians, yet expresses no marks of resentment in his history, either against them in general, or even against the chief authors of it, when he has occasion to mention them; and the latter does not forbear censuring what he thought blameable in his nearest relations and friends. But it is often no easy matter to know whether an historian speaks truth or not, and keeps up to the several characters here mentioned; tho' it seems reasonable, upon the common principles of justice due to all mankind, to credit him where no marks of partiality or prejudice appear in his writings. Sometimes, indeed, a judgment may in a good measure be formed of the veracity of an author from his manner of expressing himself. A certain candour and frankness, that is always uniform and consistent with itself, runs through their writings who have nothing in view but truth, which may be justly esteemed as a very good evidence of their sincerity. Whereas those who have partial designs to answer are commonly more close and covert; and if at other times they assume an air of openness and freedom, yet this is not constant and even, but soon followed again with the appearance of some bias and reserve: for it is very difficult to act a part long together without lying open to a discovery. And therefore, though craft and design is exceeding various, and, Proteus-like, assumes very different shapes, there are certain characters by which it may often be perceived and detected. Thus, where things are uncertain by reason of their being reported various ways, it is partiality in an historian to give into the most unfavourable account, where others are as well known and equally credible. Again, it is a proof of the same bad temper, when the facts themselves are certain and evident, but the design and motives of those concerned in them are unknown and obscure, to assign some ill principle, such as avarice, ambition, malice, interest, or any other vicious habit, as the cause of them. This conduct is not only unjust to the persons whose actions they relate; but hurtful to mankind in general, by endeavouring to destroy the principal motive to virtue, which springs from example. Others, who affect to be more covert, content themselves with suspicious and fly insinuations; and then endeavour to come off, by intimating their unwillingness to believe them, tho' they would have their readers do so. And to mention no more, there are others, who, when they have loaded persons with unjust calumnies and reflections, will allow them some slight commendations, to make what they have said before look more credible, and themselves less partial. But the honest and faithful historian contemns all such low and mean arts; he considers things as they are in themselves, and relates them as he finds them, without prejudice or affection.

ART. II. The SUBJECT or ARGUMENT of History.

THE *subject* in general is facts, together with such things as are either connected with them, or may at least be requisite to set them in a just and proper light. But although the principal design of history be to acquaint us with facts, yet all facts do not merit the regard of an historian; but such only as may be thought of use and service for the conduct of human life. Nor is it allowable for him, like the poet, to form the plan and scheme of his work as he pleases. His business

84
Subject of
history.

Composi-
tion of
History.

is to report things as he finds them, without any colouring or disguise to make them more pleasing and palatable to his reader, which would be to convert his history into a novel. Indeed, some histories afford more pleasure and entertainment than others, from the nature of the things of which they consist; and it may be esteemed the happiness of an historian to meet with such a subject, but it is not his fault if it be otherwise. Thus Herodotus begins his history with showing, that the barbarians gave the first occasion to the wars between them and the Greeks, and ends it with an account of the punishment which, after some ages, they suffered from the Greeks on that account. Such a relation must not only be very agreeable to his countrymen the Grecians, for whose sakes it was written; but likewise very instructive, by informing them of the justice of Providence in punishing public injuries in this world, wherein societies, as such, are only capable of punishment. And therefore those examples might be of use to caution them against the like practices. On the contrary, Thucydides begins his history with the unhappy state of his countrymen the Athenians; and in the course of it plainly intimates, that they were the cause of the calamitous war between them and the Lacedemonians. Whereas, had he been more inclined to please and gratify his countrymen than to write the truth, he might have set things in such a light as to have made their enemies appear the aggressors. But he scorned to court applause at the expence of truth and justice, and has set a noble example of integrity to all future historians. But as all actions do not merit a place in history, it requires no small judgement in an historian to select such only as are proper. Cicero observes very justly, that history "is conversant in great and memorable actions." For this reason, an historian should always keep posterity in view; and relate nothing which may not, upon some account or other, be worth the notice of after-ages. To descend to trivial and minute matters, such as frequently occur in the common affairs of life, is below the dignity of history. Such writers ought rather to be deemed journalists than historians, who have no view or expectation that their works should survive them. But the skilful historian is fired with a more noble ambition. His design is to acquaint succeeding ages with what remarkable occurrences happened in the world before them; to do justice to the memory of great and virtuous men; and at the same time to perpetuate his own. Pliny the younger has some fine reflections upon this head, in a letter to a friend. "You advise me (says he) to write an history; and not you only, for many others have done the same, and I am myself inclined to it. Not that I believe myself qualified for it, which would be rash to think till I have tried it; but because I esteem it a generous action not to suffer those to be forgotten, whose memory ought to be eternized; and to perpetuate the names of others, together with one's own. For there is nothing I am so desirous or ambitious of, as to be remembered hereafter; which is a thing worthy of a man, especially of one who, conscious of no guilt, has nothing to fear from posterity. Therefore I am thinking day and night by what means, as Virgil says,

—My name

To raise aloft:

Nº 155.

That would suffice me; for it is above my wish to add with him,

—and wing my flight to fame.

But oh!

However, this is enough, and what history alone seems to promise." This was Pliny's opinion with regard to the use and advantage of history; the subjects of which are generally matters of weight and importance. And therefore, when a prudent historian thinks it convenient to take notice of things in themselves less considerable, he either does it with brevity, or for some apparent reason, or accounts for it by some just apology. So Dion Cassius, when he has mentioned some things of less moment in the life of Commodus (as indeed that emperor's life was chiefly filled up with cruelty and folly), makes this excuse for himself: "I would not have it thought that I descend below the gravity of history in writing these things: For, as they were the actions of an emperor, and I was present and saw them all, and both heard and conversed with him, I did not think it proper to omit them." He seems to think those actions, when performed by an emperor, might be worth recording, which, if done by a person of inferior rank, would scarce have deserved notice. Nor does he appear to have judged amiss, if we consider what an influence the conduct and behaviour of princes, even in the common circumstances of life, have upon all beneath them; which may sometimes render them not unworthy the regard of an historian, as examples either for imitation or caution.

But although facts in general are the proper subject of history, yet they may be differently considered with regard to the extent of them, as they relate either to particular persons or communities of men. And from this consideration history has been distinguished into three sorts, viz. *biography*, *particular* and *general history*. The lives of single persons is called *biography*. By *particular history* is meant that of particular states, whether for a shorter or longer space of time. And *general history* contains an account of several states existing together in the same period of time.

1. The subjects of *biography* are the lives either of public or private persons; for many useful observations in the conduct of human life may be made from just accounts of those who have been eminent and beneficial to the world in either station. Nay, the lives of vicious persons are not without their use, as warnings to others, by observing the fatal consequences which sooner or later generally follow such practices. But, for those who exposed their lives, or otherwise employed their time and labour, for the service of their fellow-creatures, it seems but a just debt that their memories should be perpetuated after them, and posterity acquainted with their benefactors. The expectation of this was no small incentive to virtue in the Pagan world. And perhaps every one, upon due reflection, will be convinced how natural this passion is to mankind in general. And it was for this reason, probably, that Virgil places not only his heroes, but also the inventors of useful arts and sciences, and other persons of distinguished merit, in the Elysian Fields, where he thus describes them:

Here patriots live, who, for their country's good,
In fighting fields were prod'gal of blood:

Priests

Priests

Composition of History.

Priests of unblemish'd lives here make abode,
And poets worthy their inspiring god;
And searching wits of more mechanic parts,
Who grac'd their age with new invented arts;
Those who to worth their bounty did extend,
And those who knew that bounty to commend:
The heads of these with holy fillets bound,
And all their temples were with garland's crown'd.
ÆNEID, l. vi. v. 66.

In the lives of public persons, their public characters are principally, but not solely, to be regarded. The world is inquisitive to know the conduct of princes and other great men, as well in private as public. And both, as has been said, may be of service, considering the influence of their examples. But to be over-inquisitive in searching into the weaknesses and infirmities of the greatest or best of men, is, to say no more of it, but a needless curiosity. In the writers of this kind, Plutarch is justly allowed to excel.

But it has been a matter of dispute among the learned, whether any one ought to write his own history. It may be pleaded in favour of this, that no one can be so much master of the subject as the person himself: and besides, there are many instances, both ancient and modern, to justify such a conduct. But on the other hand it must be owned, that there are many inconveniencies which attend it; some of which are mentioned by Cicero. "If (says he) there is any thing commendable, persons are obliged to speak of themselves with greater modesty, and to omit what is blameable in others. Besides, what is said is not so soon credited, and has less authority; and after all, many will not stick to censure it." And Pliny says very well to the same purpose, "Those who proclaim their own virtues, are thought not so much to proclaim them because they did them, as to have done them that they might proclaim them. So that which would have appeared great if told by another, is lost when related by the party himself. For when men cannot deny the fact, they reflect upon the vanity of its author. Wherefore, if you do things not worth mentioning, the actions themselves are blamed; and if the things you do are commendable, you are blamed for mentioning them." These reflections will be generally allowed to be very just; and yet considering how natural it is for men to love themselves, and to be inclined in their own favour, it seems to be a very difficult task for any one to write an impartial history of his own actions. There is scarce any treatise of this kind that is more celebrated than Cæsar's Commentaries. And yet Suetonius tells us, that "Asinius Pollio (who lived at that time) thought they were neither written with due care nor integrity: that Cæsar was often too credulous in his accounts of what was done by other persons; and misrepresented his own actions, either designedly, or through forgetfulness: and therefore he supposes he would have revised and corrected them." However, at some times it may doubtless be justifiable for a person to be his own historian. Plutarch mentions two cases wherein it is allowable for a man to commend himself, and be the publisher of his own merits. These are, when the doing of it may be of considerable advantage either to himself or others. It is indeed less invidious for other persons to undertake the province. And

VOL. VIII. Part II.

especially for a person to talk or write of his own virtues, at a time when vice and a general corruption of manners prevails, let what he says be ever so true, it will be apt at least to be taken as a reflection upon others. "Anciently (says Tacitus), many wrote their own lives, rather as a testimony of their conduct, than from pride." Upon which he makes this judicious remark: "That the more virtue abounds, the sooner the reports of it are credited." But the ancient writers had a way of taking off the reader's attention from themselves in recording their own actions, and so rendering what they said less invidious: and that was, by speaking of themselves in the third person, and not in the first. Thus Cæsar never says, "I did," or, "I said, this or that;" but always, "Cæsar did, or said, so and so." Why the moderns have not more chosen to follow them in this, we know not, since it seems less exceptionable.

2. In a continued history of *particular* states, some account may be given of their original, and founders; the nature of their soil, and situation; what advantages they have for their support or improvement, either within themselves, by foreign traffic, or conquests; with the form of their government. Then notice should be taken of the methods by which they increased in wealth or power, till they gradually advanced to their highest pitch of grandeur; whether by their virtue, the goodness of their constitution, trade, industry, wars, or whatever cause. After this the reasons of their declensions should be shown; what were the vices that principally occasioned it (for that is generally the case); whether avarice, ambition, luxury, discord, cruelty, or several of these in conjunction. And lastly, where that has been their unhappy fate, how they received their final ruin and subversion. Most of these things Livy had in view when he wrote his history of the Roman state, as he acquaints his readers in the preface. "The accounts (says he) of what happened either before or while the city was building, consisting rather of poetical fables than any certain records of facts, I shall neither assert nor confute them. Let antiquity be allowed to make the origin of their cities more venerable, by uniting things human and divine. But if any nation may be suffered to fetch their origin from the gods, such is the military glory of the Romans, that when they represent Mars as the father of their founder, other nations may as easily acquiesce in this as they do in their government. But I lay no great stress upon these things, and others of the like nature, whatever may be thought of them. What I am desirous every one should carefully attend to, are our lives and manners: by what men, and what arts, civil and military, the empire was both acquired and enlarged: then let him observe, how our manners gradually declined with our discipline; afterwards grew worse and worse; and at length so far degenerated, that at present we can neither bear with our vices nor suffer them to be remedied. This is the chief benefit and advantage to be reaped from history, to fetch instruction from eminent examples of both kinds; in order to imitate the one, which will be of use both to yourself and your country, and avoid the other, which are equally base in their rise and event." Thus far Livy. And

tion of
History.

how well he has executed this design must be acknowledged by all who will be at the pains to peruse his work.

3. But as a particular history consists in a number of facts relating to the same state, suitably connected and laid together in a proper series; so a *general* history is made up of several particular histories, whose separate transactions within the same period of time, or part of it, should be so distinctly related as to cause no confusion. Such was the history of Diodorus Siculus, which contained an account of most of the eminent states and kingdoms in the world, though far the greatest part of it is now unhappily lost. Of the same nature is the history of Herodotus, though not so extensive; to whom we are especially indebted for the Persian affairs. And to this kind may likewise be referred Justin's history, though it be only the epitome of a larger work written by another hand. The rules proper for conducting such histories are much the same as those above mentioned concerning particular histories; excepting what relates to the *order*, of which we shall have occasion to speak hereafter.

But the histories both of particular states and those which are more general frequently contain only the affairs of some short period of time. Thus the history of the Peloponnesian war, written by Thucydides, comprises only what was done in the first twenty years of that war, which lasted seven years longer than his account reaches; though indeed the reason of that might be, because Thucydides died before the war was finished, otherwise he would very probably have continued his history to the conclusion of it. But the history of the war between the Romans and king Jugurtha in Africa, given us by Sallust, as also Cæsar's histories of the Gallic and civil wars, are all confined within a much less number of years than that of Thucydides. Nay, sometimes one single transaction is thought sufficient to furnish out an history. Such was the conspiracy of Catiline to subvert the Roman state, written likewise by Sallust. As to more general histories, Xenophon's history of Greece may be esteemed as such; which in order of time succeeds that of Thucydides, and contains the affairs of forty-eight years. And Polybius called his a *general history*; which, though it principally contained the Roman affairs, yet took in the most remarkable transactions of several other states, for the space of fifty-three years: though it has met with the same hard fate as that of Diodorus Siculus, so that only the first five books out of forty, of which it consisted at first, now remain entire. And to mention no more, the celebrated history of Thuanus is another instance of this sort, in which the principal transactions of Europe for about 60 years, chiefly in the 16th century, are described with that judgment and fidelity, and in a manner so accurate and beautiful, that he has been thought scarcely inferior to any of the ancient historians. Now, in such histories as these, to go farther back than is necessary to set the subject in a just light, seems as improper as it is unnecessary.

The general subject, or argument of history, in its several branches, may be reduced to these four heads; *narration, reflections, speeches, and digressions.*

1. By *narration* is meant a description of facts or

actions, with such things as are necessarily connected with them; namely, persons, time, place, design, and event.

As to *actions* themselves, it is the business of the historian to acquaint his readers with the manner in which they were performed; what measures were concerted on all sides, and how they were conducted, whether with vigilance, courage, prudence, and caution, or the contrary, according to the nature of the action; as likewise, if any unforeseen accidents fell out, by which the designed measures were either promoted or broken. All actions may be referred to two sorts, military and civil. And as war arises from injustice and injuries received on one side or the other, it is fit the reader should be informed who were the aggressors. For though war is never to be desired, yet it is sometimes necessary. In the description of battles, regard should be had equally to both parties; the number of forces, conduct of the generals, in what manner they engaged, what turns and chances happened in the engagement, either from accidents, courage, or stratagem, and how it issued. The like circumstances should all be observed in sieges and other actions. But the most agreeable scene of history arises from a state of peace. Here the writer acquaints us with the constitution of states, the nature of their laws, the manners and customs of the inhabitants, the advantages of concord and unanimity, with the disadvantages of contention and discord; the invention of arts and sciences, in what manner they were improved and cultivated, and by whom; with many other things, both pleasant and profitable in the conduct of life.

As to *persons*, the characters of all those should be described who act any considerable part in an history. This excites the curiosity of the reader, and makes him more attentive to what is said of them; as every one is more inquisitive to hear what relates to others in proportion to his knowledge of them. And it will likewise be of use to observe, how their actions agree with their characters, and what were the effects of their different qualifications and abilities.

The circumstances of *time* and *place* are carefully to be regarded by an historian, without which his accounts of facts will be frequently very lame and imperfect. And therefore chronology and geography seem not improperly to have been called *the two eyes of history*. Besides, they very much assist the memory: for it is much easier to remember any thing said to be done at such a time, and in such a place, than if only related in general; nay, the remembrance of these often recalls those things to mind which otherwise had been obliterated. By time is meant not only the year of any particular era or period; but likewise the season, as summer or winter; and the age of particular persons. For it is oftentimes from hence that we are principally enabled to make a just estimate of facts. Thus Cicero commends Pompey for undertaking and finishing the Piratic war at a season of the year when other generals would not have thought it safe to venture out at sea. This double danger, as well from the weather as the enemy, considering the necessity of the case, heightens the glory of the action; since to have done the same thing in summer would not have been an equal proof of the courage and

and intrepidity of the general. And there is nothing more surprising in the conquests of Alexander than that he should subdue so large a part of the world by the time he was little more than 30 years old; an age at which few other generals have been much distinguished. Had we not known this, a considerable part of his character had been lost.

The like advantages arise from the other circumstances of place. And therefore in marches, battles, and other military actions, the historian should take notice of the nature of the country, the passes, rivers, distances of places, situation of the armies, and strength of the towns either by nature or art; from which the reader may the better form a judgment of the difficulties and greatness of any enterprise. Cæsar is generally very particular in these things, and seems to have thought it highly requisite in order to give his readers a just idea of his actions. The descriptions of countries, cities, and rivers, are likewise both useful and pleasant; and help us to judge of the probability of what is related concerning the temper and genius of the inhabitants, their arts, traffic, wealth, power, or whatever else is remarkable among them.

But an accurate historian goes yet further, and considers the *causes* of actions, and what were the *designs* and views of those persons who were principally concerned in them. Some, as Polybius has well observed, are apt to confound the beginnings of actions with their springs and causes, which ought to be carefully separated. For the causes are often very remote, and to be looked for at a considerable distance from the actions themselves. Thus, as he tells us, some have represented Hannibal's besieging Saguntum in Spain, and passing the Ebro, contrary to a former agreement between the Romans and Carthaginians, as causes of the second Punic war. But these were only the beginnings of it. The true causes were the jealousies and fears of the Carthaginians from the growing power of the Romans; and Hannibal's inveterate hatred to them, with which he had been impressed from his infancy. For his father, whom he succeeded in the command of the Carthaginian army, had obliged him, when but nine years old, to take a most solemn oath upon an altar never to be reconciled to the Romans: and therefore he was no sooner at the head of the army, than he took the first opportunity to break with them. Again, the true springs and causes of actions are to be distinguished from such as are only feigned and pretended. For generally the worse designs men have in view, the more solicitous they are to cover them with specious pretences. It is the historian's business, therefore, to lay open and expose to view these arts of politicians. So, as the same judicious historian remarks, we are not to imagine Alexander's carrying over his army into Asia to have been the cause of the war between him and the Persians. That had its being long before. The Grecians had formerly two armies in Asia, one under Xenophon and the other commanded by Agesilaus. Now the Asiatics did not venture to oppose or molest either of these armies in their march. This made king Philip, Alexander's father, who was an ambitious prince, and aspired after universal monarchy, think it might be a practicable thing to make a conquest of Asia. Accordingly, he kept it in his view, and made preparations for it; but did not live to execute it. That was

left for his son. But as king Philip could not have done this without first bringing the other states of Greece into it, his pretence to them was only to avenge the injuries they had all suffered from the Persians; though the real design was an universal government, both over them and the Persians, as appeared afterwards by the event. But in order to our being well assured of a person's real designs, and to make the accounts of them more credible, it is proper we should be acquainted with his disposition, manners, way of life, virtues, or vices; that by comparing his actions with these, we may see how far they agree and suit each other. For this reason Sallust is so particular in his description of Catiline, and Livy of Hannibal; by which it appears credible, that the one was capable of entering into such a conspiracy against his country, and the other of performing such great things as are related concerning him. But if the causes of actions lie in the dark, and unknown, a prudent historian will not trouble himself or his readers with vain and trifling conjectures unless something very probable offers itself.

Lastly, an historian should relate the *issue* and *event* of the actions he describes. This is undoubtedly the most useful part of history; since the greatest advantage arising from it is to teach us experience from what has happened in the world before us. When we learn from the examples of others the happy effects of wisdom, prudence, integrity, and other virtues, it naturally excites us to an imitation of them, and to pursue the same measures in our own conduct. And, on the contrary, by perceiving the unhappy consequences which have followed from violence, deceit, rashness, or the like vices, we are deterred from such practices. But since the wisest and most prudent measures do not always meet with the desired success, and many cross accidents may happen to frustrate the best concerted designs; when we meet with instances of this nature, it prepares us for the like events, and keeps us from too great a confidence in our own schemes. However, as this is not commonly the case, but in the ordinary course of human affairs like causes usually produce like effects; the numerous examples of the happy consequences of virtue and wisdom recorded in history are sufficient to determine us in the choice of our measures, and to encourage us to hope for an answerable success, though we cannot be certain we shall in no instance meet with a disappointment. And therefore Polybius very justly observes, that "he who takes from history the causes, manner, and end of actions, and omits to take notice whether the event was answerable to the means made use of, leaves nothing in it but a bare amusement, without any benefit or instruction." These, then, are the several things necessary to be attended to in historical narrations; but the proper disposition of them must be left to the skill and prudence of the writer.

II. *Reflections* made by the writers. Some have con-

87
Of reflec-
tions.

demned these, as having a tendency to bias the reader; who should be left to draw such conclusions from the accounts of facts as he sees proper. But since all readers are not capable of doing this for themselves, what disadvantage is it for the author to suggest to them such observations as may assist them to make the best use of what they read? And if the philosopher is allowed

Composition of History.

allowed to draw such inferences from his precepts as he thinks just and proper, why has not the historian an equal right to make reflections upon the facts he relates? The reader is equally at liberty to judge for himself in both cases, without danger of being prejudiced. And therefore we find, that the best historians have allowed themselves this liberty. It would be easy to prove this by a large number of instances, but one or two here may suffice. When Salust has given a very distinct account of the designs of Catiline, and of the whole scheme of the conspiracy, he concludes it with this reflection: "All that time the empire of the Romans seems to me to have been in a very unhappy state. For when they had extended their conquests through the whole world from east to west, and enjoyed both peace and plenty, which mankind esteem their greatest happiness; some persons were obstinately bent upon their own ruin, and that of their country. For notwithstanding two decrees were published by the senate, not one out of so great a multitude was prevailed with, by the rewards that were offered, either to discover the conspiracy or to leave the army of Catiline. So desperate a disease, and as it were infection, had seized the minds of most people!" And it is a very handsome observation that Livy makes upon the ill-conduct of Hannibal in quartering his army in Capua after the battle of Cannæ; by which means they lost their martial vigour through luxury and ease. "Those (says he) who are skilled in military affairs reckon this a greater fault in the general, than his not marching his army immediately to Rome after his victory at Cannæ; for such a delay might have seemed only to defer the victory, but this ill step deprived him of the power to gain it." The modesty of the historian in this passage is worth remarking, in that he does not represent this as his own private opinion, and by that means undertake to censure the conduct of so great a general as Hannibal was, but as the sense of those who were skilled in such affairs. However, an historian should be brief in such remarks; and consider, that although he does not exceed his province by applauding virtue, expressing a just indignation against vice, and interposing his judgment upon the nature and consequences of the facts he relates; yet there ought to be a difference between his reflections and the encomiums or declamations of an orator.

88

Of speeches.

III. *Speeches* inserted by historians. These are of two sorts, oblique and direct. The former are such as the historian recites in his own person, and not in that of the speaker. Of this kind is that of Hannibal in Justin; by which he endeavours to persuade king Antiochus to carry the seat of the war against the Romans into Italy. It runs thus: "Having desired liberty to speak (he said), none of the present counsels and designs pleased him; nor did he approve of Greece for the seat of the war, which might be managed in Italy to greater advantage: because it was impossible to conquer the Romans but by their own arms, or to subdue Italy but by its own forces; since both the nature of those men, and of that war, was different from all others. In other wars, it was of great importance to gain an advantage of place or time, to ravage the countries and plunder the towns; but though you gain some advantage over the Romans, or defeat

them, you must still fight with them when beaten. Wherefore, should any one engage with them in Italy, it was possible for him to conquer them by their own power, strength, and arms, as he himself had done; but should he attempt it out of Italy, the source of their power, he would be as much deceived, as if he endeavoured to alter the course of a river, not at the fountain-head, but where its streams were largest and deepest. This was his judgment in private, and what he had offered as his advice, and now repeated in the presence of his friends; that all might know in what manner a war ought to be carried on against the Romans, who were invincible abroad, but might be conquered at home. For they might sooner be driven out of their city than their empire, and from Italy than their province; having been taken by the Gauls, and almost subdued by himself. That he was never defeated till he withdrew out of their country; but upon his return to Carthage, the fortune of the war was changed with the place." He seems to intimate by this speech, that the Romans were like some fierce and impetuous animals, which are no otherwise to be subdued than by wounding them in some vital part. In speeches related after this manner, we are not necessarily to suppose the historian gives us the very words in which they were at first delivered, but only the sense. But in direct speeches, the person himself is introduced as addressing his audience; and therefore the words as well as the sense are to be suited to his character. Such is the speech of Eumenes, one of Alexander's captains and successors, made to his soldiers when they had traiterously bound him in chains, in order to deliver him up to his enemy Antigonus, as we have it in the same writer. "You see, soldiers (says he), the habits and ornaments of your general, which have not been put upon me by mine enemies; that would afford me some comfort: it is by you, that of a conqueror I am become conquered, and of a general a captive; though you have sworn to be faithful to me four times within the space of a year. But I omit that, since reflections do not become persons in calamity. One thing I intreat, that, if Antigonus must have my life, you would let me die among you. For it no way concerns him how or where I suffer, and I shall escape an ignominious death. If you grant me this, I free you from your oath, with which you have been so often engaged to me. Or, if shame restrains you from offering violence to me at my request, give me a sword, and suffer your general to do that for you without the obligation of an oath which you have sworn to do for your general."

But this likewise is a matter in which critics have been divided in their sentiments; whether any, or what kind, of speeches ought to be allowed in history. Some have thought all speeches should be excluded: and the reason given for that opinion is this; that it breaks the thread of the discourse, and interrupts the reader, when he is desirous to come to the end of an action, and know how it issued. This is true, indeed, when speeches are either very long or too frequent; but otherwise they are not only entertaining, but likewise instructive. For it is of service to know the springs and reasons of actions; and these are frequently opened and explained in the speeches of those by whom they were performed. Others therefore have not been

against

against all speeches in general, but only direct ones. And this was the opinion of Trogus Pompeius, as Justin informs us; though he did not think fit to follow him in that opinion, when he abridged him, as we have seen already by the speech of king Eumenes. The reason offered against direct speeches is, because they are not true; and truth is the foundation of all history, from which it never ought to depart. Such speeches, therefore, are said to weaken the credit of the writer; since he who will tell us that another person spoke such things which he does not know that he ever did speak, and in such language as he could not use, may take the same liberty in representing his actions. Thus, for example, when Livy gives us the speeches of Romulus, the Sabine women, Brutus, and others, in the first ages of the Roman state, both the things themselves are imaginary, and the language wholly disagreeable to the times in which those persons lived. Accordingly we find, that when several historians relate some particular speech of the same person, they widely differ both in the subject-matter and expressions. So the speech of Veturia, by which she dissuaded her son Coriolanus from besieging Rome when he came against it with an army of Volscians to avenge the injuries he had received, is very differently related by Livy, Dionysius of Halicarnassus, and Plutarch. Such fictitious speeches therefore are judged more fit for poets, who are allowed a greater liberty to indulge their fancy than historians. And if any direct speeches are to be inserted, they should be such only as were really spoken by the persons to whom they are ascribed, where any such have been preserved. These have been the sentiments of some critics both ancient and modern. However, there is scarce an ancient historian now extant, either Greek or Latin, who has not some speeches, more or less, in his works; and those not only oblique, but also direct. They seem to have thought it a necessary ornament to their writings: and even where the true speeches might be come at, have chosen rather to give them in their own words; in order, probably, to preserve an equality in the style. Since therefore the best and most faithful historians have generally taken this liberty, we are to distinguish between their accounts of facts and their speeches. In the former, where nothing appears to the contrary, we are to suppose they adhere to truth, according to the best information they could get; but in the latter, that their view is only to acquaint us with the causes and springs of actions, which they chose to do in the form of speeches, as a method most ornamental to the work, and entertaining to the reader: Though the best historians are cautious of inserting speeches, but where they are very proper, and upon some solemn and weighty occasions. Thucydides is said to have been the first who brought complete and finished speeches into history, those of Herodotus being but short and imperfect. And though Dionysius of Halicarnassus, in his censure upon Thucydides, seems then to have disliked that part of his conduct; yet he afterwards thought fit to imitate it in his *Antiquities of Rome*, where we find many not only oblique, but also direct speeches.

What has been said of speeches, may likewise be understood of letters, which we sometimes meet with in histories; as that of Alexander to Darius in Q.

Curtius, those of Tiberius and Drusus in Tacitus, and many others. Some letters are wholly fictitious; and in others perhaps the historian represents the substance of what was really said, but gives it his own dress. Thus we find that short letter of Lentulus to Cataline at the time of his conspiracy differently related by Cicero and Sallust. The reason of which seems to be this: That as Cicero recited it publicly to the people of Rome in his third oration against Catiline, it is reasonable to imagine he did it in the very words of the letter, which he had by him; whereas Sallust, as an historian, might think it sufficient to give the sense of it in his own words.

IV. *Digressions.* These, if rightly managed, afford the reader both delight and profit. Like speeches, they should neither be too long nor frequent; lest they interrupt the course of the history, and divert the reader from the main design of the work. But now and then to introduce a beautiful description, or some remarkable incident, which may give light to the subject, is so far from an interruption, that it is rather a relief to the reader, and excites him to go on with greater pleasure and attention. See further on this head, ORATORY, n^o 37.

ART. III. OF ORDER.

SINCE most histories consist of an introduction and the body of the work, in each of which some order is requisite, we shall speak to them separately.

I. The design of the introduction is the same here as in orations. For the historian proposes three things by his introduction, which may be called its parts; to give his reader some general view of the subject, to engage his attention, and to possess him with a candid opinion of himself and his performance. Some have thought this last unnecessary for an historian. But if we consider how differently mankind are apt to judge of the same persons and actions, it seems as requisite for an historian to be well esteemed as an orator. And therefore we find some of the best historians have not omitted this part. Livy's introduction has been very much applauded by the learned, as a master-piece in its kind. It begins with an account of his design. "Whether (says he) it may answer any valuable end for me to write the history of the Roman affairs from the beginning of the city, I neither am certain, nor if I was should I venture to declare it." Soon after he endeavours to prepare the reader's attention, by representing the grandeur and usefulness of the subject in the following words: "Either I am prejudiced in favour of my subject, or there never was any state greater, more virtuous, and fruitful of good examples, or in which avarice and luxury had a later admittance, or poverty and thriftiness were either more highly or longer esteemed, they always coveting less the less they enjoyed." And then he presently proceeds to ingratiate himself with his readers, and gain their favourable opinion: "Although my name is obscure in so great a number of writers, yet it is a comfort that they cloud it by their fame and character. But I shall gain this advantage by my labour, that I shall be diverted for a time from the prospect of those evils which the age has seen for so many years; while my mind is wholly intent upon former times, free from all that care which gives the writer an uneasiness, though it cannot

bias him against the truth." In this passage we see he endeavours to gain the good esteem of his readers from two very powerful motives, modesty and a strict regard to truth. It may scarce seem necessary to observe, that those introductions are esteemed the best which are most natural; that is, such as are taken from the subject-matter of the history itself, and closely connected with it. Such are those of Herodotus, Thucydides, Livy, Tacitus, and others. And therefore Sallust is greatly blamed by Quintilian on the account of his introductions, which are so general, that they might suit other histories as well as those to which they are prefixed. Introductions should likewise be proportioned to the length of the work. We meet with some few histories, in which the writers immediately enter upon their subject, without any introduction; as Xenophon in his Expedition of the younger Cyrus, and Cæsar in his Commentaries of the Gallic and Civil Wars. But the latter does not profess to write a just history; and therefore left himself more at liberty, as well in this respect as in some others.

2. But order is principally to be regarded in the body of the work. And this may be managed two ways; either by attending to the time in a chronological series, or the different nature and circumstances of the things contained in the history. However, as these two methods do not equally suit all subjects, we shall a little consider to what kind of histories each of them seems more properly adapted. All history then, as we have observed already, may be reduced to three sorts; *biography*, the *history of particular states*, and the *general history of several states* existing at the same time.

In biography, or the lives of particular persons, most writers follow the order of time; though some reduce them to certain general heads, as their virtues and vices, or their public and private character. Plutarch and Cornelius Nepos have taken the former method, and Suetonius the latter.

As to the history of particular states, the order of time is generally best, as being most natural and easy. And therefore it has usually been observed by the best historians, as Thucydides, Livy, and others. Tacitus, indeed, wrote two distinct works; one of which he called *Annals*, and the other *Histories*. And as in both he has kept to the order of time, critics have been at a loss to assign any other reason for these different titles, unless that in the former work he confines himself more closely to the facts themselves, and does not treat so largely upon the causes, manner, or event of them, as he has done in the latter. And even in the circumstances of facts, there is a certain order proper to be observed, for rendering the account more plain and intelligible. Thus, for instance, in the description of a battle or siege, the time should first be known, then the chief person or persons who conducted it, then the number of forces, and other requisites, afterwards the nature of the place, then the action itself, and lastly the event. But sometimes it is necessary to add the time in which several of the other circumstances happened, especially in actions of any considerable length. Where the order of these circumstances is confused, it perplexes the account, and renders it both less entertaining to the reader, and more difficult to remember.

Composi-
tion of
History.

In a general history, the order of time cannot always be preserved; though, where the actions of different communities have respect to one as the principal, they should all, as far as possible, be referred to the transactions of that state. But even here the several affairs of those different states ought to be related separately, which will necessarily occasion the anticipating some things, and postponing others, so that they cannot all stand in the order of time in which they were performed. However, Velleius Paterculus says very justly with regard to this subject, "That every entire action, placed together in one view, is much better apprehended than if divided by different times." In this case, therefore, for better preserving the chronology, it is usual with historians, when they have finished any particular narrative, in passing to the next, to express the time by some short and plain transition; and sometimes to apologize for themselves, by assigning the reasons of their conduct. So Polybius, whose history is of this kind, says concerning himself: "As in writing the actions of each year, in the order of time, I endeavour to represent the affairs of the same nation together in one summary view, it is plain that inconvenience must of course attend this way of writing." Curtius professes only to write the actions of Alexander king of Macedon; but his history contains in it the principal affairs of the greatest states in the world during that period. Now although, in the course of those transactions, the war between Archelaus governor of Macedonia, and Agis king of Sparta, happened before the battle of Alexander at Arbela; yet the historian not only relates that battle first, but carries on the account of Alexander's affairs in Asia to the death of Darius without interruption; for which he gives this reason: "If I should relate the affairs of Alexander, which happened in the mean time, either in Greece or Illyrium and Thrace, each in their proper order and time, I must interrupt the affairs of Asia; which it is much better to represent together in one continued series as they fell out, to the flight and death of Darius." Such anachronisms, *Lib. v.* therefore, are nothing more than what necessarily arise *init.* sometimes from the nature of the subject: As every thing, the more complex it is, and contains under it a great number of parts, is more difficult to be digested in a regular order. But in an history composed of several states, whose affairs are independent of one another, the actions of each nation must necessarily be separated, in order to represent them in a just view, and prevent confusion. This is the method which Herodotus has taken, as likewise Diodorus Siculus and Juttin. Now both the pleasure and benefit which such histories afford, arise from observing the conduct of each state separately in the course of their affairs, and then comparing one with the other. And as the order of time must frequently be interrupted, it is not unusual to continue the chronology at proper distances in relating the affairs of each nation; which preserves an unity in the whole, and connects it in one consistent body.

The division of histories into books was designed only for the better distinction of the subject and ease of the reader. And the dividing these books again into chapters, is rather a practice of later editors (founded, as they have thought, on the same reasons),

Composi-
tion of
History.

sons) than countenanced by the example of ancient writers.

ART. IV. Of STYLE.

90
Of style.

AN historical style is said to be of a middle nature, between that of a poet and an orator, differing from both not only in the ornamental parts, but likewise in the common idioms and forms of expression.

De Clar.
Orat. c. 75.

Cicero observes, that "nothing is more agreeable in history than brevity of expression, joined with purity and perspicuity." Purity indeed is not peculiar to history, but yet is absolutely necessary; for no one will ever think him fit to write an history who is not master of the language in which he writes: and therefore when Albinus had written an history of the Roman affairs in Greek, and apologized for any slips or improprieties that might be found in the language upon the account of his being a Roman, Cato called him a trifler, for choosing to do that which, after he had done it, he was obliged to ask pardon for doing. Nor is perspicuity less requisite in an historical style. The nature of the subject plainly directs to this. For as history consists principally in narration, clearness and perspicuity is nowhere more necessary than in a relation of facts. But these two properties are to be accompanied with brevity, since nothing is more disagreeable than a long and tedious narrative. And in this respect an historical style differs both from that of poetry and oratory. For the poet frequently heightens and enlarges his descriptions of facts, by dwelling upon every circumstance, placing it in different views, and embellishing it with the finest ornaments of wit and language, to render his images more agreeable; and the orator often does the like, with a design to strike the passions. But such colouring is not the business of an historian, who aims at nothing more than a just and faithful representation of what he relates, in a way best suited to its nature, and in such language as is most proper to set it in a plain and easy light.

De Orat.
lib. ii.
c. 15. 20.

Again, Cicero, treating of an historical style, says: "It ought to be fluent, smooth, and even, free from that harshness and poignancy which is usual at the bar." The properties here mentioned distinguish this style from that of judicial discourses, in which the orator often finds it necessary to vary his manner of speaking, in order to answer different views, either of pursuing an argument, pressing an adversary, addressing a judge, or recommending the merits of his cause. This occasions an inequality in his style, while he speaks sometimes directly, at other times by way of question, and intermixes short and concise expressions with round and flowing periods. But the historian has no necessity for such variations in his style. It is his province to espouse no party, to have neither friend nor foe, but to appear wholly disinterested and indifferent to all; and therefore his language should be smooth and equal in his relations of persons and their actions.

Epist. ad
Cn. Pom-
peium.

But further: Dionysius makes "decency a principal virtue in an historian;" which he explains by saying, that "he ought to preserve the characters of the persons and dignity of the actions of which he treats." And to do this it seems necessary that an historical style should be animated with a good degree of life and vigour; without which neither the characters of eminent persons, nor their remarkable actions, which

make up the main business of history, can be duly represented: for even things in themselves great and excellent, if related in a cold and lifeless manner, often do not affect us in a degree suitable to their dignity and importance. And this seems particularly necessary in speeches, in order to represent what every one says, according to his different country, age, temper, and station of life, in the same manner we may suppose he either really did, or would have spoken himself on that occasion. Besides, there are some scenes of action which require very pathetic and moving language to represent them agreeably to their nature. And in descriptions, the most beautiful tropes and lively figures are often necessary to set the ideas of things in a proper light. From whence it appears, that painting and imagery make up no small part of the historian's province, though his colour are not so strong and glittering as those either of the poet or orator. He ought therefore to be well acquainted with the manners of men and the nature of the passions, since he is often obliged to describe both; in the former of which Herodotus excels, and Thucydides in the latter, as Dionysius has observed.

Now from these several properties laid down by ancient writers, as requisite for an historical style, it seems upon the whole to agree best with the middle character. And this will further appear, by what they say relating to the ornamental parts of style; namely, composition and dignity. As to the former of these, which respects the structure of sentences, and the several parts of them, Demetrius remarks, that "An historical period ought neither to rise very high, nor sink very low, but to preserve a medium." This simplicity (he says) "becomes the gravity and credit of history; and distinguishes it from oratory on the one hand, and dialogue on the other." His meaning is, that historical periods should neither be so full and sonorous as is frequent in oratory; nor yet so short and flat, as in dialogue: the former of which, as he says, require a strong voice to pronounce them; and the latter have scarce the appearance of periods. So that according to this judicious writer, the periods best suited for history are those which, being of a moderate length, will admit of a just rise and cadency, and may be pronounced with ease. And Dionysius tells us, that "History should flow smooth and even, every where consistent with itself, without roughness or chasms in the sound." This relates to the harmony of periods, which arises from such a position of the words, as renders the sound pleasant and agreeable, and, as he thinks, ought to be attended to in history. And as to dignity, which respects the use of tropes and figures, the same author says, that "History should be embellished with such figure as are neither vehement nor carry in them the appearance of art." This is agreeable to what Cicero observes, in comparing Xenophon and Calisthenes, two Greek historians. "Xenophon the Socratic (says he) was the first philosopher, and after him Calisthenes, the scholar of Aristotle, who wrote an history: the latter almost like a rhetorician; but the style of the former is more moderate, and has not the force of an orator, less vehement perhaps, but in my opinion more sweet and pleasant." The difference between these two writers, with regard to their style, consisted chiefly in the choice of their

Composi-
tion of
History.

De Orat.
lib. ii.
c. 14.

Composi-
tion of
History.

their figures; which in Xenophon were more gentle and moderate, and therefore in the judgment of Cicero more agreeable to history.

But notwithstanding this general account of the several properties which constitute an historial style, it admits of considerable varieties from the different nature and dignity of the subject. The lives of particular persons do not require that strength and majesty of expression, nor all those ornaments of language, as an history of the Roman empire. And accordingly we find the style of Nepos and Suetonius very different from that of Livy. The former is smooth and easy, scarce rising above the low character: but the latter often approaches near to the sublime. And other historians again have kept a medium between these. Upon the whole, therefore, we may conclude, that the middle style is the proper character for history; though historians may sometimes sink into the low character, and at other times rise to the grandeur and magnificence of the sublime, from the different nature of their subject, or some particular parts of it. For that is to be esteemed the proper character of any writing which in the general best suits it.

EXPLANATION OF THE CHART.

Plate
CCXXXVII.

By this plan events may be referred to the year of the world; and, within the proper periods, to the aeras of the Olympiads, of Nabonassar, and of Rome; but the principal reference is to the birth of Christ, marked by a deep black line.

The plan extends only to the Flood; the preceding period of 1656 years is therefore left blank in the chart.

There being 2348 years from the Flood to the birth of Christ, the space between them is divided into 23 parts, each representing an hundred years or century, and a fraction representing the remaining 48 years.

As we are now in the 18th century, the space from the birth

of Christ downwards is divided into eighteen parts or centuries: and all these parts, together with some centuries preceding the birth of Christ, are subdivided into tens.

The vertical columns, titled at top, are geographical divisions; and events are marked in their proper centuries and proper columns. Thus the rise of any state, as that of Assyria, is marked in its proper geographical column, and in that place of the 21st century before Christ at which the beginning of its history is dated; from thence we trace its continuance to the end of the 7th century before Christ, when it became extinct. The building of Rome is marked about the middle of the 8th century before Christ. Its territory extends by degrees to the conquest of all Italy; next to Spain, Macedonia, &c. until it comes to extend from Britain to Egypt. It continues of this greatness until about the middle of the 5th century after Christ, when it begins to lose those provinces out of which the modern kingdoms of Europe have been formed in the order here set down.—As the order in which states have risen or fallen, relatively to one another, appears on mere inspection, it will be more easily remembered than when it is conveyed in numbers alone.

The dates are taken chiefly from that comprehensive and useful work, Blair's Chronological Tables. Use has likewise been made of the Chart of Universal History, formed on a design like this, but differently executed.—Compared to that chart, the present may be thought incomplete. Nor would it have been difficult for the gentleman who sketched it, to have filled it up with remarkable events, successions of kings, and lives of men; but he preferred clearness and simplicity, leaving to every person the filling up of his own plan with such articles as are most in the way of his curiosity and study. He has contented himself with a few specimens of this sort, in the succession of the Roman emperors, of the kings of England and France; and in the lives of one or two remarkable men, as in those of Tacitus the historian, and Attila. One person may choose to fill his plan with the names of statesmen and warriors, another with scholars and men of letters. To attempt inserting all that deserve being recorded, would crowd and embarrass the whole.

As space is here employed to represent time, it is material that equal periods should be represented by equal spaces; and, if possible, that the parts of the same empire should be placed together. Both these circumstances are neglected in the Chart of Universal History.

H O A

History
||
Hithe.

HISTORY of Nature. See *NATURAL History*.

HISTRIO, in the ancient drama, signified an actor or comedian; but more especially a pantomime, who exhibited his part by gestures and dancing. Livy informs us, that the histriones were brought to Rome from Etruria, in the year of the city 391.

HISTRIX. See **HYSTRIX**.

HITCHING, a large and populous town of Hartfordshire in England, situated near a large wood called *Hitchwood*. The manor was the ancient demesne of the kings of England, as it continues at this day; and it has been the dower of several of their queens. The town is reckoned the second in the county for number of streets, houses, and inhabitants. It was formerly famous for the staple commodities of the kingdom, and divers merchants of the staple of Calais resided here, since which that trade is lost. The inhabitants now make large quantities of malt; and the market is one of the greatest in England for wheat. W. Long. *o.* 20. N. Lat. 51. 55.

HITHE, a town of Kent in England, 70 miles from London. It is one of the cinque ports; and had formerly five parishes, but by the choaking up of its harbour and other accidents is now reduced to one. It was first incorporated by the name of *barons of the town and port of Hith*; but the government was afterwards changed. It was incorporated by Queen Elizabeth with the name of the mayor, jurats, and commonalty of the town and port of Hith, who with the free-

men elect the members of parliament. The mayor is chose yearly on Candlemas day. Here is a market on Saturdays, and fairs in July and December. There is a remarkable pile of dry bones, 28 feet long, 6 broad, and 8 high, kept in a vault under the church in as good order as books in a library, consisting of several thousand heads, arms, legs, thigh-bones, &c. appear by an inscription to be the remains of the Danes and Britons killed in a battle near this place, before the Norman conquest. From hence to Boulogne is reckoned the shortest cut to France.

HITTITES, the descendents of Heth. See **HETH**.

HIVE, in country affairs, a convenient receptacle for bees. See **APIS** and **BEE**.

HIVITES, a people descended from Canaan. They dwelt at first in the country which was afterwards possessed by the Caphtorims, or Philistines. There were Hivites likewise at Shechem and Gibeon, and consequently in the centre of the promised land; for the inhabitants of Shechem and the Gibeonites were Hivites, (Josh. xi. 19. Gen. xxxiv. 2.) Lastly, there were some beyond Jordan, at the foot of mount Hermon (Joshua xi. 3.)

HOACHE, in natural history, a kind of earth approaching to the nature of chalk, but harder and feeling like soap; whence some think that it is either the same with the soap-rock of Cornwall, or very like it. The Chinese dissolve it in water till the liquor is of the consistence of cream, and then varnish their China ware with it.

HOADLEY.

Hittites
||
Hoache.

Hoadley.

HOADLEY (Benjamin), successively bishop of Bangor, Hereford, Salisbury, and Winchester, was born in 1676. His first preferment in the church was the rectory of St Peter le Poor, and the lectureship of St Mildred's in the Poultry. In the year 1706, he published some Remarks on the late bishop Atterbury's sermon at the funeral of Mr Bennet, in which Dr Atterbury had, in the opinion of Mr Hoadley, laid down some dangerous propositions. Two years after, Mr Hoadley again entered the lists against this formidable antagonist; and in his *exceptions* against a sermon published by Dr Atterbury, intitled "The Power of Charity to cover Sin," he attacked the doctor with his usual strength of reasoning and dispassionate inquiry. In 1709, another dispute arose between these two learned combatants, concerning the doctrine of non-resistance, occasioned by a performance of Mr Hoadley's, intitled "The Measures of Obedience;" some positions in which Dr Atterbury endeavoured to confute in his elegant Latin sermon, preached that year before the London clergy. In this debate Mr Hoadley signalized himself in so eminent a degree, that the honourable house of commons gave him a particular mark of their regard, by representing, in an address to the queen, the signal services he had done to the cause of civil and religious liberty.—The principles, however, which he espoused being repugnant to the general temper of those times, drew on him the virulence of a party; yet it was at this period (1710, when, as he himself expressed it, *fury seemed to be let loose upon him*) that the late Mrs Howland presented him to the rectory of Streatham in Surrey, unasked, unapplied to, and without his either having seen her or been seen by her. Soon after the accession of king George I. Mr Hoadley was consecrated to the see of Bangor; and, 1717, having broached some opinions concerning the nature of Christ's kingdom, &c. he again became the object of popular clamour. At this juncture he was distinguished by another particular mark of the royal regard, by means of which the convocation was successively prorogued, and it was not permitted to sit, nor do any business, till that resentment was entirely subsided. In 1721 he was translated to Hereford; and from thence, in 1723, to Salisbury. In 1734, he was translated to Winchester (on the demise of Dr Willis), and published his *Plain Account of the Sacrament*: a performance which served as a butt for his adversaries to shoot at, yet impartially owns it to be clear, rational, and manly, wrote with great candour and judgment, and suited to the capacity of every serious and considerate inquirer after truth.—His latter days were embittered by a most vile instance of fraud and ingratitude. The bishop took a French priest, who pretended to abjure his religion, under his protection, with no other recommendation than that of his necessities; in return for which act of humanity, the priest found an opportunity of getting the bishop's name written by his own hand, and, causing a note of some thousand pounds to be placed before it, offered it in payment. But the bishop denying it to be his, it was brought before a court of justice, and was there found to be a gross imposition. The ungrateful villain had now recourse to a pamphlet, in which he charged the bishop with being a drunkard; and alleged that he had the note of him when he was

VOL. VIII. Part II.

in liquor. To this calumny the bishop made a full and nervous answer; in which he exposed the man's falsehood, and solemnly averred that he was never drunk in his whole life. The world with becoming ardour embraced his defence, and he had the happiness to find himself perfectly acquitted even of any suspicion of such a charge. As a writer, he possessed uncommon abilities. His sermons (published in 1754 and 1755) are esteemed inferior to few writings in the English language, for plainness and perspicuity, energy and strength of reasoning, and a free and masterly manner. In private life, he was naturally facetious, easy, and complying; fond of company, yet would frequently leave it for the purposes of study or devotion. He was every where happy; and particularly in his own family, where he took all opportunities of instructing by his influence and example. He died in 1761, aged 83. Besides the works already mentioned, he wrote, 1. *Terms of Acceptance*, 8vo. 2. *Reasonableness of Conformity*. 3. *On the Sacrament*. His tracts and pamphlets are extremely numerous; and the reader may see a complete catalogue of them in his life inserted in the supplement to the *Biographia Britannica*.

HOADLEY (Benjamin, M. D.), son of the former, was born in 1706; and studied at Bennet college Cambridge, under the tuition of Dr Herring afterwards archbishop of Canterbury. He took his degree in physic; and particularly applying himself to mathematical and philosophical studies, was, when very young, admitted a member of the royal society. He was made register of Hereford while his father filled that see, and was early appointed physician to his majesty's household, but died at his house in Chelsea in 1757. He wrote, 1. *Three Letters on the organs of respiration*, 4to. 2. *The Suspicious Husband*, a comedy. 3. *Observations on a series of electrical experiments*; and, 4. *Oratio anniversaria, in Theatro Col. Med. Londin. ex Harvei instituto habita die Octob. 1742*.

HOAI-NGAN-FOU, a city of China, in the province of Hiang-nan. According to Grosier, it is situated in a marsh, and is enclosed by a triple wall. As the ground on which it stands is lower than the bed of the canal, the inhabitants live in continual dread of an inundation. The suburbs extend to the distance of a league on each side of the canal, and form at their extremity a kind of port on the river Hoang-ho. This place is very populous, and every thing in it announces an active and brisk trade. One of those great mandarins, who have the inspection of the canals and navigation, and who are also obliged to supply the court with necessary provisions, resides here. This city has eleven other under its jurisdiction; two of which are of the second, and nine of the third class.

HOAR-HOUND, in botany. See MARUBIUM.

HOARSENESS, in medicine, a diminution of the voice, commonly attended with a preternatural asperity and roughness thereof. The parts affected are the *aspera arteria* and larynx. For its causes and cure, see (the *Index* subjoined to) MEDICINE.

HOBAL, in mythology, an idol of the ancient Arabs, the worship of which at Mecca was destroyed by Mahomet.

HOBBS (Thomas), a famous writer, born at Malmesbury in 1588, was the son of a clergyman. He

Hoadley

||
Hobbes.

Hobbes. completed his studies at Oxford, and was afterwards governor to the eldest son of William Cavendish earl of Devonshire. He travelled through France and Italy with that young nobleman, and at length applied himself entirely to the study of polite literature. He translated Thucydides into English; and published his translation in 1628, in order to show his countrymen, from the Athenian history, the disorders and confusions of a democratical government. In 1626 his patron the earl of Devonshire died; and in 1628 his son died also: which loss affected Mr Hobbes to such a degree, that he very willingly accepted an offer made him of going abroad a second time with the son of Sir Gervase Clifton; whom he accordingly accompanied into France, and staid there some time. But while he continued there, he was solicited to return to England, and to resume his concern for the hopes of that family to whom he had attached himself so early, and to which he owed so many and so great obligations. In 1631, the countess dowager of Devonshire desired to put the young earl under his care, who was then about the age of 13. This was very suitable to Mr Hobbes's inclinations, who discharged that trust with great fidelity and diligence. In 1634, he republished his translation of Thucydides, and prefixed to it a dedication to that young nobleman, in which he gives a large character of his father, and represents in the strongest terms the obligations he was under to that illustrious family. The same year he accompanied his noble pupil to Paris, where he applied his vacant hours to the study of natural philosophy, and more especially to the perfect understanding of mechanism, and the causes of animal motion. He had frequent conversations upon these subjects with father Marin Mersenne; a man deservedly famous, and who kept up a correspondence with almost all the learned in Europe. From Paris he attended his pupil into Italy, where at Pisa he became known to that great astronomer Galileo Galilei, who communicated to him his notions very freely; and after having seen all that was remarkable in that country, he returned with the earl of Devonshire into England. Afterwards, foreseeing the civil wars, he went to seek a retreat at Paris; where, by the good offices of his friend father Mersenne, he became known to the famous Renatus des Cartes, and afterwards held a correspondence with him upon several mathematical subjects, as appears from the letters of Mr Hobbes published in the works of Des Cartes. But when this philosopher printed afterwards his Meditations, wherein he attempted to establish points of the highest consequence from innate ideas, Mr Hobbes took the liberty of dissenting from him; as did also the French king's mathematical professor, the illustrious Peter Gassendi, with whom Mr Hobbes contracted a very close friendship, which was not interrupted till the death of the former. In 1642, Mr Hobbes printed a few copies of his famous book *De Cive*, which, in proportion as it became known, raised him many adversaries, who charged him with instilling principles which had a dangerous tendency. Among many illustrious persons who, upon shipwreck of the royal cause, retired to France for safety, was Sir Charles Cavendish, brother to the duke of Newcastle: and this gentleman, being skilled in every branch of the mathematics, proved a

constant friend and patron to Mr Hobbes; who, by Hobbes. embarking in 1645 in a controversy about squaring the circle, was grown so famous for it, that in 1647 he was recommended to instruct Charles prince of Wales, afterwards king Charles II. in that kind of learning. His care in the discharge of this office gained him the esteem of that prince in a very high degree: and tho' he afterwards withdrew his public favour to Mr Hobbes on account of his writings, yet he always retained a sense of the services he had done him; showed him various marks of his favour after he was restored to his dominions; and, as some say, had his picture hanging in his closet. This year also was printed in Holland, by the care of M. Sorbier, a second and more complete edition of his book *De Cive*; to which are prefixed two Latin letters to the editor, the one by Mr Gassendi, the other by father Mersenne, in commendation of it: and in 1650 was published at London a small treatise of Mr Hobbes's, intitled, *Human Nature*; and another, *De corpore politico*, or "Of the elements of the law."

All this time Mr Hobbes had been digesting with great care and pains his religious, political, and moral principles, into a complete system, which he called the *Leviathan*, and which was printed in English at London in 1650 and 1651. After the publication of his *Leviathan* he returned to England, and passed the summer commonly at his patron the earl of Devonshire's seat in Derbyshire, and some of his winters in town, where he had for his intimate friends some of the greatest men of the age. In 1660, upon the restoration, he quitted the country, and came up to London, where he obtained from the king assurance of protection, and had an annual pension of L. 100 settled upon him out of the privy purse. Yet this did not render him entirely safe: for, in 1666, his *Leviathan* and his treatise *De Cive* were censured by parliament; which alarmed him very much, as did also the bringing in of a bill into the house of commons to punish atheism and profaneness. When this storm was a little blown over, he began to think of procuring a beautiful edition of his pieces that were in Latin; but finding this impracticable in England, he caused it to be undertaken abroad, where they were published in quarto in 1668, from the press of John Bleau. In 1669, he was visited by Cosmo de Medicis, then prince, afterwards duke of Tuscany, who gave him ample marks of his esteem and respect; and having received his picture, and a complete collection of his writings, caused them to be repositied, the former among his curiosities, the latter in his noble library at Florence. The like visits he received from foreign ambassadors and other strangers of distinction; who were curious to see a person whose singular opinions and numerous writings had made so much noise all over Europe. In 1672, he wrote his own life in Latin verse, when, as he observes, he had completed his 84th year: and, in 1674, he published in English verse four books of Homer's *Odyssey*; which was so well received, that it encouraged him to undertake the whole *Iliad* and *Odyssey*, which he likewise performed and published in 1675. About this time he took his leave of London, and went to spend the remainder of his days in Derbyshire: where, however, he did not remain inactive, notwithstanding his advanced

Hobbes. vanced age; but published from time to time several pieces, to be found in the collection of his works. He died in 1679, aged 92.

As to his character and manners, they are thus described by Dr White Kennet, in his Memoirs of the Cavendish family. "The earl of Devonshire (says he) for his whole life entertained Mr Hobbes in his family, as his old tutor, rather than as his friend or confidant. He let him live under his roof in ease and plenty, and in his own way, without making use of him in any public, or so much as domestic affairs. He would often express an abhorrence of some of his principles in policy and religion; and both he and his lady would frequently put off the mention of his name, and say, 'He was a humorist, and nobody could account for him.' There is a tradition in the family, of the manners and customs of Mr Hobbes, somewhat observable. His professed rule of health was to dedicate the morning to his exercise, and the afternoon to his studies. And therefore, at his first rising, he walked out, and climbed any hill within his reach; or if the weather was not dry, he fatigued himself within doors by some exercise or other, to be in a sweat; recommending that practice upon this opinion, that an old man had more moisture than heat, and therefore by such motion heat was to be acquired and moisture expelled. After this, he took a comfortable breakfast; and then went round the lodgings to wait upon the earl, the countess, and the children, and any considerable strangers, paying some short addresses to all of them. He kept these rounds till about 12 o'clock, when he had a little dinner provided for him, which he eat always by himself without ceremony. Soon after dinner he retired to his study, and had his candle with 10 or 12 pipes of tobacco laid by him; then shutting his door, he fell to smoking, thinking, and writing, for several hours. He retained a friend or two at court, and especially the lord Arlington, to protect him if occasion should require. He used to say, that it was lawful to make use of ill instruments to do ourselves good: 'If I were cast (says he) into a deep pit, and the devil should put down his cloven foot, I would take hold of it to be drawn out by it.' After the restoration, he watched all opportunities to ingratiate himself with the king and his prime ministers; and looked upon his pension to be more valuable, as an earnest of favour and protection, than upon any other account. His future course of life was to be free from danger. He could not endure to be left in an empty house. Whenever the earl removed, he would go along with him, even to his last stage, from Chatsworth to Hardwick. When he was in a very weak condition, he dared not to be left behind, but made his way upon a feather-bed in a coach, though he survived the journey but a few days. He could not bear any discourse of death, and seemed to cast off all thoughts of it: he delighted to reckon upon longer life. The winter before he died, he made a warm coat, which he said must last him three years, and then he would have such another. In his last sickness his frequent questions were, 'Whether his disease was curable? and when intimations were given, that he might have ease, but no remedy, he used this expression, 'I shall be glad to find a hole to creep out of the world at;' which are reported to have been his last sensible words; and his lying some

days following in a silent stupefaction, did seem owing to his mind more than to his body."

The reverend Mr Granger observes, that Hobbes's style is incomparably better than that of any other writer in the reign of Charles I. and was for its uncommon strength and purity scarcely equalled in the succeeding reign. "He has in translation (says he) done Thucydides as much justice as he has done injury to Homer; but he looked upon himself as born for much greater things than treading in the steps of his predecessors. He was for striking out new paths in science, government, and religion; and for removing the land-marks of former ages. His ethics have a strong tendency to corrupt our morals, and his politics to destroy that liberty which is the birthright of every human creature. He is commonly represented as a sceptic in religion, and a dogmatist in philosophy; but he was a dogmatist in both. The main principles of his Leviathan are as little founded in moral or evangelical truths, as the rules he has laid down for squaring the circle are in mathematical demonstration. His book on human nature is esteemed the best of his works."

HOBBIMA (Minderhout), an eminent landscape painter, was born about the year 1611 at Antwerp; but the master from whom he received his instruction is not known. He studied entirely after nature, sketching every scene that afforded him pleasure, and his choice was exceedingly picturesque. His grounds are always agreeably broken, and he was particularly fond of describing slopes diversified with shrubs, plants, or trees, which conducted the eye to some building, ruin, grove, or piece of water, and frequently to a delicate remote distance, every object perspectivevely contributing to delude our observation to that point. The figures which he himself designed are but indifferent, which was a defect imputable to Claude Lorraine and Gaspar Poussin as well as to Hobbima; but the latter, conscious of his inability in that respect, admitted but few figures into his designs, and those he usually placed somewhat removed from the immediate view at a prudent distance from the front line. However, most of his pictures were supplied with figures by Ostade, Teniers, and other very famous masters, which must always give them a great additional value. They are now exceedingly scarce, and industriously sought for.

HOBBY, the name of a hawk called by some authors *subbuteo*. See FALCO.

It is a hawk of the lure, and not of the fist; and is very like the saker, only much less. It makes excellent sport with net and spaniels; for when the birds see the hobby, they dare not commit themselves to the wing, but lie close to the ground, and so are taken in nets.

HOBBY is also a name formerly given to strong active horses of a middling size: they are reported to have been originally natives of Ireland, and were much liked and used. Nags answer the same description as to size, qualities, and employments.

HOBGOBLIN is a name vulgarly applied to fairies or apparitions. Skinner calls the word *robgooblins*, and derives it from Robin Goodfellow, Hob being the nick-name of Robin; but Wallis and Junius, with greater probability, derive it from *hopgoblins*, *empusa*, because

Hobgoblin.

Hoblers
||
Hody.

because they are supposed to hop without moving both their feet.

HOBLEERS, or **HOBILERS**, *Hobelarii*, in our ancient customs, were men who, by their tenure, were obliged to maintain a light horse or hobby, for the certifying any invasion towards the sea-side.—The name was also used for certain Irish knights, who used to serve as light horsemen upon hobbies.

HOB-NAIL, a nail with a thick strong head, used in shoeing a hobby or little horse.

HOB NOB, or **HAB-NAB**, a cant word formed from *hap ne hap*, and denoting an event which happens at random or by mere chance.

HOBBOO, a name given by the people of Otabeite, and in the neighbouring islands of the South Sea, to their superfine cloth. It is the thinnest and most finished preparation of the aouta.

HOBSSHEE-COFFREES, a kind of Abyssinian slaves very frequent in the empire of Hindostan. They come mostly from a province subject to the Negus of Ethiopia, called Innariah, to the south of his other dominions, and bordering upon Negroeland in Africa; from whence they are selected, and a great traffic made of them over all Mogolistan and Persia; but it is chiefly from the ports of Arabia and the Red Sea that they are brought. Nothing can be imagined more smooth or glossy, and perfectly black, than their skin; in which they far surpass the negroes on the coast of Guinea; and, generally speaking, have not any thing of their thick lips, though otherwise as woolly haired as they. They are highly valued for their courage, fidelity, and shrewdness; in which they so far excel, as often to rise to posts of great honour, and are made governors of places under the title *Siddees*.

HOBSON'S CHOICE, a vulgar proverbial expression, applied to that kind of choice in which there is no alternative. It is said to be derived from the name of a carrier at Cambridge, who let out hackney horses, and obliged each customer to take in his turn that horse which stood next the stable door.

HOCUS-POCUS, a cant expression with which the exhibitors of legerdemain tricks generally preface their feats. They are thought to be derived from that arch legerdemain trick of the Romish priests converting the sacramental bread into Deity; in which wonderful metamorphosis the words *hoc est corpus* made a conspicuous part of the ceremony, and which words may be considered as the probable root of our modern *hocus-pocus*.

HOD, a sort of tray for carrying mortar, in use among bricklayers.

HODEGOS, a term purely Greek, *οδὸς*, signifying *guide*. The word is chiefly used as the title of a book composed by Anastasius the Sinate, towards the close of the fifth century; being a method of disputing against the heretics, particularly the Acephali.

Mr Toland has also published a dissertation under the same title. Its subject is the pillar of fire, &c. which went before the Israelites as a guide in the desert.

HODGE-PODGE. See **HOTCH-POT**.

HODMAN, a cant term formerly used for a young scholar admitted from Westminster-school to be student in Christ-church in Oxford.

HODY (Humphry), a learned English divine, was born in 1659. At 21 years of age, he published his ce-

lebrated Dissertation against Aristæus's history of the 70 interpreters; which was received with great applause by all the learned, Isaac Vossius excepted, who could not bear to have his opinions opposed by such a youth. Twenty years after, he treated the subject more fully in his *De Bibliorum textibus originalibus, versionibus Græcis & Latina vulgata, libri IV*. In 1689, he wrote the *Prologomena* to John Melala's Chronicle, printed at Oxford; and the year after was made chaplain to Dr Stillfleet bishop of Worcester. The deprivation of the nonjuring bishops engaged him in a controversy with Mr Dodwell; which recommended him to archbishop Tillotson, to whom, and his successor Dr Tension, he was domestic chaplain. In 1698 he was made regius professor of the Greek tongue at Oxford, and archdeacon of Oxford in 1704. On occasion of the controversy about the convocation, he, in 1701, published A history of English councils and convocations, and of the clergy's sitting in parliament, &c. He died in 1706, leaving in MS. An account of those learned Grecians who retired to Italy on the taking of Constantinople, &c. which was published in 1742 by Dr Jebb.

HOE, or **How**, a husbandman's tool, made like a cooper's adz, to cut up weeds in gardens, fields, &c. This instrument is of great use, and ought to be much more employed than it is in hacking and clearing the several corners and patches of land in spare times of the year, which would be no small advantage to it.

Horse-Hoe a large kind of hoe drawn by horses, and used to stir the intervals in the new husbandry, and clear the corn from weeds. See **AGRICULTURE**.

HOEING, in the new husbandry, is the breaking or dividing the soil by tillage while the corn or other plants are growing thereon.—It differs from common tillage (which is always performed before the corn or plants are sown or planted) in the time of performing it; and it is much more beneficial to the crops than any other tillage. This sort of tillage is performed various ways, and by means of different instruments, as described under the article **AGRICULTURE**.

HOEI-TCHEOW, the most southern city of the province of Kiang-nan in China, and one of the richest of the empire. The people are economical and temperate, but they are active and enterprising in trade: they boast of their tea, varnish, and engravings, which are indeed the most esteemed in China. It has dependent upon it six cities of the third class; the mountains which surround this canton contain gold, silver, and copper mines.

HOEMATOPUS, in ornithology; a genus of birds, of the order of grallæ. It has a long compressed bill, with the end cuneated; the nostrils are linear, and the feet have only three toes. There is but one species, the ostralegus, sea-pie, or oyster-catcher. They are very common on most of our coasts; feeding on marine insects, oysters, limpets, &c. Their bills, which are compressed sideways, and end obtusely, are very fit instruments to insinuate between the limpet and the rock to which these shells adhere; which they do with great dexterity to get at the fish. On the coast of France, where the tides recede so far as to leave the beds of oysters bare, these birds feed on them, forcing the shells open with their bills. They keep in summer-time in pairs, laying their eggs

Hoffman
Hog.

on the bare ground: they lay four of a whitish-brown hue, thinly spotted and striped with black; and when any one approaches their young, they make a loud and shrill noise. In winter they assemble in vast flocks, and are very wild. The head, neck, scapulars, and coverts of the wings of this bird, are of a fine black; in some the neck is marked with white; the wings dusky, with a broad transverse band of white; the bill three inches long, and of a rich orange colour.

HOFFMAN, the name of several eminent physicians; of whom Maurice Hoffman, and John Maurice Hoffman his son, practised at Altorf. Maurice died in 1698, leaving behind him many works; and was succeeded by his son John Maurice, who wrote as well as his father, and died in 1727, highly esteemed by the faculty.—Frederic Hoffman, probably of the same family, was born at Magdeburg in 1660. The principal known circumstances of his life are, his journey into Holland and England, where he became intimately acquainted with Paul Herman and Robert Boyle; never taking any fees, being supported by his annual stipend; his curing the emperor Charles VI. and Frederic I. king of Prussia of inveterate diseases; to which may be added, his accurate knowledge of the nature and virtues of mineral waters. He survived his 80th year; and his works, which are in great esteem, were printed in six volumes folio at Geneva, in 1740.

HOFFMANISTS, in ecclesiastical history, denote those who espoused the sentiments of Daniel Hoffmann, professor of the university of Helmstadt, who, from the year 1598, maintained, that philosophy was a mortal enemy to religion; and that what was true in philosophy was false in theology. These absurd and pernicious tenets occasioned a warm and extensive controversy: at length Hoffmann was compelled by Julius duke of Brunswick to retract his invectives against philosophy, and to acknowledge, in the most open manner, the harmony and union of sound philosophy with true and genuine theology.

HOG, in zoology. See SUS.

Hog, on board of a ship, is a sort of flat scrubbing broom, formed by inclosing a number of short twigs of birch or such wood between two pieces of plank fastened together, and cutting off the ends of the twigs, and serving to scrape the filth from a ship's bottom under water, particularly in the act of boot-topping. For this purpose they fit to this broom a long staff with two ropes; one of which is used to thrust the hog under the ship's bottom, and the other to guide and pull it up again close to the planks. This business is commonly performed in the ship's boat, which is confined as close as possible to the vessel's side during the operation, and shifted from one part of the side to another till the whole is completed.

Hog's Dung is by Mortimer reckoned one of the richest manures we are acquainted with, and the next in value to sheep's dung; and is found to be equal in virtue to twice the quantity of any other dung except this. The ancients seem to have been displeased with it on account of its breeding weeds; but this is only accusing it of being too rich, for any dung will do this when laid too thick. It is an excellent manure for pasture-grounds, and excels all other kinds of dung

for trees. The farmers who use this dung for their lands, generally take care to save it, by well-paving the styes; and increase the quantity by throwing in bean-stalks, stubble, and many other things of a like nature: and, by good management of this kind, many farmers have procured 50 or 60 loads of excellent manure a year out of a small stye. The very best way of using this dung is by mixing it with horse-dung; and for this reason it is best to have the stye near the stable, that the two cleanings may be mixed in one heap, and used together.

They have in many parts of Staffordshire a poor, light, shallow land, on which they sow a kind of white pea: the land is neither able to bear this nor any thing else to advantage for their reaping; but, when the peas are ripe, they turn in as many hogs as the quantity of pease will fatten, suffering them to live at large, and to remain there day and night: in consequence of this, the land will produce good crops of hay for several years afterwards; or, if too poor for that, it will at worst raise grass enough to make it good pasture-ground.

Hog's Lard. See AXUNGIA.

HOGARTH (William), a truly great and original genius, is said by Dr Burn to have been the descendant of a family originally from Kirkby Thore, in Westmoreland. His father, who had been a schoolmaster in the same county, went early to London, where he was employed as a corrector of the press; and appears to have been a man of some learning, a dictionary in Latin and English, which he composed for the use of schools, being still existing in MS. He married in London; and kept a school in Ship-Court, in the Old-Bailey. Our hero was born in 1697 or 1698, in the parish of St Martin Ludgate. The outset of his life, however, was unpromising. "He was bound," says Mr Walpole, "to a mean engraver of arms on plate." Hogarth probably chose this occupation, as it required some skill in drawing; to which his genius was particularly turned, and which he contrived assiduously to cultivate. His master, it since appears, was Mr Ellis Gamble, a silversmith of eminence, who resided in Cranbourn-street, Leicester-fields. In this profession it is not unusual to bind apprentices to the single branch of engraving arms and cyphers on every species of metal; and in that particular department of the business young Hogarth was placed; "but, before his time was expired, he felt the impulse of genius, and that it directed him to painting." During his apprenticeship, he set out one Sunday, with two or three companions, on an excursion to Highgate. The weather being hot, they went into a public-house, where they had not been long before a quarrel arose between some persons in the same room. One of the disputants struck the other on the head with a quart pot, and cut him very much. The blood running down the man's face, together with the agony of the wound, which had distorted his features into a most hideous grin, presented Hogarth, who showed himself thus early "apprised of the mode Nature had intended he should pursue," with too laughable a subject to be overlooked. He drew out his pencil, and produced on the spot one of the most ludicrous figures that ever was seen. What rendered this piece the more valuable was, that it exhibited

Hog.
Hogarth.

Hogarth. hibited an exact likeness of the man, with the portrait of his antagonist, and the figures in caricature of the principal persons gathered round him.

How long he continued in obscurity we cannot exactly learn; but the first piece in which he distinguished himself as a painter is supposed to have been a representation of Wanstead Assembly. The figures in it, we are told, were drawn from the life, and without any circumstances of burlesque. The faces were said to be extremely like, and the colouring rather better than in some of his late and more highly finished performances. From the date of the earliest plate that can be ascertained to be the work of Hogarth, it may be presumed that he began business on his own account at least as early as 1720.

His first employment seems to have been the engraving of arms and shop-bills. The next was to design and furnish plates for booksellers. Mr Bowles, at the Black Horse in Cornhill, was one of his earliest patrons, whose prices were very low. His next friend in that line was Mr Philip Overton, who paid him somewhat better for his labour and ingenuity.

There are still many family pictures by Hogarth existing, in the style of serious conversation-pieces. What the prices of his portraits were, Mr Nichols strove in vain to discover; but he suspects they were originally very low, as the people who are best acquainted with them choose to be silent on that subject.

It happened, in the early part of Hogarth's life, that a nobleman who was uncommonly ugly and deformed came to sit to him for his picture. It was executed with a skill that did honour to the artist's abilities; but the likeness was rigidly observed, without even the necessary attention to compliment or flattery. The peer, disgusted at this counterpart of his dear self, never once thought of paying for a reflector that would only insult him with his deformities. Some time was suffered to elapse before the artist applied for his money; but afterwards many applications were made by him (who had then no need of a banker) for payment, without success. The painter, however, at last hit upon an expedient, which he knew must alarm the nobleman's pride, and by that means answer his purpose. It was couched in the following card: "Mr Hogarth's dutiful respects to lord —; finding that he does not mean to have the picture which was drawn for him, is informed again of Mr H.'s necessity for the money: if, therefore, his lordship does not send for it in three days, it will be disposed of, with the addition of a tail, and some other little appendages, to Mr Hare, the famous wild-beast man; Mr H. having given that gentleman a conditional promise of it for an exhibition-picture on his lordship's refusal." This intimation had the desired effect. The picture was sent home, and committed to the flames.

Mr Walpole has remarked, that if our artist "indulged his spirit of ridicule in personalities, it never proceeded beyond sketches and drawings;" and wonders "that he never, without intention, delivered the very features of any identical person." Mr Nichols assures us, from unquestionable authority, that almost all the personages who attend the levee of the Rake were undoubted portraits; and that in "Southwark Fair," and the "Modern Midnight Conversation," as many

more were discoverable. While Hogarth was painting the "Rake's Progress," he had a summer residence at Isleworth; and never failed to question the company who came to see these pictures, if they knew for whom one or another figure was designed. When they guessed wrong, he set them right.
